EVALUATION OF ACTIVE AND PASSIVE NEAR-MILLIMETER-WAVE RADIOMETRIC IMAGING TECHNIQUES FOR DETECTION OF CONCEALED OBJECTS
Earl E. Reber, Frank B. Foote, Ralph L. Schellenbaum, and Robert G. Bradley Jul. 1981 21 p refs Prepared in cooperation with Aerospace Corp., Los Angeles
(Contract DE-AC04-76DP-00789)
(DE81-031938; SAND-81-1051) Avail: NTIS HC A02/MF A01

The potential of radiometric imaging technique to detect shielded nuclear materials and explosives carried covertly by personnel was investigated. This method of detecting contraband depends upon the differences in emissivity and reflectivity of the contraband relative to human tissue. Explosives, unlike metals and metal composites, generally have high emissivities and low reflectivities that closely approximate those of human tissue making explosives difficult to detect. Samples of several common types of explosives (TNT, Detasheet, C4, and several types of water gels) were examined at the 1.4- and 3-mm wavelengths using active and passive radiometeric techniques. CHARACTERISTICS OF A CODE DIVISION MULTIPLEX CONFIGURATION WITH DIRECT MODULATION
Heinz Huebner Feb. 1980 30 p refs In GERMAN; ENGLISH summary
(Rept-442-TBr-61) Avail: NTIS HC A03/MF A01

Nature and optimal usage of signal multiplexing by direct modulation code division is described. The advantage of resulting spreading of the spectra of individual narrow band input signals over the whole frequency bandwidth of the transmission channel is pointed out. The coding and decoding signal processing is explained and signal distortion and crosstalk are discussed. It is shown that distortion free transmission without crosstalk is possible provided the code carriers are orthogonal and the signals are converted into appropriate step-shaped intermediate signals. It is demonstrated that with nonorthogonal carriers only discrete input signals can be transmitted error free. Influences of nonideal transmission channels or components were not considered. Various statistical features were extracted in real time from speech samples from speakers and then processed for automatic identification and verification. On the basis of the most reliable feature, the long term averaged spectrum, two prototypes were set up: a minicomputer system with speaker reference on magnetic card for banking applications, and a microprocessor device for automatic entry control purposes. The error rates for false rejection and false acceptance are on the order of 2%. Author (ESA)

REDUCTION OF MULTIPATH FADING IN RADIO RELAY LINKS BASED ON THE PRINCIPLE OF OPTIMUM BEAM SCAN [VERRINGERUNG VON MEHRWEGESCHWUND IN GERICHTETEN FUNKVERBINDUNGEN NACH DEM PRINZIP DER OPTIMALEN STRAHLAUSRICHTUNG]
Karl-Peter Dombek Jan. 1981 38 p refs In GERMAN; ENGLISH summary
(Rept-455-TBr-71) Avail: NTIS HC A03/MF A01

A reflector antenna with limited electronic beam scan which allowed multipath fading to be reduced and requiring neither additional frequencies nor space for an extra antenna was constructed. Multipath fading and the diversity methods currently employed for its reduction are introduced. The antifading principle is described: in the case of interference, the antenna main beam is scanned in such a way that the angles of incidence of the direct and multipath signals are within the steep slope of the main beam. The required scanning range and the principle of signal processing are explained. Simulation of the field at the receiving antenna under fading conditions allows operation to be investigated experimentally. The results fully confirm theoretical predictions. Author (ESA)

INCOHERENT SCATTER ION LINE FITTING PACKAGE

J. Murdin Jun. 1981 28 p refs
(KGI-TR-032) Avail: NTIS HC A03/MF A01

A program package for the analysis of incoherent scatter radar autocorrelation factor (ACF) measurements of ion lines is described. Input data is a suitably normalized ACF, noise corrected and corrected for the nonflat receiver frequency response (if necessary) and normalized by removal of the radar constants. Radar parameters and pulse are then delineated. Measured ACF is compared in the least squares sense to a theoretical ACF. Fit weights must be stated. The required plasma parameters that are to be adjusted in the least squares fit are selected and their initial values are chosen. The least squares fit is then implemented. Examples are worked through. Author (ESA)

SIMULATION OF A TELECOMMUNICATION DISTRESS SYSTEM Final Report

Ajmone M. Marsan, S. Benedetto, E. Biglieri, V. Castellani, L. L. Presti, and M. Pent Paris ESA Jul. 1980 160 p refs
(Contract ESTEC-3699/78)
(ESA-CR(P)-1449) Avail: NTIS HC A08/MF A01

A user oriented simulation package, TOPSIM (Torino politecnico simulator) designed for the study of communication systems is described. It allows the user to implement all the most typical system blocks through very simple and concise programming statements. It was used to analyze the distress system in the MARECS satellite. The simulation philosophy and the main building blocks of the package are outlined. A simplified approach to the theoretical analysis of the distress system is presented which shows the type of results expected. The usefulness of a simulation approach for a deeper insight into different parts of the system, is emphasized. A simulation example is given. Author (ESA)

PHONEMATIC RECOGNITION BY LINEAR PREDICTION: EXPERIMENT [RECONNAISSANCE PHONEMIQUE PAR PREDICTION LINEAIRE. L'EXPERIENCE DE L'ECOLE NATIONALE SUPERIEURE DES TELECOMMUNICATIONS (E.N.S.T.)]

Laurent Miclet, Yves Grenier, and Joel Leroux 1981 27 p refs In FRENCH; ENGLISH summary Presented at 12th Journees d'Etude sur la Parole, Montreal, May 1981
(ENST-C-81001) Avail: NTIS HC A03/MF A01

The recognition of speech signals analyzed by linear prediction is introduced. The principle of the channel adapted vocoder (CAV) is outlined. The learning of each channel model and adaptation to the speaker are discussed. A method stemming from the canonical analysis of correlations is given. This allows, starting with the CAV of one speaker, the calculation of that of another. The projection function is learned from a series of key words pronounced by both speakers. The reconstruction of phonemes can be explained by recognition factors arising from the vocoder. Automata associated with the channels are used for local smoothing and series of segments are treated in order to produce a phonemic lattice. Author (ESA)

PERFORMANCE EVALUATION OF THE VIRTUAL SUBCHANNEL CONCEPT FOR SATELLITE LINK COMMUNICATION

Guy Pujolle and Otto Spaniol (Frankfurt Univ.) Jul. 1981 31 p refs
(ENST-D-81002) Avail: NTIS HC A03/MF A01

The virtual subchannel concept which splits the satellite link into several components is analyzed and evaluated. These subchannels are assigned for transmission in cyclic order and are controlled independently of each other by the HDLC procedure. The efficiency evaluated in terms of error probability, system saturation, number of subchannels, frame length, etc., is lower than its theoretical maximum because of: (a) blocking of subchannels (due to an increased number of errors a subchannel becomes unable to accept new frames in its sender buffers), and (b) mutual blocking of subchannels: the flow control rule of the concept that any subchannel is blocked from accepting new frames if one channel is blocked by reason (a). Formulas for blocking probabilities are derived. The influence due to blocking can be neglected and efficiency tends to its theoretical maximum if a sufficient number of buffers are available. THE 94GHz PROPAGATION FACILITY AT THE YPENBURG AIRFIELD AND THE FIRST EXPERIMENTAL RESULTS

W. P. M. N. Keizer Sep. 1979 34 p refs
(PHL-1979-34; TDCK-73420) Avail: NTIS HC A03/MF A01

Attenuation at 94 GHz caused by rain was investigated for vertical polarization on a 935 m link, with four rapid response rain gages and a distrometer. The measured and the theoretically predicted rain attenuation derived from the actually measured raindrop size distribution are compared. The decrease of antenna gain at 94 GHz due to water on a 1.2 m Cassegrain antenna is discussed. It is demonstrated that for accurate propagation measurements it is necessary to equip the antennas with protective shelters. Author (ESA)

THE EFFECT OF PHASE ERRORS ON THE PERFORMANCE OF THE CAISSA ANTENNA

H. J. vanSchaik Oct. 1979 56 p
(PHL-1979-45; TDCK-73424) Avail: NTIS HC A04/MF A01

The effect of random and systematic phase errors on the performance of the CAISSA antenna, was investigated. To calculate the effect of phase deviation on performance, a random phase error distribution was adjusted to all antenna elements. It is indicated that degradation of antenna performance depends on the bounds of the phase error distribution and the position of the elements with the largest phase errors. As the total number of radiating elements increases, the influence of random phase errors decreases. Position of elements which fail is more important than quantity. It is shown that as the main lobe gets broader, gain decreases. Author (ESA)

DETECTION OF LASER RADIATION BY MEANS OF FORWARD SCATTERING IN THE ATMOSPHERE

J. A. Boden Nov. 1979 120 p refs
(PHL-1979-51; TDCK-73428) Avail: NTIS HC A06/MF A01

Scattering measurements of atmospheric aerosol size distributions for angles from 1 to 10 deg are reported. An optical tunnel was used to study forward and angular scattering. No correlation is found between variations of scatter signal and number of particles but angular scattering curves are similar to aerosol size distributions outside the laboratory. Detection distance was measured using source distance and detector field of view as parameters. For distant sources the detection limit is determined by the extinction coefficient and angular scattering function. Fraunhofer angular diffraction functions from the same aerosol size, but for different wavelenghts, are connected by the relevant Junge exponent. Author (ESA)

ESTIMATION OF THE CUMULATIVE ATTENUATION DISTRIBUTION DUE TO RAIN ON A PATH EXCEEDING 1km, GIVEN THE CUMLATIVE DISTRIBUTION DUE TO RAIN ON A PATH OF 1km

J. H. Buijs Mar. 1980 25 p refs
(PHL-1980-13; TDCK-73842) Avail: NTIS HC A02/MF A01

Methods of forecasting the cumulative attenuation distribution at 94 GHz on various path lengths, using the value obtained for a 1 km path, are discussed. Where the probability of exceeding a specific attenuation is high, a path formed by a series of n paths, each of 1 km, is likely to suffer too. Where probability is low, the probability of a high attenuation value on a 1 km path, e.g., 15 dB, is assumed to be independent of the probability of the same attenuation on the following 1 km path in the series. The probability of exceeding a high attenuation value over the total path is determined by adding the values for that specific attenuation of all n 1 km paths. Differences for values around 15 dB are shown. Knowledge of the structure of rain showers should improve accuracy and investigation of a 5 km path is recommended. Author (ESA)

TRACKING PROCEDURES FOR FUCAS
A. M. Navarro Dec. 1980 44 p refs
(Contract A74/K/077)
(PHL-1980-45; TDCK-75027) Avail: NTIS HC A03/MF A01

Tracking procedures and the observation interval adaption algorithm of FUCAS, a phased array radar system, are described. The antenna pattern has an electronically steerable pencil beam. The antenna movements are not inertia limited. The FUCAS performs high quality tracking for more than one target, or combines search and track. Energy allocation is done seperately for several tasks, range accuracy of > 3 m. The observation interval adaption algorithm keeps tracking errors constant. A change in acceleration interval is compensated by a change in the observation interval. Author (ESA)

N82-12330# Physics Lab. RVO-TNO, The Hague (Netherlands). Research Group 6: Signal Processing.
EVALUATION OF THE PERFORMANCE OF A SIMPLIFIED MTI CANCELLER SELECTION RULE FOR FUCAS
G. W. M. vanMierlo Jul. 1981 46 p refs
(PHL-1981-24; TDCK-74960) Avail: NTIS HC A03/MF A01

A rule for the selection of a particular canceller from a set forming part of the FUCAS phased array radar system, is described. The rule takes clutter and noise suppression into account instead of signal to interference ratio (SIR) at the filter outputs. For a five-pulse canceller bank, performance loss when the wrong canceller is chosen is at most, 6 db, except where clutter center velocity is midway between the two canceller stopbands. Here loss may increase to 9 db. A bank of three-pulse cancellers shows maximum performance loss of 4 db, outside the region of target suppression in the stopbands. A strong correlation is shown between variation of the canceller transmission at the target velocity, and the variation in performance loss and probability of incorrect decision. Author (ESA)

HYDROGEN AND HYDROCARBON ABSORPTION AND DESORPTION IN SENSORS WITH TRANSITION METAL GATES ON MOS CAPACITORS Ph.D. Thesis
Tommy Leroy Poteat 1981 180 p
Avail: Univ. Microfilms Order No. 8122114

A change in the work function of transition metal oxides upon absorption or desorption of hydrogen and hydrocarbon gases was utilized to fabricate and characterize sensitive gaseous detectors. These sensors were made in the MNOS device structure with transition metal gates. The substrate semiconductor used in these experiments was silicon, dielectric layers were SiOs and Si3N4. Several types of transition metal gates were obtained by evaporation and sputtering of Pd, Pt and Ni, principal method of gaseous detection was the shift in the C-V curves upon absorption and desorption. A special tracking circuit was designed to measure the change in voltage at constant capacitance during hydrogenation. Dissert. Abstr.

USE OF ON-CHIP REDUNDANCY FOR FAULT-TOLERANT VERY LARGE SCALE INTEGRATED CIRCUIT DESIGN Ph.D. Thesis
Tulin Erdim Mangir 1981 148 p
Avail: Univ. Microfilms Order No. 8121006

Use of redundancy to provide fault tolerance to manufacturing defects is studied through the use of a model for regularly designed chips. The sources of failures for MOS VLSI circuits are considered, improvement of yield with redundancy is modelled, and the techniques of bypassing defective areas on a logic chip which is designed regularly are reviewed. The emphasis is on identifying and classifying sources of failures during various stages of the lifetime of a VLSI chip, and on the development of a yield model for chips which are designed with extra (redundant) modules. Effects of various factors on yield improvement are studied. Here the emphasis has been on the effect of interconnection requirements. It is shown that, yield improvements of 100% or more over the nonredundant yields can be expected when redundancy is provided only for the logic areas. It is also observed that the improvement saturates above a certain amount (-10%) of redundancy. This indicates that the chips can be designed around an optimal amount of additional hardware on the chip to improve the yields. Dissert. Abstr.

MODULAR IMPLEMENTATION OF A DIGITAL HARDWARE DESIGN AUTOMATION SYSTEM Ph.D. Thesis
Manzer Masud 1981 182 p
Avail: Univ. Microfilms Order No. 8121928

An automation system based on AHPL (A Hardware Programming Language) was developed. The project may be divided into three distinct phases: (1) Upgrading of AHPL to make it more universally applicable; (2) Implementation of a compiler for the language; and (3) illustration of how the compiler may be used to support several phases of design activities. Several new features were added to AHPL. These include: application-dependent parameters, mutliple clocks, asynchronous results, functional registers and primitive functions. The new language, called Universal AHPL, has been defined rigorously. The compiler design is modular. The parsing is done by an automatic parser generated from the SLR(1)BNF grammar of the language. The compiler produces two data bases from the AHPL description of a circuit. The first one is a tabular representation of the circuit, and the second one is a detailed interconnection linked list. The two data bases provide a means to interface the compiler to application-dependent CAD systems. Dissert. Abstr.

N82-12334 State Univ. of New York at Stony Brook.
ON FINITE WORD LENGTH EFFECTS OF SECOND ORDER RECURSIVE DIGITAL FILTERS Ph.D. Thesis
Pei-Hwa Lo 1981 177 p
Avail: Univ. Microfilms Order No. 8120709

Factors which improve digital performance include filter structure, usage of different types of adders and calculation of scale factor. Based on the state space eigenvalue sensitivity function, a low sensitivity realization of a second order IIR filter was determined. The low sensitivity, modularity and mutual compatibility of the implemented output coefficients make this structure a good candidate for filter realization. A closed form upper bound of the filter state was found and used to determine the proper scale factor. For the uniform grid structure, it is shown that if the poles of the filter lie within a specific region, the proposed bound is better than the existing bounds. An algorithm for computing the signal to round off noise power ratio for all minimum realization configurations, is presented. Large magnitude, self-sustained, zero input limit cycle oscillations exist in a two's complement filter of canonical form. The locations of poles and the initial conditions of the filter affect the oscillation. A number of interesting properties concerning this phenomenon are investigated. Dissert. Abstr.

N82-12335 Cornell Univ., Ithaca, N. Y.
COMPUTER-AIDED SYNTHESIS AND DESIGN OF MONOLITHIC MICROWAVE INTEGRATED CIRCUITS (MMICS) Ph.D. Thesis
Louis Cho-Tai Liu 1981 199 p
Avail: Univ. Microfilms Order No. 8119462

A systematic computer aided synthesis technique of lumped lossy matching network, and a synthesis procedure of mixed lumped distributed matching network with arbitrary gain taper are presented. The exact synthesis procedure for lumped lossy matching networks presented can take arbitrary finite quality factor Q for each lumped element in the matching network. The gain bandwidth limitations of some useful lumped lossy matching networks are discussed and are summarized in a set of gain band width constraint plots. Design examples of both low noise and high power microwave broadband amplifiers using state of the art GaAs metalized semiconductor field effect transistor are presented to illustrate the synthesis and design procedure. The mixed lumped distributed matching networks are applicable monolitic microwave integrated circuits. Dissert. Abstr.

N82-12336 Colorado Univ. at Boulder.
A DESIGN PROCEDURE FOR TIME-VARYING DIGITAL FILTERS WITH HIGHLY QUANTIZED COEFFICIENTS Ph.D. Thesis
Frederick Lee Kitson 1981 165 p
Avail: Univ. Microfilms Order No. 8122298

Specific methods are given for both non-recursive and recursive structures. In both cases, the filter coefficients are periodic with period N and restricted to values of -1, 0 or + 1. Simple gain factors are also included in the recursive filters to ensure stability. It is shown that the filtering characteristics of these designs are nearly identical to those of time-invariant filters which employ 60 bit coefficient precision. The limitations of periodic time-varying finite impulse response filters with coefficients -1, 0 and + 1 were investigated. These filters were reformulated as N parallel time-invariant filters with commutating input switching. It was demonstrated that the time-varying filter design can sometimes lead to time-invariant structures having similar quantization. Dissert. Abstr.

N82-12337 Cornell Univ., Ithaca, N. Y.
NONUNIFORMLY DOPED GALLIUM ARSENIDE MICROWAVE POWER MESFETS Ph.D. Thesis
Seno Jadaprawira 1981 137 p
Avail: Univ. Microfilms Order No. 8119467

Nonuniform doping profile GaAS microwave power metallized semiconductor field effect transistors (MESFET) structures were investigated to explore the effects of various doping profiles on device charcteristics. Using molecular beam epitaxial materials, microwave power MESFETs with exponential, impulse, delta function as well as uniform doping profiles were fabricated. Device characteristics were examined at DC as well as at microwave frequencies. The nonuniformly doped MESFETs were found to have inferior field distribution which lead to smaller drain current capability. The drain-source burnout voltage was not affected, however, provided the full channel current was properly chosen. Burnout voltage of 45 volts was routinely obtained independent of the doping profile. graded doping profiles were found to be most effective in improving a MESFET's linearity when the operating power level was well below the saturated power of the device. At large signal application, the advantage was significantly smaller. Hence the graded doping profile FETs are most useful for very linear operation but less so for the applications where larger power is more important than the linearity. Dissert. Abstr.

N82-12338 Iowa State Univ. of Science and Technology, Ames.
APPLICATION OF KALMAN FILTERING IN COMPUTER RELAYING OF POWER SYSTEMS Ph.D. Thesis
Adly Ageeb Girgis 1981 214 p
Avail: Univ. Microfilms Order No. 8122515

Kalman filter models for the optimal estimation of the post-fault currents and voltages for computer relaying purposes of power systems are presented. As a prerequisite for the Kalman filtering implementation, the random description of the fault-induced noise signals was quantitatively studied. Empirical formulas that describe the random nature of the noise based on the probability of fault location and the frequency of occurrence of the difference types of faults are given. These empirical formulas offer the possibility of developing other techniques in computer relaying of power systems. Sensitivity of the Kalman filers to incorrect model parameters was studied through extensive simulation. A Kalman-filtering-based digital distance relay was designed to detect, classify, and locate faults in a high voltage transmission line in the shortest period of time. Comparison of the developed technique with four other algorithms demonstrated that the Kalman-filtering-based algorithm is superior to other techniques in the rate of convergence to the exact values, accuracy, and computer burden. Thus the Kalman filtering approach appears to be especially well-suited to the power system protection problem. Dissert. Abstr.

N82-12339 California Univ., Los Angeles.
SMALL-CHANNEL EFFECTS IN CHARGE-COUPLED DEVICES Ph.D. Thesis
John Yuantai Chan 1981 227 p
Avail: Univ. Microfilms Order No. 8120932

A two dimensional empty-well model is developed to calculate the potential barrier height for various interelectrode gap lengths in an overlapping CCD structure. The barrier height limits the charge handling capacity in short channel CCDs. A simple measurement technique is developed to obtain experimental data using submicrometer test devices, and the data are compared with the model. Several important process parameters relating to the barrier lowering are investigated for design consideration. Both short-channel and narrow-channel effects are investigated. Theoretical and experimental work are carried out to understand important CCD characteristics such as charge-handling capacity, charge transfer efficiency, and dark current in reduced geometry devices. Dissert. Abstr.

N82-12340 Illinois Univ. at Chicago Circle, Chicago.
THE STABILITY AND SOLDERING VOID EFFECT OF LARGE SUPERCONDUCTOR Ph.D. Thesis
Yuchi Huang 1981 235 p
Avail: Univ. Microfilms Order No. 8120567

A test facility was designed and set up for the investigation of superconductor performance and superconducting magnet safety under both steady-state and transient conditions. The conductor for the superconducting magnetohydrodynamic dipole magnet for the Coal-Fired-Flow-Facility at the University of Tennessee Space Institute was tested. The result showed that the superconductor performance test facility was properly set up and highly serviceable. The effect of the soft soldering void between the superconducting cable and the copper stabilizer of the MHD superconductor was investigated experimentally and theoretically. In the theoretical simulation mode, an equation for critical void length was analytically obtained. The electrical equation and heat balance equations were also solved by using the backward difference method. Both experimental test results and numerical analysis results showed that the recovery characteristics were strongly dependent on the void length. Dissert. Abstr.

N82-12341 Rensselaer Polytechnic Inst., Troy, N. Y.
IMPLEMENTATION OF SAW CHIRP TRANSFORM AND SAW CONVOLVERS IN SPREAD SPECTRUM COMMUNICATION SYSTEMS Ph.D. Thesis
Dan Abraham Shklarsky 1981 161 p
Avail: Univ. Microfilms Order No. 8121163

Surface Acoustic Waves (SAW) signal processing devices are attractive for use in wide-band communication systems, specifically in large TB spread spectrum systems. Three ideas in which SAW elements are implemented to improve the performance of spread spectrum communication system are discussed: an adaptive narrow-band interference suppressor, the introduction the Hilbert transformed carrier sequence to double that data rate of a given spread spectrum system, and a time integrating correlation (TIC) which is insensitive to Doppler shifts of the carrier frequency. In the narrowband suppressor, real time SAW chirp Fourier transformers are the main elements of the system in which the Fourier domain signals are going through an adaptive notch filtering process which identifies, locates and suppresses possible narrow-band interference sources. The result is a system which can increase the effective compression gain of a given spread spectrum system whenever narrow-band interference sources exist. Dissert. Abstr.

N82-12342 Rensselaer Polytechnic Inst., Troy, N. Y.

THE EFFECT OF OPTICALLY ENHANCED LEAKAGE CURRENT ON S-BAND TRAPATT DIODE OSCILLATORS Ph.D. Thesis

April Marie Schweighart 1981 239 p

Avail: Univ. Microfilms Order No. 8121162

The effects on output power and frequency of oscillation are presented and compared with a theoretical, closed form model. In general, the power decreases gradually and the frequency increases rapidly with photocurrent at low levels, while the power decreases rapidly while teh frequency levels off a higher levels of photocurrent. These results, however, are found to be very dependent on the tuning of the TRAPATT device. The design and fabrication of unique top ring contact N(+)PP(+) silicon devices was made to permit optical excitation. The devices were mounted junction side up with the top metal contact having an optical window to allow the light to shine directly on the silicon surface, and thus generate photocurrent. The two-dimensonal effects inherent in this structure were found to be negligible from passive RF tests. Dissert. Abstr.

N82-12343 Houston Univ., Tex5.

ELECTROSTATIC LENSES OF THE ANTISYMMETRIC QUADRUPOLE AND SYMMETRIC OCTUPOLE QUADRUPLET Ph.D. Thesis

Leon Fa-Lian Cheng 1981 170 p

Avail: Univ. Microfilms Order No. 8120903

Electrostatic quadrupole octupole lens systems are studied to focus a cone of electron beams emanating from a point source. The half angle of emission is 0.01 radian and the accelerating voltage is 10 KV. These are desirable parameters for a beam lithography. An antisymmetric quadruplet simulates a round lens which gives a regular image with the capability of aberration correction. The analytical solution for trajectories is obtained by assuming an ideal hyperbolic field and by neglecting the second-order effects such as the fringe-field, local voltage, and relativistic effect. An initial guess of the sign parameters is provided. For the real case design, a successive over relaxation technique is used to solve Laplace's equation for potential distribution in three dimensional cylindrical coordinates. The boundary values are imposed around the primary region which is the first 45 deg for a quadrupole and the first 22.5 deg for an octupole. Dissert. Abstr.

N82-12344*# TRW Defense and Space Systems Group, Redondo Beach, Calif.

S-BAND SHALLOW BULK ACOUSTIC WAVE (SBAW) MICROWAVE SOURCE Final Report

Jul. 1981 44 p refs

(Contract NAS5-26002)

(NASA-CR-166744) Avail: NTIS HC A03/MF A01 CSCL 09C

Techniques necessary to fabricate a high performance S-band microwave single source using state-of-the-art shallow bulk acoustic wave (SBAW) were explored. The bulk wave structures of the AlN/Al 2O3 were investigated for both the R plane and basal plane of sapphire. A 1.072 GHz SBAW delay line and oscillators were developed. A method of selecting and setting oscillator output frequency by selecting substrate orientation angle was also established. B.W.

MULTIPLE-BEAM, HIGH-POWER, PRECISION POINTING ANTENNA SYSTEM Patent Application

Kenneth E. Woo (JPL, California Inst. of Tech., Pasadena) and Paul W. Cramer, Jr., inventors (to NASA) (JPL, California Inst. of Tech., Pasadena) Filed 30 Oct. 1981 16 p

(Contract NAS7-100)

(NASA-Case-NPO-15406-1; US-Patent-Appl-SN-315585) Avail: NTIS HC A02/MF A01 CSCL 09C

An antenna with a plurality of beams that can be electronically steered simultaneously in unison is described. The beams may be steered independently. A relatively small phased array of antenna elements feeding a near field dual reflector system is used to magnify the aperture of the feed array to that of the main reflector thereby providing high gain. The main reflector and the subreflector are shaped reflectors which may be confocal paraboloids having nominally the some focal length to diameter ratio, although the subreflector may be oversized. The array feed is placed so that the subreflector is in the near field of feed. S.L.

PHASE SENSITIVE GUIDANCE SENSOR FOR WIRE-FOLLOWING VEHICLES Patent Application

George R. Hansen (JPL, California Inst. of Technology, Pasadena) Filed 30 Oct. 1981 15 p

(Contract NAS7-100)

(NASA-Case-NPO-15341-1; US-Patent-Appl-SN-315583) Avail: NTIS HC A02/MF A01 CSCL 09C

A guidance sensor for a wire-following vehicle which is phase sensitive is described. The sensor includes an array of coils positioned to sense the vertical component of a magnetic field produced by the AC current through the guidance wire. The outputs of the coils are fed to associated flip flops. Flip flops associated with coils, through which flux passes in one direction, e.g., up, are driven to one state, e.g., true, and flip flops associated with coils through which flux passes in the opposite direction, e.g., down, are driven to a false state. The control signal to guide the vehicle to be over the wire is a function of the number of flip flops in the true state. Circuitry is included to prevent flip flops from assuming a wrong state due to noise. NASA

HIGH-FREQUENCY HIGH-VOLTAGE HIGH-POWER DC-TO-DC CONVERTERS

Thomas G. Wilson, Harry A. Owen, Jr., and Paul M. Wilson 1981 11 p refs Presented at the U.S.-Japan Sci. Seminar on Analysis and Design in Power Electron., Kobe, Japan, 25-28 Nov. 1981

(Grant NsG-3157)

Avail: NTIS HC A02/MF A01 CSCL 09C

The current and voltage waveshapes associated with the power transitor and the power diode in an example current-or-voltage step-up (buck-boost) converter were analyzed to highlight the problems and possible tradeoffs involved in the design of high voltage high power converters operating at switching frequencies in the range of 100 Khz. Although the fast switching speeds of currently available power diodes and transistors permit converter operation at high switching frequencies, the resulting time rates of changes of current coupled with parasitic inductances in series with the semiconductor switches, produce large repetitive voltage transients across the semiconductor switches, potentially far in excess of the device voltage ratings. The need is established for semiconductor switch protection circuitry to control the peak voltages appearing across the semiconductor swtiches, as well as to provide the waveshaping action require for a given semiconductor device. The possible tradeoffs, as well as the factors affecting the tradeoffs that must be considered in order to maximize the efficiency of the converters are enumerated. A.R.H.

X-RAY EMISSION OF HIGH VOLTAGE VACUUM DEVICES Ph.D. Thesis

D. Dohnal 1981 175 p refs In GERMAN; ENGLISH summary

Avail: NTIS HC A08/MF A01

The X-ray emission of vacuum arrangements, especially of vacuum circuit breakers, is reported at voltages up to 140 kV. The theoretical relationship between X-ray generation and the measurement of dose quantities is discussed. Various processes of electrode conditioning were analyzed. In the predischarge phase at d.c. voltage the relationship between X-rays and electrical values was studied, considering the influence of a large number of parameters, such as electrode material, electrode curvature and surface roughness. The effects at a.c. voltage are specified and compared with the results obtained at d.c. voltage. The experimental results offer a large range of applications for X-rays as a means of diagnosis. Some of these possibilities are discussed. T.M.

A SIMPLIFIED POWER FACTOR CONTROLLER WITH INCREASED ENERGY SAVING CIRCUIT Patent Application
Frank J. Nola, inventor (to NASA) Filed 28 Aug. 1981 12 p
(NASA-Case-MFS-25323-1; US-Patent-Appl-SN-297524) Avail: NTIS HC A02/MF A01 CSCL 09A

A device which controls the power input to an induction motor by controlling the power of the motor is disclosed. Two features of the device increase its sensitivity under conditions where the motor is unloaded in order that full control operation is possible with the device adjusted to operate with the power input just sufficient to sustain motor operation. A feedback circuit comprising of a resistor, which feeds back to a summing junction from a signal point at which a triac control signal appears. The requirement that motor current be directly sampled in the process of determining the power factor of the power input to a motor is eliminated. S.L.

EVALUATION OF CATHODE-RAY TUBE PROTECTION FOR THE ELECTRONIC TABULAR DISPLAY SUBSYSTEM (ETABS) ENGINEERING MODEL Final Report, Jan. 1980 - Jan. 1981
Anthony R. Wilson Sep. 1981 17 p refs
(AD-A105199; FAA-CT-81-66; FAA-RD-81-26) Avail: NTIS HC A02/MF A01 CSCL 09/1

This report describes the safety evaluation of the 25-inch (diagonal) rectangular cathode-ray tube (CRT) that is used in the engineering model of the Electronic Tabular Display Subsystem (ETABS). An evaluation of ETABS will be performed at the Federal Aviation Administration (FAA) Technical Center for possible application in FAA Air Route Traffic Control Centers (ARTCC). The safety evaluation included standard industry pressure testing and special implosion testing on 12 CRT samples. Eleven of the twelve CRT samples satisfactorily met the safety requirements for both the pressure and implosion testing. One CRT cracked when subjected to 45 pounds per square inch (psi) of air pressure; however, the CRT did not implode. The 25-inch rectangular CRT will therefore provide a high degree of safety for use in each of the two tabular displays of the ETABS engineering model. Author (GRA)

A SYSTOLIC 2-D CONVOLUTION CHIP Interim Report
H. T. Kung and S. W. Song Mar. 1981 13 p refs
(Contract N00014-76-C-0370; N00014-80-C-0236; F33615-78-C-1551; Grant NSF MCS-78-23676)
(AD-A104872; CMU-CS-81-110) Avail: NTIS HC A02/MF A01 CSCL 09/5

This paper describes a chip for performing the 2-D (two-dimensional) convolution in signal and image processing. The chip, based on a systolic design, consists of essentially only one type of simple cells, which are mesh-interconnected in a regular and modular way, and achieves high performance through extensive concurrent and pipelined use of these cells. Denoting by u the cycle time of the basic cell, the chip allows convolving a kxk window with an nxn image in O(sq m)(u/k) time, using a total of cu k basic cells. The total number of cells is optimal in the sense that the usual sequential algorithm takes O(sq m)(sq k) (u) time. Furthermore, because of the modularity of the design, the number of cells used by the chip can be easily adjusted to achieve any desirable balance between I/O and computation speeds. Author (GRA)

SILICON-ON-SAPPHIRE MEDIUM POWER MESFET Interim Report
Feb. 1981 10 p
(Contract N00014-80-C-0862)
(AD-A105378) Avail: NTIS HC A02/MF A01 CSCL 09/1

The key aspect in improving the performance of SOS MESFETs is to reduce the parasitic source resistance. While the extrinsic g sub m of GaAs MESFETs is now close to that of the intrinsic device (i.e., with R sub S = R sub D = 0), SOS MESFETs still have significant progress to be made in the area of source resistance reduction. The source resistance can be most effectively reduced by spacing the gate closer to the n(+) source implant. The smallest spacing is then determined by the gate-to-source breakdown voltage. GRA

ANALYSIS OF COAXIAL EMI FEEDTHROUGH FILTERS CONTAINING FERRITE ELEMENTS Interim Report
G. H. Stauss, J. J. Krebs, and W. G. Maisch 16 Oct. 1981 33 p
(XF43453401)
(AD-A105248; NRL-MR-4651) Avail: NTIS HC A03/MF A01 CSCL 09/5

An analysis of coaxial EMI (Electromagnetic Interference) feedthrough filters containing high permeability ferrite and high permittivity dielectric elements is given. The frequency dependent complex permeability and permittivity of useful materials are modeled, and the effect of these parameters as well as load and source impedance, filter dimensions and number of filter elements on the insertion loss behavior are investigated. Filter problems are treated as are suggestions for improved performance. GRA

FEASIBILITY STUDY OF DEVICE SYNTHESIS OF NON-LINEAR FILTERS Final Report, 1 Mar. 1976 - 31 May 1981
R. S. Bucy and W. H. Steier May 1981 19 p refs
(Contract F44620-76-C-0085; AF Proj. 2305)
(AD-A105417; AFOSR-81-0665TR) Avail: NTIS HC A02/MF A01 CSCL 09/5

Efforts to date have shown that with careful tailoring to the problem at hand and by taking maximum advantage of recent advances in parallel/pipeline array processor architecture, the nonlinear filter is a practical estimation technique. The computational effort is signifcantly greater than for conventional linear or linearized (e.g., extended Kalman filtering) techniques, but the performance advantage may be significant where the observation is a significantly nonlinear function of the estimated states, and/or where the observation noise (or plant noise) is significantly non-Gaussian. The research has concentrated on the phase estimation problem which has proven to be an ideal test problem. However, with the techniques that have now been developed and proven, it is appropriate to consider a larger class of problems. Potential applications should meet the following criteria: (1) Performance advantages are of significant economic value, (2) Observations are essentially nonlinear functions of the states that have to be estimated where the linear filter leads to unacceptable performance, (3) Measurement (or state) noise is highly non-Gaussian. Excellent example meeting all the above criteria would be the ELF communications problem. Other examples occur in deep space communication and in detection and tracking problems in general. (Contract N00014-80-C-0071)
(AD-A105198; ARACOR-FR-81-53) Avail: NTIS HC A05/MF A01 CSCL 13/8

A detailed evaluation of the quality of silicon wafers from representative domestic and foreign vendors was made. To avoid pre-selection of wafers by vendors, material was obtained directly from device manufacturers and therefore represents a statistical sampling of Si material as currently being used in production-line processing. The results of this study have shown extreme batch-to-batch variability, lack of control in material quality and, in many cases, unacceptable levels of defects in silicon wafers used in manufacturing. The development of front-and-back-surface

laser-gettering procedures for improving quality is reported and newly developed techniques for stabilizing back-surface damage, using the enhanced diffusion of oxygen, are discussed.

FIELD EMISSION COLD CATHODE DEVICES BASED ON EUTECTIC SYSTEMS Final Technical Report, 1 May 1977 - 31 Dec. 1979
Duncan Stewart, Vivian G. Rivlin, and Paul D. Wilson Jul. 1981 117 p refs
(AD-A104795; RADC-TR-81-170) Avail: NTIS HC A06/MF A01 CSCL 09/1

A survey has been made of the performance as field emission cold cathodes of selected refractory materials fabricated as needle arrays by unidirectional solidification. Cathodes based upon refractory metal carbides have been fabricated and tested. Performance data has been obtained using niobium, tantalum and vanadium carbides with various cathode geometries. Life times of over 1,000 hours and current densities of up to 1 A/sq. cm. have been obtained. Preliminary experiments indicated the LaB6 can be formed into platelets by conventional cooling in an aluminum matrix and that directional solidification should produce suitable rod-like morphology.

LOW-LOSS FIBER WAVEGUIDES Annual Technical Report, 1 Aug. 1980 - 30 Jun. 1981
J. A. Harrington Sep. 1981 56 p refs
(Contract N00014-79-C-0691)
(AD-A104943) Avail: NTIS HC A04/MF A01 CSCL 09/1

This annual report summarizes our second year of effort to fabricate low-loss fiber waveguides with potential loss near 10 to the minus 3 dB/km. To develop such low-loss waveguides, we have used alkali and thallium halides to form poly- and single-crystal fibers. To date our best polycrystalline KRS-5 (T1BrI) fiber remains 5 orders of magnitude above the goal of 10 to the minus 3 dB/km.

PIEZOELECTRIC ZnS FILM ON SILICON Final Report, 1 Nov. 1979 - 31 Oct. 1980
Edward J. Staples Jun. 1981 26 p refs
(Contract F49620-79-C-0022; AF Proj. 2306)
(AD-A105161; ERC41018.3FR; AFOSR-81-0682TR) Avail: NTIS HC A03/MF A01 CSCL 09/5

The objective of the present research investigation is to theoretically analyze the electromechanical coupling of piezoelectric zinc sulfide films on silicon substrates. During the past twelve months, considerable efforts have been made in analyzing the experimental results which were obtained in FY 1979. In order to accomplish this, a computer program was written to calculate surface-acoustic-wave electromechanical coupling constants for layered media. The calculation included four configurations of the excitation of surface acoustic waves in different orientations of silicon using cubic and hexagonal ZnS films. The calculated results showed that the best acoustic coupling for ZnS films is 0.0001 which is an order of magnitude smaller than ZnO films on silicon. Also included in this report is the calculation of ZnO films on fused quartz and various orientation of silicon.

This report covers a program on the development of a planar GaAs digital integrated circuit (IC) technology. The main goals of this program were the development and implementation of the fabrication technology, and the demonstration of the feasibility of reaching large-scale integration (LSI) with high-speed, low-power GaAs digital ICs. In approximately 3 1/2 years a planar fabrication process was developed and refined. The program started with the fabrication of the first planar FET transistors using the new process, and the demonstration of Schottky diode-FET logic (SDFL) gates, showing high speed operation of ring oscillators. After this initial stage, many logic circuits have been built. The complexity of these demonstration circuits, involving both combinatorial and sequential logic, grew at a nearly exponential rate. Among the most complex circuits fully demonstrated is a 5 x 5 bit parallel multiplier employing 260 SDFL gates.

ADVANCED ELECTROFLUIDIC SERVOVALVE DEVELOPMENT Final Report, Apr. 1980 - Apr. 1981
Lester K. Pecan Fort Eustis, Va. Applied Technology Lab. Aug. 1981 47 p
(Contract DAAK51-80-C-0017; DA Proj. 1L1-62120-AH-25)
(AD-A105172; USAAVRADCOM-TR-81-D-30) Avail: NTIS HC A03/MF A01 CSCL 09/5

This report covers the advanced development of an electro fluidic servovalve. This device accepts and sums electrical and hydraulic inputs and provides an output capable of accurately positioning a hydraulic actuator. The design employs fluidic amplifiers with rotating movable flow splitters, an actuator piston feedback mechanism, and a unique positive derivative feedback circuit. The need for adequate actuator flow is met by use of a spool valve to augment the driving amplifier output. The positive derivative feedback circuit controls spool response, so that flow to the actuator is proportional to actuator velocity. Demonstration tests of the final design showed satisfactory performance of the rotary splitter concept, and an order-of-magnitude increase in servovalve frequency response through use of derivative feedback.

STUDY OF THE EMISSION PERFORMANCE OF HIGH-POWER KLYSTRONS: SLAC XK-5
Yong-xiang Zhao Jul. 1981 51 p refs
(Contract DE-AC04-76SF-00515)
(DE81-030177; SLAC-TN-81-5) Avail: NTIS HC A04/MF A01

There are hundreds of high power klystrons operated in the Linac gallery and about fifty to sixty tubes fail every year. The lifetime ranges from a few thousand up to seventy thousand hours except those which fail during an early period. The overall percentage of failures due to emission problems is approximately 25 percent. It is also noted that a 10 percent increase in mean lifetime of klystrons will reduce the overall cost per hour as much as a 10 percent increase in efficiency. Therefore, it is useful to find some method to predict the expected life of an individual tube. The final goal has not been attained yet, but some useful information was obtained. It is thought that this information might be helpful for those people who will study this subject further.

SUPERCONDUCTIVITY IN Th-Nb COMPOSITES Ph.D. Thesis
Loren Frederick Goodrich 1980 144 p refs
(Contract W-7405-eng-82)
(DE81-030746; IS-T-926) Avail: NTIS HC A07/MF A01

Heat capacities, critical temperatures and critical currents have been measured for directionally solidified eutectic Th-Nb wires in order to determine whether superconductor-normal metal boundary is a strong pinning center for quantized vortices. The het capacity data show that there is a large change in pair potential at the super-normal boundaries as predicted by de Gennes boundary conditions. The T/sub c/ data were used to evaluate the extrapolation length b, and to show that Ginsburg-Landau predicts the changes in the superconductors rather well. Hence, the equilibrium thermodynamical properties are predicted from the filament size and spacing rather well. DOE

A frequency analog monolithic pressure sensor was developed. The doping and temperature dependence of the piezo-coefficients were measured and the arrangement of the resistors on the diaphragm was optimized. Based on the use of I(2)L ring oscillators in frequency analog sensors, a two-wire measurement system was developed for multisensor applications. For noncontact temperature measurements, a thin film bolometer with a risetime of 6 msec was fabricated. An ion implanted Al2O3 humidity sensor with linear output characteristics was also developed. Low cost microprocessor controlled analog to digital conversion methods were investigated together with the linearization and approximation of sensor output characteristics. Author (ESA)

The physical and physicochemical properties of tungsten oxide layers which are important for display applications are elucidated: the electrochromic switching behavior, particularly the ion transport mechanism, and the stability and aging effects. A solution of these problems implies a systematic analysis of the structure of the thermally evaporated tungsten oxide layers used for electrochromic displays. By variation of the evaporation conditions and by studying the film structure it was possible to find out the structure of thermally evaporated layers as well as the principles of the ion transport mechanism. HC A03/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 8,65

A substantially improved procedure for the fabrication of SiC-LED's (maximum wavelength 475 nm) by liquid phase epitaxy on 6 H silicon carbide substrates is described. The quantum efficiency of encapsulated diodes is increased to 1.2 x 10E-4. The reproducibility of fabrication is improved by refined substrate control and preparation techniques. The epitaxial process is simplified, the surface of the layers is improved and doping concentrations are optimized. Reliable bonding of contacts is achieved. Diced chips show a decrease in quantum efficiency and a green shift of the emission spectrum, even under low current density conditions. This effect is avoided by mesa etching and an improved mounting technique. Author (ESA)

RADIATIVE HEAT TRANSFER IN EMITTING, ABSORBING AND ANISOTROPICALLY SCATTERING PARTICULATE CLOUDS Ph.D. Thesis
Farzin Homayoun Azad 1981 193 p
Avail: Univ. Microfilms Order No. 8121136

Radiative heat transfer in emitting, absorbing and anisotropically scattering media. The validity of the well established differential approximation to the case of anisotropic scattering is extended. Furthermore, the influence of highly anisotropic Mie scattering is investigated. Exact solutions for temperature distribution and radiative flux are found for scattering phase functions with up to 35 terms in their Legendre polynomial series expansion and are used as basis for comparison of linear anisotropic and differential approximation models. In dealing with anisotropic scattering in cylindrical media, and exact solution is developed, resulting in a first order integral equation. Also, two approximate methods are developed and tested for their accuracy. Dissert. Abstr.

N82-12373 Arizona Univ., Tucson.
HEAT TRANSFER IN A FIXED BED AND MASS TRANSFER IN A COUNTER-CURRENT MOVING BED Ph.D. Thesis
Filho Osmario Dellaretti 1981 138 p
Avail: Univ. Microfilms Order No. 8120721

The behavior of gas-solid reactors known as compact-fixed and moving beds, is analyzed from a theoretical viewpoint. For a compact fixed-bed the solution of the energy balance equations is obtained for the cases of a uniform temperature inside the solid pellets (i.e., the Biot number is zero) and for the case in which there are temperature gradients within the pellets (Bi > 0). For short contact times, beds with Bi > 0 have gas- and solid- temperatures which are greater than the temperatures within beds with Bi = 0. For long times, the situation is reversed. For a compact-moving bed the solution of the mass balance equations is obtained for the cases of a feed-solid with an oscillating concentration. For both types of beds there is an equivalence between mass transfer and energy transfer so that the solutions can be interchanged with suitable definitions of dimensionless variables. Dissert. Abstr.

N82-12374 Lehigh Univ., Bethlehem, Pa.
SELF-SUSTAINED OSCILLATIONS OF A MIXING LAYER. EDGE SYSTEM Ph.D. Thesis
Samir Refaat Ziada 1981 242 p
Avail: Univ. Microfilms Order No. 8118853

Velocity measurements using hot film anemometry, flow visualization using hydrogen bubble and dye injection techniques, and simultaneous recording of the force exerted on the wedge were employed to explore the globally organized nature of the mixing layer-wedge interaction. Velocity perturbations at the separation location are intimately related to the force exerted on the wedge and grow exponentially downstream with growth rates in close agreement with the linear stability theory. Higher harmonics of the fundamental mode are generated near the critical layer of the mixing layer while the disturbance amplitude is still small. Vortex-wedge interaction mechanisms and the amplitude of the force exerted on the wedge are a strong function of he transverse offset between the leading edge of the wedge and the center of the incident vortex. A special case of 'resonance' was also investigated, in which the subharmonic mode is coupled with a free surface wave phenomenon, resulting in a process of consistant vortex pairing upstream of the impingement wedge. Dissert. Abstr.

GENERALIZED STUDY OF A HYDRAULICALLY ACTUATED MECHANISM SYSTEM Ph.D. Thesis
Viswanathan Venkatraman 1981 390 p
Avail: Univ. Microfilms Order No. 8122207

A composite system consisting of the mechanism and the actuator is considered with emphasis on the interaction between the two important subsystems. A mathematical model based on the lumped parameter system is formulated and a set of dimensionless nonlinear state equations representing the dynamics of the composite system is derived. All the significant system parameters, namely, mechanical inertia, load, Coulomb friction, viscous damping, fluid capacitance, fluid inertia, leakage and fluid resistance are accounted for in the model. System analysis techniques in the time domain are applied and the behavior of the system is studied. It is shown that the behavior of the mechanism actuator system is controlled by certain dimensionless system parameters. Dissert. Abstr.

PREDICTION OF THE INCOMPRESSIBLE FLOW OVER A REARWARD-FACING STEP Ph.D. Thesis
O Key Kwon 1981 335 p
Avail: Univ. Microfilms Order No. 8122533

A viscous inviscid interaction scheme is presented for computing steady, two dimensional, incompressible, laminar, and turbulent flows over a rearward-facing step. The boundary layer equations for the region of viscous flow and the Laplace equation for streamfunction in the region of inviscid flow are used. The boundary layer continuity and momentum equations are solved inversely in a coupled manner using an improved finite-difference calculation procedure. Consideration is given to the applicability of the boundary layer equations to two dimensional channel expansion flows with developed inlet velocity profiles. No inviscid flow region can be identified so that the viscous inviscid interaction procedure is not applicable. Predictions of laminar flows of this type using the inverse boundary layer numerical method are shown to be in agreement with existing Navier-Stokes solutions and experimental measurements. Dissert. Abstr.

DEPOSITION OF PARTICLES IN VERTICAL CONDUITS DUE TO ELECTROSTATIC CHARGE, DIFFUSION, AND GRAVITY Ph.D. Thesis
Melvin Wilbur Gelber 1981 99 p
Avail: Univ. Microfilms Order No. 8121967

The effect on the deposition of fine particles in a vertical channel and in a vertical tube due to the influence of electrostatic charge, diffusion, and gravity acting in the direction of flow is investigated. The flow considered was laminar, incompressible and steady. The flow patterns considered were uniform, developing and fully developed with symmetry about the axis of the channel or tube. Dissert. Abstr.

N82-12378 State Univ. of New York at Stony Brook.
EXPERIMENTAL AND ANALYTICAL STUDY OF NATURAL CONVECTION HEAT TRANSFER OF INTERNALLY HEATED FLUIDS Ph.D. Thesis

George Alanson Greene 1981 137 p
Avail: Univ. Microfilms Order No. 8121481

Boundary heat transfer from a liquid pool with a uniform internal heat source to a vertical or inclined boundary was investigated. In an open rectangular liquid pool in which the internal heat source was generated by electrical heating. The local heat flux was measured to a boron nitride test wall which was able to be continuously inclined from vertical. Under the assumption of laminar natural convection, it was found that the local heat transfer data could be empirically correlated by the relation Nu(x) = 0.153 Ra(x) to the 0.25 power with a standard deviation in the coefficient of + or - 14%, and the average heat transfer data could be empirically correlated by bar Nu = 0.127Ra(L) to the 0.25 power with a standard deviation in the coefficient of + or - 8%. The component of the gravitational acceleration along the wall, was found to help account for the inclination of the boundary although some systematic effect was still evident in the data. Dissert. Abstr.

N82-12379 State Univ. of New York at Buffalo.

ANALYTICAL SOLUTION OF ANISOTROPIC HEAT CONDUCTION IN SIMPLE AND IRREGULAR REGIONS Ph.D. Thesis

Shyan-Cherng Huang 1981 416 p
Avail: Univ. Microfilms Order No. 8122172

The general theory of heat conduction in anisotropic media homogeneous in rectangular Cartesian coordinates is first presented in a systematic manner through the use of coordinate transformation and Green's functions. The Levi's function and its extension in the theory of partial differential equations are derived. Several problems which cannot be solved straightforwardly by standard techniques in the solutions of isotropic problems are solved exactly. Two-dimensional steady-state problems in arbitrarily shaped regions are solved by the use of approximate Green's functions. Variational method is employed for unsteady state problems. The limitations of its applicability to general boundary and initial conditions are discussed by numerical examples. Exact solutions of number of steady and unsteady state problems with mixed-type boundary conditions are obtained. The Wiener-Hopf technique is applied. The accuracy of the kernel approximation is discussed. Dissert. Abstr.

THE TRANSITION FROM DEFLAGRATION TO DETONATION Ph.D. Thesis

Donald Scott Stewart 1981 209 p
Avail: Univ. Microfilms Order No. 8119439

A unified, mathematical description of all steady, one-dimensional combustion waves, deflagrations and detonations, and the unsteady flame acceleration process inherent in DDT is presented. A set of equations governing one-dimensional, unsteady combustion using the mathematical limit in which the activation energy of Arrehnius kinetics becomes large compared to the thermal energy of the gas were analyzed. The problem posed by activation-energy asymptotics (AEA) is discussed generally and in the simpler, particular case where the heat release during chemical reaction is small. Dissert. Abstr.

A STUDY OF TIME EVOLUTION OF CONTINUOUS VORTEX LOOPS IN A HOMOGENEOUS OR STRATIFIED FLUID Ph.D. Thesis

Chiou-Hsin Peter Cheng 1981 93 p
Avail: Univ. Microfilms Order No. 8120149

A numerical study was made to simulate the time evolution of a series of vortex loops in a homogeneous or stratified fluid. The physical models for vortex structure in the wake of a three dimensional body are presented and investigated. The closed-end double helix is found to be a reasonable representation of the vortex structure behind a three-dimensional body. An existing self-consistent theory of vortex loops is applied and the vortex structure is conceived as vortex loops resembling the configuration of a closed-end double helix. It was found that the vortex structure in the wake of a spanwise elongated body approaches the well-known two-dimensional case of the Karman vortex street. The simulated features of the wake collapse in a stratified fluid are obtained, and the three-dimensional wake structure is compared with the previously published experimental results. Dissert. Abstr.

CALCULATION AND MEASUREMENT OF THE TURBULENCE OF AN INCOMPRESSIBLE FLOW IN A LABYRINTH SEAL BETWEEN A ROTATING SHAFT AND A CYLINDER AT REST Ph.D. Thesis [CALCUL ET MESURE DE LA TURBULENCE D'UN ECOULEMENT INCOMPRESSIBLE DANS LE LABYRINTHE ENTRE UN ARBRE EN ROTATION ET UN CYLINDRE STATIONNAIRE]

Horst Stoff Zurich Juris-Verlag 1979 169 p refs In FRENCH; ENGLISH summary
(EPFL-ITA-8; ISBN-3-260-04775-1) Avail: Issuing Activity

Axisymmetric flow is computed with a pressure/velocity code in order to explain leakage phenomena against the mean pressure gradient. The main circumferential flow induces a secondary mean flow vortex pattern inside annular cavities on the surface of the shaft. One such cavity (in a model) is examined by comparing the finite difference result of a computer program with measurements obtained by a backscattering laser Doppler velocimeter. At a cavity Reynolds number of 30,000 and a Taylor number of 10,000 the boundary layers are 10% of the cavity width and the mean circumferential bulk velocity is 60% of the shaft rotation velocity. The probability density distribution of the circumferential velocity is gaussian outside the boundary layers with a degree of turbulence of < 5%. The energy spectrum shows the isotropic dissipation of the order of magnitude of the computation whereas the autocorrelation function indicates values smaller by one order of magnitude. The mean velocity field is well represented by the numerical computation. Author (ESA)

CALCULATION OF ANNULAR AND TWIN PARALLEL JETS USING VARIOUS DISCRETIZATION SCHEMES AND TURBULENCE MODEL VARIANTS

M. A. Leschziner and W. Rodi Feb. 1980 24 p refs
(KU-SFB-80/T/159) Avail: Issuing Activity

Numerical and experimental predictions are compared for (1) the hybrid upwind/central differencing scheme, (2) the hybrid skew-upwind/central differencing scheme, and (3) the quadratic, upstream-weighted differencing scheme. The turbulence models examined are the standard k-epsilon model and two variants. The first accounts for effects of stream-line curvature on turbulence and the second for the prefential influence of normal stresses on the dissipation of turbulence energy. Numerical scheme (1) particularly in conjunction with turbulence model modifications, results in severe solution errors and in a generally anomalous response to changes in the modelled viscosity field. In contrast, in all cases, schemes (2) and (3) yield, similar results and respond in an expected manner to the modifications. The modifications, particularly the one that accounts for streamline curvature, reduce, in some cases drastically, the discrepancies between computed and experimental data. Satisfactory results are obtained for both jets examined. Author (ESA)

A SECOND-ORDER ACCURATE PROCEDURE FOR SOLVING THE BOUNDARY LAYER EQUATIONS BASED ON THE PREDICTOR-CORRECTOR FORM OF THE CRANK-NICOLSON SCHEME

Kenichi Matsuno Jun. 1981 13 p refs
(NAL-TR-655T) Avail: NTIS HC A02/MF A01

The numerical accuracy of a predictor-corrector form of the Crank-Nicolson scheme for solving boundary layer equations is examined. The Crank-Nicolson Scheme, with a predictor-corrector step to deal with nonlinearity, exhibits only first-order accuracy unless the boundary layer continuity and momentum equations are solved in a coupled manner. A predictor-corrector form of the Crank-Nicolson scheme, based on a coupled solution for the continuity and momentum equations, is presented for both the incompressible and compressible flows. The present scheme was subjected to a computer experiment using the problem of the laminar boundary layer development in a linearly retarded edge velocity field. The results are compared with the Davis coupled scheme. It is shown that the present scheme posesses second-order accuracy and is more efficient than the Davis coupled scheme. R.J.F.

ON THE FLOW MEASUREMENTS AND VELOCITY VECTOR ANALYSIS USING FIVE-HOLE PITOT TUBES
Hideaki Nishimura 1981 29 p Partly in JAPANESE; partly in ENGLISH
(NAL-TR-668; ISSN-0389-4010) Avail: NTIS HC A03/MF A01

Five-hole pitot tubes are widely used to determine directions and magnitudes of velocities in three dimensional flow fields, because of their simplicity in handling and their reliability. A method of reducing data obtained from five-hole pitot tube measurements with the aid of a few sets of calibration daa is described. By using mini-computers, pitch and yaw angles and Mach numbers of flows can be computed simultaneously by this method with reasonable accuracy in the range of the pitot tube calibration. Author

(NASA-CR-165756; CALSPAN-6593-A-1) Avail: NTIS HC A04/MF A01 CSCL 20D

The fluid dynamic structure and stability of the boundary layer and shock layer ahead of a highly blowing heat shield in an environment simulating entry into the Jovian atmosphere were investigated. The experimental studies were conducted in the Calspan 96 in shock tunnel with a freestream of a H2/He mixture at Mach numbers above 10. Measurements of heat transfer and pressure were made on the porous model surface, and high-speed schlieren photography was used to examine the structure and stability of the shock layer. Results are presented which show how the heat transfer and shock layer stability vary for gases of different molecular weights for a range of Reynolds numbers and mass-addition rates. M.G.

A TITLE-GAP FLOW MODEL FOR USE IN AERODYNAMIC LOADS ASSESSMENT OF SPACE SHUTTLE THERMAL PROTECTION SYSTEM: PARALLEL GAP FACES
Douglas L. Dwoyer, Perry A. Newman, Frank C. Thames, and N. Duane Melson Oct. 1981 78 p refs
(NASA-TM-83151) Avail: NTIS HC A05/MF A01 CSCL 20D

The problem of predicting aerodynamic loads on the insulating tiles of the space shuttle thermal protection system (TPS) is discussed and seen to require a method for predicting pressure and mass flux in the gaps between tiles. A mathematical model of the tile-gap flow is developed, based upon a slow viscous (Stokes) flow analysis, and is verified against experimental data. The tile-gap pressure field is derived from a solution of the two-dimensional Laplace equation; the mass-flux vector is then calculated from the pressure gradient. The means for incorporating this model into a lumped-parameter network analogy for porous-media flow is given. The means for incorporating this model into a lumped-parameter network analogy for porous-media flow is given. The flow model shows tile-gap mass flux to be very sensitive to the gap width indicating a need for coupling the TPS flow and tile displacement calculation. Analytical and experimental work to improve TPS flow predictions and a possible shuttle TPS hardware modification are recommended. A.R.H.

HADY-I, A FORTRAN PROGRAM FOR THE COMPRESSIBLE STABILITY ANALYSIS OF THREE-DIMENSIONAL BOUNDARY LAYERS Final Report
Nabil M. El-Hady Washington NASA Sep. 1981 118 p refs
(Grant NsG-1645)
(NASA-CR-3467) Avail: NTIS HC A06/MF A01 CSCL 20D

A computer program HADY-I for calculating the linear incompressible or compressible stability characteristics of the laminar boundary layer on swept and tapered wings is described. The eigenvalue problem and its adjoint arising from the linearized disturbance equations with the appropriate boundary conditions are solved numerically using a combination of Newton-Raphson interative scheme and a variable step size integrator based on the Runge-Kutta-Fehlburh fifth-order formulas. The integrator is used in conjunction with a modified Gram-Schmidt orthonormalization procedure. The computer program HADY-I calculates the growth rates of crossflow or streamwise Tollmien-Schlichting instabilities. It also calculates the group velocities of these disturbances. It is restricted to parallel stability calculations, where the boundary layer (meanflow) is assumed to be parallel. The meanflow solution is an input to the program. M.G.

(AD-A105232; MDC-J2248) Avail: NTIS HC A03/MF A01 CSCL 20/4

In a previous report it was shown that a code based on the biharmonic formulation of the Navier-Stokes equations with the corresponding Newtonized difference equations solved by a direct band solver could be quite competitive in situations where considerably more grid points are used in one direction than in the other, such as flow in a long channel. The main advantages of this approach are that it is straightforward and robust. Both of these terms are subjective of course. To justify the first we may summarize the approach as follows: From derivative coefficients generated for the x and y variable grids we can immediately write down the difference equations and it is then a simple matter to write down the Newton equations. The coefficients are stored by diagonals as required by the band solver and the righthand sides computed, then the Newton corrections are obtained by calls to the band solver. Also the uniformity of the approach used for introducing the boundary conditions in section 4 simplifies the treatment of a wide variety of boundary conditions. GRA

ON THE MANIPULATION OF SPREADING RATES OF FORCED MIXING LAYERS Technical Report, 1 Jul. 1980 - 30 Jun. 1981
Chih-Ming Ho and Yu-Quan Zhang Sep. 1981 5 p refs
(Contract N00014-77-C-0314)
(AD-A105236) Avail: NTIS HC A02/MF A01 CSCL 20/4

The vortex merging in a mixing layer can be modified by applying periodic forcing at the origin. When the forcing parameters (frequency, amplitude as well as phase difference between fundamental and subharmonic) varies, the pattern of vortex merging changes. Consequently, the spreading rate of the mixing layer can be manipulated. The effect of each forcing parameter on the change in the spreading is discussed in the present paper. Author (GRA)

ADVECTIVE EFFECTS IN THE NUMERICAL SIMULATION OF LONG PERIOD, LARGE AMPLITUDE WAVE BEHAVIOR Final Report, Nov. 1977 - Sep. 1981
H. Lee Butler Sep. 1981 35 p refs
(AD-A105231; WES/MP/HL-81-4) Avail: NTIS HC A03/MF A01 CSCL 20/4

Numerical modeling of water-wave behavior has progressed rapidly in the last decade and is now generally recognized as a useful tool capable of providing solutions to many coastal problems. The U. S. Army, through various agencies, has sponsored development of two-dimensional numerical models for simulating long period wave behavior. Many of these models have included the advective terms in their formulation. Demonstrated in numerous papers throughout the literature, inclusion of advective effects can lead to instabilities in the solution. This fact was exemplified in the work of Sloss (1972) in his attempt to include these effects in storm surge simulation. The primary objective of this investigation was the assessment of the role of advective terms in the numerical simulation of long period, large amplitude wave behavior. A major effort in accomplishing this objective was the development of an appropriate representation of the non-linear terms in the difference equations of motion. To this end, a stabilizing correction, double sweep implicit scheme was encoded into an existing and extensively used hydrodynamic model, WIFM. The scheme manifested a high degree of stability in various numerical flume tests. GRA

AN INVESTIGATION OF F-16 NOZZLE-AFTERBODY FORCES AT TRANSONIC MACH NUMBERS WITH EMPHASIS ON MODEL SCALE EFFECTS Final Report, Oct. 1979 - Sep. 1980

Earl A. Price, Jr. Sep. 1981 149 p refs
(AD-A104905; AEDC-TR-80-57; AFWAL-TR-81-2110) Avail: NTIS HC A07/MF A01 CSCL 20/4

An experimental program was conducted to provide nozzle-afterbody data with a minimum interference support system on a 0.25-scale F-16 model and to determine the interference induced on then nozzle-afterbody region by sting and strut model support systems. Data obtained on the 0.25-scale model are compared with data from a 0.11-scale model for evaluation of model scale effects. The investigation was conducted over the Mach number range from 0.6 to 1.5. Data are presented in terms of coefficients and increments in coefficients of nozzle-afterbody axial and normal forces obtained from integrating pressure data. High-pressure air at ambient temperature was utilized for exhaust plume simulation. The results indicate close agreement in axial-force coefficient between configurations having full and annular nozzles at design pressure ratio. Very little effect of Reynolds number was found on the nozzle-afterbody axial force. Wave interference adversely affected axial-force data from the 0.25-scale model at Mach numbers between 1.0 and 1.1, producing lower axial force on the model afterbody. Large differences were determined in both the magnitude and the sign of strut interference from the two model installations. Author (GRA)

OBSERVATIONS OF THE EFFECTS OF BOUNDARY LAYER AND NUCLEI ON CAVITATION OF AXISYMMETRIC BODIES

J. A. Carroll 13 Feb. 1981 225 p refs
(Contract N00024-79-C-6043)
(AD-A104779; ARL/PSU-TM-81-60) Avail: NTIS HC A10/MF A01 CSCL 20/4

An investigation of limited cavitation was conducted on three different axisymmetric models. Test models included a hemispherical nose, a Schiebe nose, and a David Taylor Naval Ship Research and Development Center (DTNSRDC) nose. All models had a 2.0-in. diameter. Theoretical pressure distribution calculations and laminar boundary layer growth calculations were performed for the above models which were subsequently tested and also for a 1.5-caliber ogive nose, a 1.0-caliber ogive nose, and an International Towing Tank Conference (ITTC) nose to serve as supplementary information. The test models were chosen in accordance with their boundary layer flow characteristics. Laminar boundary layer separation was predicted to occur on the hemispherical nose for all test velocities. Calculations for the Schiebe nose indicated that laminar boundary layer separation does not occur and, therefore, this model exhibits an attached boundary layer for all velocities Laminar separation was predicted for the DTNSRDC nose; however, this model has a relatively low critical Reynolds number. As a result, the DTNSRDC nose exhibits laminar separation at low velocities and an attached boundary layer at high velocities. GRA

IN-DUCT VISCOUS FLOW PRESSURE DISTRIBUTION ON A BODY WITH BOUNDARY LAYER CONTROL

G. C. Lauchle 10 Aug. 1981 30 p refs
(Contract N00024-79-C-6043)
(AD-A105396; ARL/PSU-TM-81-165) Avail: NTIS HC A03/MF A01 CSCL 20/4

It is well known that the static pressure distribution of an axisymmetric body operating within the boundaries of a duct such as a wind or water tunnel test section is altered from that observed in a free stream because of solid blockage and horizontal buoyancy effects. Because potential flow solutions can account only for the solid blockage, auxiliary analysis must be performed to account for the viscous (horizontal buoyancy) effects. One such analysis has been performed by this author, where it was assumed that boundary layer development occurred in a natural, flat plate-like manner over the test body and duct walls. In this report, a modification of that analysis is presented which permits one to analyze bodies with boundary layer control. In addition to the theoretical formulation, a numerical example is presented to illustrate the effect on the pressure distribution of a 0.318 m diameter body with surface suction operating in a 1.22 m diameter duct. LAMINAR-FLOW-CYCLONE DEVELOPMENT PROGRAM Final Technical Report, 1 Nov. 1978 - 31 May 1981

W. B. Giles Jun. 1981 96 p refs
(Contract DE-AC21-78ET-11031)
(DE81-001297; DOE/ET-11031/T1; FE-3242-33) Avail: NTIS HC A05/MF A01

The feasibility of maintaining laminar flow in a cyclone separator was investigated. Various experimental models were used to simulate the essential flow requirements, and observations were conducted on the turbulent-laminar character of the flow. From this, it was concluded that laminar flow could be maintained up to relatively high Reynolds numbers in the radially-inward swirl flow regime. However, a large-scale instability occurs in turning to the axial swirlflow regime. All present attempts to suppress this instability failed, and the investigation was terminated. DOE

MEASUREMENT OF THERMAL CONDUCTIVITIES IN COAL FLUIDS

C. S. Chang, J. B. Bader, and J. L. Plawsky Sep. 1981 52 p refs
(Contract W-7405-eng-26)
(DE82-000523; ORNL/MIT-334) Avail: NTIS HC A04/MF A01

As a qualification of a transient hot wire, thermal conductivity cell for use on the Coal Liquids Flow System, the thermal conductivity of toluene was mesured between 25 and 850 C. Static measurements over a 4-sec time span yielded a thermal conductivity at 250 C of 0.12607 W/m-K and a slope of thermal conductivity vs temperature of -272.8 W/m-K (squared). All results are within 2 to 5% of the most recent literature data. An experimental error analysis showed all errors to be less than 1%. Dynamic-mode measurements in which flow through the cell was interrupted only for the measurement period agreed within experimental accuracy with the static-mode measurements, demonstrating that the hot-wire cell is immediately applicable to coal-slurry thermal-conductivity measurements in the Coal Liquids Flow System. Sedimentation experiments showed that settling should have a negligible effect on thermal-conductivity measurements over the time period envisioned for measurement. Excellent agreement was obtained between previous measurements of thermal conductivities of coal slurries and the predictions of the Rayleigh equation for heterogeneous-mixture thermal conductivities. RING EDDY FLOW METAMORPHOSIS AS A BASIS FOR IMPLOSION OF PARTIAL VACUUMS, SCHWENK'S DROP PICTURE METHOD AND CUTTING BY MEANS OF A WATER JET [DIE RINGWIRBELMETAMORPHOSE ALS GRUNDLAGE DER IMPLOSION VON KAVITATIONSBLASEN, DER SCHWENKSCHEN TROPFENBILDMETHODE UND DES WASSERSTRAHLSCHNEIDENS]

Peter E. M. Schneider Aug. 1980 66 p refs In GERMAN
(MPIS-13/1980; ISSN-0436-1199) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 23,55

The flow characteristics of ring eddies were experimentally investigated in order to explain materials erosion by cavitation. A literature review is presented and a ring eddy experiment is described. It was demonstrated that the implosion of partial vacuums (cavitation bubbles) occurs inside gaseous or fluid ring eddies passing over from laminar into turbulent flow resulting in a bubble jet capable of eroding solid materials. In the unstable vortex flow between colder gas core and warmer surrounding fluid an important temperature difference develops, heating the material and contributing to its erosion. The invarying degrees of periodicity, shaping and reshaping of secondary bubbles, helix and double-helix-like flows in the vortices probably contribute to cavitation noise. Author (ESA)

THE WINDOW AND ITS HEAT BALANCE CONSIDERING SOLAR RADIATION AND ADDITIONAL INSULATION MEASURES Final Report

Helmut Kuenzel and Christine Snatzke Bonn Bundesministerium fuer Forschung und Technologie Nov. 1980 27 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-80-070; B-HO-4/77; ISSN-0340-7608) Avail: NTIS HC A03/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 5,70

Tests were carried out with a common wooden framed window with clear-glass double glazing to determine the improvement of the transmission coefficient when shades, shutters, or curtains are used at night. During daytime remarkable gains of heat are obtained from solar radiation through windows. Taking into consideration day and nightime of the 12 day test period, more than 30 % of heating capacity is saved. The threshold value of solar radiation, for which gain of heat was equal to loss of heat, is found for the tested exterior wall surface at about 200W/sq m and for the clear glass double glazing at just 100W/sq m the difference of temperature between room air and outside air being 20k. The results can only be applied to conditions prevailing in the test rooms. However, based on these results, it can be stated that the heat balance of the window is favorably influenced by solar radiation especially through south windows, as well as by adequate insulation measures during the night (shades, curtains). PRACTICAL DEMONSTRATION OF HEAT PUMPS FOR UTILIZATION OF ANIMAL-GENERATED HEAT Final Report

Hans-Ulrich Amberg Bonn Bundesministerium fuer Forschung und Technologie Sep. 1980 47 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-80-100; ISSN-0340-7608) Avail: NTIS HC A03/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 10,30

Airconditioning of pigpens to eliminate effects of temperature extremes is reported. A stall air conditioner was installed as heat pump in a pigpen for final fattening. The heat, recovered from the exhaust air, is supplied to the outside air so that heated fresh air is blown into the stall. The test was accomplished on a farm with intensive pig breeding with 120 preliminary fattening places and 240 final fattening places. The stall air conditioner offers the possibility to attenuate the extreme temperature variations during the year. Author (ESA)

AIR CIRCUIT WITH HEATING PUMP Final Report

Herbert Holik, Hans Joachim Bauder, Hubert Brugger, Anton Reinhart, and Karl-Heinz Spott Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 56 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-80-188; ISSN-0340-7608) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 11,80

A pump which draws energy from exhaust air from a paper drying process to heat up the blow air was studied. The use of a heat pump instead of a steam heated exchanger can reduce primary energy consumption for blown air heating by more than half and the costs for air heating up to half. The amortization times for the heat pump extend from 5 to 10 years. Since in the pulp and paper industry, amortization times of less than two years are required for such relatively small investments, the heat pump so far is only used to heat blown air under highly favorable conditions. The rising energy prices shorten the heat pump amortization time. The 100% fuel price increase brought the heat pump with diesel engine drive already to very favorable amortization times of 2 to 5 years. A 20% increase will make the heat pump economically advantageous with an amortization time between 1 and 2 years. Author (ESA)

BASIC INVESTIGATIONS OF AN ABSORPTION HEAT PUMP, USING HEAT OF MEDIAN TEMPERATURE (HEAT TRANSFORMER) Final Report

Paul Franzen, Hans Herrmann, Chahpar Mostofizadeh, Horst Schinke, Dieter Seher, and Karl Stephan Bonn Bundesministerium fuer Forschung und Technologie Jan. 1981 305 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-81-013; ISSN-0340-7608) Avail: NTIS HC A14/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 46,90

It is noted that heat transformer circuits enable temperature rises without requiring any real high grade energy. The fundamental thermodynamics are described, and an outline of the present state of technology and of previous work in the field of heat transformer circuits is presented. In order to assess their suitability for the execution of this process, work media and plant concepts and components were looked at. Besides the thermodynamic construction of one and two stage plants, the applicability of the system was analyzed using laboratory equipment, and the application potential and productiveness of heat transformer circuits were estimated. From the results of these theoretical and experimental studies it is deduced what research and development work will be necessary for the further development of the system. Author (ESA)

LATERAL MIGRATION OF NEUTRALLY BUOYANT RIGID SPHERES IN SMALL DUCTS

Andreas Heertsch Nov. 1980 70 p refs In GERMAN; ENGLISH summary
(MPIS-20/1980; ISSN-0436-1199) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 13,65

Velocity profiles were measured with a laser Doppler velocimeter in microducts for rigid spheres suspended in water to study blood flow in capillary tubes. Assuming Hagen-Poiseuille flow, concentration distribution in terms of number density over wall distance are obtained. Distributions indicate that the particles assemble at a stable position at a quarter duct width from the wall. No further lateral particle migration away from this stable position is observed. Particles, entering the duct near its centers reach this stable position within a downstream distance, which is 5.7 times longer than the corresponding distance for particles entering the duct near the wall. It is found that these distances are proportional to the ratio duct width/particle size. Optical observations of particle traces are also discussed. Author (ESA)

TECHNICAL HEAT AND FLOW INVESTIGATIONS INTO HEAT EXCHANGERS MADE OUT OF SYNTHETIC MATERIALS, FOR USE IN DRY COOLING TOWERS Final Report

Helmut Polleck Bonn Bundesministerium fuer Forschung und Technologie Jan. 1981 43 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-81-004; ISSN-0340-7608) Avail: NTIS HC A03/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 8,70

Bare tube and flat heat exchangers (HE) made out of synthetic materials were investigated for use in dry cooling towers with natural draft. The advantages of synthetic materials are higher corrosion resistance, easier workability and lower cost. Suitability tests were performed designing the total system based on HE and tower construction. It is shown that bare tube bundles composed of tube walls or hollow plates separated by plastic strips with wall thicknesses less than 0.6 mm are an alternative to finned tube HE's of metal. Assuming specific building costs of 330 DM/sqm for the tower shell and HE manufacturing costs of 20 DM/kg, several solutions can be found with slight differences in heat transfer conditions and total costs between 22 and 25.10E6 DM. THE GRAVITY WAVE IN A LIQUID WITH A SURFACE FILM, IN THE PRESENCE OF AN APPLIED ELECTRIC FIELD

M. Dudeck and R. PrudHomme Jun. 1980 21 p refs
(Rept-80-2; Publ-620) Avail: NTIS HC A02/MF A01

The equation for the dispersion of a gravity wave is studied, using a simple electromagnetic model (no magnetic field, no polarization, electrical neutrality for the liquid and the gas). The surface is a medium possessing mass and inertia. The liquid behaves as a perfect fluid, allowing slippage of the film. A small amplitude disturbance was applied to the liquid. When the electric field is zero the two propagation modes are oscillatory and undamped (for n > one where n is a nondimensional parameter tied to the film's elasticity). The evolution is hence stable. For n < or equal to one, instability results. For a nonzero field and n > one, instability is determined by the parameters of the field in the reference state. For n < or equal to one the pattern of evolution is always unstable. Author (ESA)

DEVELOPMENT OF AN IMPROVED HIGH PERFORMANCE ARTERY HEAT PIPE Final Report

H. Kraehling Paris ESA May 1981 30 p
(Contract ESTEC-4050/79/NL-AK)
(ESA-CR(P)-1459) Avail: NTIS HC A03/MF A01

An existing space-qualified arterial high performance heat pipe was improved. Attempts to cut grooves with a self made single point threading tool were not successful. The grooves were not deep enough, so that a sufficient liquid supply over the entire circumference in the heating zone could not be obtained. Employment of commercially available thread taps showed an improvement in the groove depth but the groove profile itself was still poor. A further improvement of the profile shape was attained with a special set of threading tools consisting of an entering tap and a plug tap. Performance measurements with respective artery heat pipes confirmed that the heat pipe performance became better with the improvement of the circumferential groove profile. However, all investigated circumferential groove designs revealed a definitely poorer performance than the standard design with a screenwick as a secondary capillary structure. Author (ESA)

METHODS OF CALCULATING HEAT TRANSFER WITHIN THE PASSAGES OF HEAT EXCHANGERS

D. Brian Spalding Jul. 1981 13 p refs Presented at NATO Advanced Study Inst. Lectures, Ankara, 13-24 Jul. 1981
(HTS/81/4) Avail: NTIS HC A02/MF A01

Predictions of heat transfer and fluid flow processes within the passages of heat exchangers using: (1) experimental information generalized by dimensional analysis, (2) experimental information generalized by analogies between heat, mass and momentum transfer, (3) the methods of classical mathematics, and (4) numerical methods embodied in computer programs are considered. Practices (1) and (2) are becoming increasingly expensive while practice (3) remains of extremely limited utility. Practice (4) is increasing its power and reducing its costs as new computers, computer programs and experimental information become available. The principles of the numerical approach to within-passage heat transfer and fluid flow are described together with some of the difficulties of implementation and methods of overcoming them. Predictive capability, however, remains insufficient for designers, especially in respect of turbulence complicated by low Reynolds number and two phase phenomena. Author (ESA)

THE CALCULATION OF HEAT EXCHANGER PERFORMANCE

D. Brian Spalding Jul. 1981 16 p refs Presented at NATO Advanced Study Inst., Ankara, 13-24 Jul. 1981
(HTS/81/5) Avail: NTIS HC A02/MF A01

The general principles of the numerical approach to computation of heat exchanger performance are outlined. Attention is given to several specific topics: (1) how partial elimination can accelerate convergence; (2) a solving scheme for linear equations; (3) the ways in which the velocity components for interpenetrating continua can be defined; and (4) how resistances to flow, such as baffles and tube support plates, are allowed for. The advantages of the method are that transient phenomena can be predicted as well as the steady state; temperature dependent and otherwise nonuniform transfer coefficient data can be handled; unusual flow patterns can, if known, be allowed for; unknown flow patterns, and their influence on the heat transfer performance, can be computed; reciprocal interactions of the temperature and velocity fields, such as those resulting from buoyancy effects, can be correctly taken into account; and two and three dimensional variations of temperature and other flow variables can be allowed for. NUMERICAL COMPUTATION OF TWO PHASE FLOW IN GUN BARRELS

D. Brian Spalding Jun. 1981 17 p refs Presented at US Army Workshop on Multi-Phase Flow, Aberdeen, Maryland, 2-4 Feb. 1981
(HTS/81/6) Avail: NTIS HC A02/MF A01

There are three or four imdependent variables and seventeen or more independent ones involved in the computer simulation of gun-barrel phenomena which is recognized as transient compressible, two-phase flow in a moving cordinate system. Two cmputer programs for predicting the distributions of velocities, pressures, and temperatures are reviewed. The major obstacle to making realistic predictions is ignorance of the precise laws governing interphase transport, turbulent mixing, particle-particle and particle-wall impacts, and chemical kinetics. It is argued that numerical modeling conducted at the particle-scale level, can be helpful. Numerical computations on grids of subparticle size confirm friction, heat transfer, and mass transfer laws. Hypotheses are needed for turbulence and particle impact.

SELF-INDUCED PULSATING LIQUID FLOW IN A HYDRAULIC SYSTEM

Gerd E. A. Meier and Andrzej P. Szumowski Dec. 1980 49 p refs
(MPIS-15/1980; ISSN-0436-1199) Avail: NTIS HC A03/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 10,35

Pulsating liquid flow of large amplitude in a system containing a tank, a tube and a valve which has an elastically supported plate is investigated. The functions of the flow properties versus some nondimensional parameters were found. These parameters depend on supply pressure, inertia of the liquid and of the valve as well as on the elasticity of the plate support and the dimensions of the system. The occurrence of cavitation zones in the liquid flow is taken into account. Theoretical and experimental results are compared. Both show that the amplitude of the pressure can exceed supplied pressure. Author (ESA)

PROPAGATION ON FINITE DISTURBANCES IN THE BOUNDARY LAYER

Geert Zimmermann Mar. 1981 40 p refs
(MPIS-3/1981; ISSN-0436-1199) Avail: NTIS HC A03/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 9

Amplitude disturbances at large Reynolds numbers are considered. They are assumed to be wave like. A two scale expansion leads, in the lowest order of the Reynolds number, to a nonlinear eigenvalue problem for the local wave shapes and an integral condition for the long range development of these waves. Local conditions are engendered by evaluation of this integral condition. These help solve the eigenvalue problem. Waves over longer propagation ranges are shown to be asymptotic by the results of the evaluation of the propagation equation in the vicinity of the critical stream line. Author (ESA)

A SOLUTION OF THE NAVIER-STOKES EQUATIONS BY A MIXED FINITE ELEMENT METHOD Thesis

Marc Bredif Sep. 1981 109 p refs Transl. into ENGLISH of "Resolution des Equations de Navier-Stokes par une Methode d'Elements Finis Mixtes", ONERA, Paris Report ONERA-NT-1981-1, 1981 Original report in FRENCH
(ESA-TT-720; ONERA-NT-1981-1) Avail: NTIS HC A06/MF A01

The numerical treatment of steady state, two-dimensional Navier-Stokes equations in the incompressible case is studied. The approximation method retained is the mixed finite element method, as regards stream function and vortex function. The improvements to this formulation are: possibility of choice of boundary conditions of various types; introduction of a finite element formulation of the stagnation pressure calculation; definition of a corrected formulation with a view to studying laminar flows in the case of large Reynolds numbers. The chosen formulation is discussed theoretically, encompassing the aspects mentioned. A solution algorithm is presented, based on a general conjugate gradient method; numerical results are presented for various cases of viscous, incompressible, laminar flows: (1) in a square cavity; (2) around a circular cylinder; and (3) around a NACA 0018 profile at zero angle of attack for Reynolds numbers up to 5000. STATISTICAL AVERAGING IN POSITION DETERMINATION BY HOLOGRAPHY UNDER TURBULENCE CONDITIONS Ph.D. Thesis
Paul Aloysius McGovern 1981 153 p
Avail: Univ. Microfilms Order No. 8121969

An investigation of several, disparate phenomena was conducted with the aim of developing a surveying system capable of overcoming the limitations imposed by turbulence in modern surveying. This method incorporates standard holographic techniques and time domain statistical averaging of survey data. Some pertinent characteristics of atmospheric turbulence were reviewed, and the restrictions imposed on standard surveying practices by such turbulence are identified. A model for the turbulent medium is proposed and several theoretical results summarized and extended. Dissert. Abstr.

DEVELOPMENT AND APPLICATIONS OF COMPUTER-ASSISTED ACOUSTIC HOLOGRAPHY Ph.D. Thesis
Carl Frederick Schueler 1980 160 p
Avail: Univ. Microfilms Order No. 8120752

Holographic underwater imaging with coherent acoustic radiation and a digital computer is described. The development of hardware and software to produce and digitally reconstruct acoustic holograms is discussed. Among several digital techniques to reconstruct acoustic holograms is one known as backward-propagation. This method is described in a way so that its peculiar characteristics can be explained with reference to aliasing and replication of discrete Fourier transforms. One and two-dimensional images are presented. Using the concept of point-image size, the resolution of the coherent experimental system used to obtain these results is found to be about 1.5 times the diffraction-limited resolution value. Furthermore, the diffraction-limited system resolution matches the Rayleigh resolution criterion that is usually used to evaluate incoherent imaging systems. Dissert. Abstr.

A RADIONUCLIDE COUNTING TECHNIQUE FOR MEASURING WIND VELOCITY
Jag J. Singh, G. S. Khandelwal (Old Dominion Univ.), and Gerald H. Mall (Computer Sciences Corp., Hampton, Va.) Dec. 1981 25 p refs
(NASA-TM-83202; L-14792) Avail: NTIS HC A02/MF A01 CSCL 14B

A technique for measuring wind velocities of meteorological interest is described. It is based on inverse-square-law variation of the counting rates as the radioactive source-to-counter distance is changed by wind drag on the source ball. Results of a feasibility study using a weak bismuth 207 radiation source and three Geiger-Muller radiation counters are reported. The use of the technique is not restricted to Martian or Mars-like environments. A description of the apparatus, typical results, and frequency response characteristics are included. A discussion of a double-pendulum arrangement is presented. Measurements reported herein indicate that the proposed technique may be suitable for measuring wind speeds up to 100 m/sec, which are either steady or whose rates of fluctuation are less than 1 kHz. (DE81-031923; DOE/CS-12077/T1) Avail: NTIS HC A14/MF A01

The commercial potential of a helical recuperator design in recovering waste heat from industrial furnaces is reported. The helical recuperator concept consists of a cylindrical column with an interior helical interface which separates the preheat air and the combustion gas. The column operates in a tear flow mode and is formed from modular sections. The material evaluation consisted of exposing material samples to a soda-lime glass furnace environment for a fifteen week period. ECP-3, X-81, and Unichrome were the best suited for use in a soda-lime environment and ECP-3 was the best candidate with respect to manufacturing. Two potential design modifications were identified: a finned design and a double helix design. For materials that showed the greatest potential for use in the glass environment, the double helix design made from ECP-3 was the most economical producing payback periods of 6 to 14 years. DOE

A compact humidity sensor with a capacitive sensor element and processing electronics, for measuring the relative humidity of air, was developed. By a systematic selection of materials for dielectrics and electrodes, signals with linear dependence on moisture and only small changes with temperature were obtained. The electronic circuits are based on pulse length modulation and are designed for digital display. Two alternatives were developed. The circuits with bipolar IC's were specially laid out with 20 mA output, while the CMOS circuits were designed to save energy. In both cases the output signals are evaluated by microcomputers. A specially formed case provides mechanical protection for the sensor element and moistureproof encapsulation of the circuits. The modules were developed for one fabrication stage and were given to consumers for testing. Author (ESA)

(TPD-1980-0-3; TDCK-75067) Avail: NTIS HC A03/MF A01

Impact phenomena of airgun projectiles on ceramic targets are discussed. The difference between the deformation velocities observed in different experiments is studied. While measured values of about 1.6 m/sec are cited, under similar experimental conditions velocities one or two orders of magnitude greater are also found. A model is developed which describes the spatial extension of the double exposure interference pattern as a function of the parameters deformation velocity, radial velocity of the deformation wave, pulse duration, whole body motion and time. Nonlinear relations for the deformation velocity, and the radial velocity, as a function of time are considered in order to bring the computed results into better agreement with the observed phenomena. As the interference patterns observed appear to be very finely detailed, an alternative holographic setup is described, yielding holograms that can be microscopically evaluated. Author (ESA)

INTENSE PROTON BEAM EXCITATION OF A HIGH PRESSURE ARGON-NITROGEN LASER Ph.D. Thesis
Larry Glenn Wiley 1981 321 p
Avail: Univ. Microfilms Order No. 8119479

An intense proton-beam diode source was developed and beam transport was studied. The magnetically insulated diode produced a uniform planar proton beam having a half-angle divergence less than 4 deg. Beam transport studies included vacuum propagation with and without magnetic focusing fields. Also, spatial bunching of the proton beam during propagation was obtained by using a variable impedance pulse forming line to produce a rapidly rising accelerating voltage pulse. The 0.5 MeV proton beam extracted from the diode source was injected into a high pressure laser cavity through a 2 micron thick mylar foil window. The protons deposited about 0.18 MeV of their energy in the foil and the remainder within a short range (0.15 to 1.2 cm) in the 300-3040 Torr Ar/N2 gas mixture. Ionization and excitation of the gases by the proton beam led to selective excitation of the upper laser level and to subsequent laser action at wavelength of 337.1, 357.7, and 380.5 nm corresponding to electronic transitions to the lower laser levels, respectively. Results from the experimental study of the laser energy, power, and spectral emission were compared to the predictions of a zero dimensional, uniform-gain model of the laser which was solved numerically. EXCESS NOISE IN TUNABLE DIODE LASERS
Carroll W. Rowland Nov. 1981 16 p refs
(NASA-TP-1935; L-14453) Avail: NTIS HC A02/MF A01

CSCL 20E

The method and the apparatus for identifying excess-noise regions in tunable diode lasers are described. These diode lasers exhibit regions of excess noise as their wavelength is tuned. If a tunable diode laser is to be used as a local oscillator in a superheterodyne optical receiver, these excess-noise regions severely degrade the performance of the receiver. Measurement results for several tunable diode lasers are given. These results indicate that excess noise is not necessarily associated with a particular wavelength, and that it is possible to select temperature and injection current such that the most ideal performance is achieved. A NEW POWER METER CONCEPT FOR HIGH ENERGY LASERS Interim Report
P. B. Ulrich, G. L. Trusty, and D. H. Leslie 24 Sep. 1981 15 p refs
(AD-A104824; NRL-MR-4429) Avail: NTIS HC A02/MF A01 CSCL 20/5

We describe a new concept for measurement of High Energy Laser (HEL) power. The technique is based upon the phenomenon of optoacoustic detection, which is a sensitive measurement of the sound waves created by absorption of a laser beam of known power with a sample of absorber material for the purpose of absorption coefficient determination. We propose that this process can be inverted to produce an absolute measurement of laser power by using a material for which the absorption coefficient at the laser frequency is sufficiently well known. We present a conceptual design and we suggest studies for future development of the concept. Author (GRA)

THE RAYLEIGH-TAYLOR AND KELVIN-HELMHOLTZ INSTABILITIES IN TARGETS ACCELERATED BY LASER ABLATION Interim Report
M. H. Emery, J. H. Gardner, and J. P. Boris 25 Sep. 1981 20 p refs
(AD-A104804; NRL-MR-4626) Avail: NTIS HC A02/MF A01 CSCL 20/5

Using the FAST2D laser-shell simulation model we have accelerated a 20 micrometer thick plastic foil up to 160 km/s. The foil maintained its integrity up to 10 ns giving an aspect ratio of 40. We are able to follow the Rayleigh-Taylor bubble-and-spike development far into the nonlinear regime and beyond the point of foil fragmentation. Strong shear flow develops at the interface between the bubble-and-spike which leads to the development of the Kelvin-Helmholtz instability. The K-H instability causes the tips of the spikes to widen and as a result reduce their rate of 'fall'. Author (GRA)

COHERENT AND INCOHERENT RADIATION FROM FREE ELECTRON LASERS WITH AN AXIAL GUIDE FIELD Interim Report
H. P. Freund, P. Sprangle, D. Dillenburg, E. H. daJornada, B. Liberman, and R. S. Schneider 8 Oct. 1981 54 p refs
(WF32389592)
(AD-A104806; NRL-MR-4643) Avail: NTIS HC A04/MF A01 CSCL 20/5

The spontaneous and induced emission from a free electron laser is treated for the case in which an axial magnetic field is imposed in addition to the helical, axially periodic wiggler magnetic field. The classes of possible single-particle trajectories in this configuration are discussed, and the results are applied to a calculation of the incoherent radiation from a beam of relativistic electrons in the system. The coherent radiation is treated by solving the Vlasov-Maxwell equations for the linear gain in the tenuous beam limit, where the beam plasma frequency is much less than the radiation frequency and self-field effects can be ignored. We demonstrated the first cw phase-conjugating mirror with gain, and made a self-oscillating resonator which emitted a diffraction-limited optical beam while severe phase aberration was present in the resonator. We demonstrated storable and erasable phase-conjugate images in the nanosecond regime by a one-photon photorefractive process. We achieved the first demonstration of a wide angle (approx. 45 deg.) narrowband (approx. 1/10 cm) optical filter using phase conjugation. We achieved the first demonstration of full vector-wave phase-conjugation by which an image was restored after double-passing a birefringent phase aberrator. We demonstrated edge-enhancement of an optical phase-conjugate image in real time. Studies of resonant nonlinear refraction and phase conjugation in sodium vapor continued. Author (GRA)

SCALING LAWS FOR PULSED CHAIN-REACTION CHEMICAL LASERS
Harold Mirels, Robert Hofland, Jr., and James S. Whittier 7 Aug. 1981 42 p refs
(Contract F04701-80-C-0081)
(AD-A104752; TR-0081(6725)-1; SD-TR-81-57) Avail: NTIS HC A03/MF A01 CSCL 20/5

Scaling laws for pulsed chain-reaction chemical lasers are deduced with the use of a two-level vibrational model. The performance of a saturated laser depends only on the parameter K = t sub cd/t sub p, where t sub cd and t sub p are the characteristic collisional deactivation and characteristic pumping times, respectively. The normalized output energy per unit volume per pulse of a saturated HF chain-reaction laser is 2E/Epsilon H sub 2,0 = K(1 + O(K)), where E is output energy per unit volume per pulse, Epsilon is energy per mole of photons, and H sub 2, 0 is the initial concentration of H sub 2 in moles per unit volume. In the range 0.02 < or = thi << 1 the normalized output energy from a saturated HF laser can be expressed as 2E/Epsilon H sub 2, 0 = thi, where thi approx. = (F/F sub 2) sub 0 1/2(F sub 2/H sub 2)0(1 + 0.094(F sub 2/H sub 2) sub 0) to the minus 1/2 power. In the latter regime the product Et sub e is a constant for a saturated laser (t sub e = pulse length). Corrections for multiple vibrational levels are given in an Appendix. Author (GRA)

CONSTRUCTION AND CHARACTERISTICS OF AN OPTICALLY PUMPED FIR-LMR SPECTROMETER [AUFBAU UND EIGENSCHAFTEN EINES OPTISCH GEPUMPTEN FIR-LMR-SPEKTROMETERS]
A. W. Preuss, F. Temps, and H. G. Wagner Sep. 1980 63 p refs In GERMAN
(MPIS-18/1980; ISSN-0436-1199) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 12.45

The principle of the spectrometers, the CO2 and FIR lasers are described in detail. The FIR laser operates at more than 50 lines in the wavelength region from 70 to 743 microns and has an output power of about 0.2 mW. Spectrometer absorption

signals are directly proportional to the concentration of radicals. Due to the large number of detectable particles and its sensitivity, this apparatus enables the direct measurement of the concentration of reagents and reaction products for the determination of the time constants of the reactions of free radicals.

FRICTION AND WEAR BEHAVIOR OF Ti-6Al-4V AND A Ni BASE ALLOY (HASTELLOY C-276) Ph.D. Thesis
Nam-Soo Kim 1981 181 p
Avail: Univ. Microfilms Order No. 8120989

Some variables for wear and friction were investigated riding Ti-6Al-4V and Hastelloy C-276 with a low carbon steel as a mating material. A ring on ring type of specimen contact rather than a pin on disk type was used. The effect of specimen geometry was investigated when two kinds of specimen contact were arranged. Material properties and specimen geometry were variables for the titanium alloy and steel couple. The specimens of Ti-6Al-4V were heat-treated in different ways. It was found that specimen geometry is an important factor for friction and wear behavior specially when the difference in hardness between two contacting materials is large. Variables of load, speed, and specimen geometry were investigated for the Hastelloy and steel couple. Wear amount increases with increasing load and sliding speed. The average coefficient of friction significantly decreases with increasing the applied load. Dissert. Abstr.

THE EFFECT OF A TRANSLATING HIGH ASPECT RATIO PARTICLE IN A PLANE SLIDER BEARING Ph.D. Thesis
Michael Thomas Languirand 1981 127 p
Avail: Univ. Microfilms Order No. 8121153

An approximate solution of Stokes equations to determine the pressure and velocity fields in an infinite slider bearing containing a two dimensional high aspect ratio particle of arbitrary cross sectional shape is presented. The fluid field is divided into four regions; upstream, above, below and downstream of the particle. The Stokes equations are applied to each region and solved through specific continuity requirements and pressure matching conditions. Approximate solutions are given for the pressure and velocity fields. A pressure drop which develops in the pressure field at the particle location is noted. The magnitude of this drop is dependent on particle size, velocity and location. The particle has a major effect on the bearing pressure field when it is able to significantly obstruct the flow of the lubricant. The transient pressure in a slider bearing as a high aspect ratio two dimensional rectangular particle is passed through the fluid film. The apparatus measures pressure at a particular location in the bearing and simultaneously measures the particle's displacement with respect to its initial starting location. The effect of particle velocity on the pressure field in the bearing is demonstrated. Dissert. Abstr.

MODIFIED FACE SEAL FOR POSITIVE FILM STIFFNESS Patent
Izhak Etsion (Technion - Israel Inst. of Tech.) and Abraham Lipshitz, inventors (to NASA) (Technion - Israel Inst. of Tech.) Issued 29 Sep. 1981 4 p Filed 7 Nov. 1979 Supersedes N80-12414 (18 - 03, p 0334) Sponsored by NASA
(NASA-Case-LEW-12989-1; US-Patent-4,291,887;
US-Patent-Appl-SN-092145; US-Patent-Class-277-27;
US-Patent-Class-277-40; US-Patent-Class-277-93R) Avail: US Patent and Trademark Office CSCL 11A

The film stiffness of a face seal is improved without increasing the sealing and dam area by using an apparatus which includes a primary seal ring in the form of a nose piece. A spring forces a sealing surface on the seal ring into sealing contact with a seat to form a face seal. A circumferential clearance seal is formed in series with this face seal by a lip on the piece. The width of the surface of the lip is subsntially the same as the width of the sealing surface on the face seal and the clearance between the surface on the lip and the shaft is substantially the same as the spacing between the face sealing surfaces on the face seal when the shaft is rotating. The circumferential clearance seal restricts the flow of fluid from a main cavity to an intermediate cavity with a resulting pressure drop. The hydrostatic opening face is strongly dependent on the face seal clearance, and the desired axial stiffness is achieved.

STUDY AND DEVELOPMENT OF FACE-CONTACT, BELLOWS MECHANICAL SEAL FOR LIQUID HYDROGEN TURBOPUMP
Masataka Nosaka, Mineo Suzuki, Yukio Miyakawa, Kenjiro Kamijo, Masataka Kikuchi, and Masahiro Mori 1981 38 p refs In JAPANESE; ENGLISH summary
(NAL-TR-653; ISSN-0389-4010) Avail: NTIS HC A03/MF A01

A face contact, bellows mechanical seal for a liquid hydrogen turbopump (seal diameter: 43.2 mm) is developed. The developed mechanical seal has a seal nosepiece, which reduces the sealing face distortion at low temperature and high pressure, and results in a small amount of seal leakage and wear and a low starting torque. A vibration damper made of Teflon sheets is fixed in the nosepiece in order to prevent it from fluttering during the rapid start or stop of a turbopump. The turbopump mechanical seal satisfied almost all requirements for application to a turbopump: seal leakage, wear life, reliability and starting torque. S.L.

Development of a gas turbine powertrain with a 30% fuel economy improvement over a comparable S1 reciprocating engine, operation within 0.41 HC, 3.4 CO, and 0.40 NOx grams per mile emissions levels, and ability to use a variety of alternate fuels is summarized. The powertrain concept consists of a single-shaft engine with a ceramic inner shell for containment of hot gasses and support of twin regenerators. It uses a fixed-geometry, lean, premixed, prevaporized combustor, and a ceramic radial turbine rotor supported by an air-lubricated journal bearing. The engine is coupled to the vehicle through a widerange continuously variable transmission, which utilizes gearing and a variable-ratio metal compression belt. A response assist flywheel is used to achieve acceptable levels of engine response. The package offers a 100 lb weight advantage in a Chrysler K Car front-wheel-drive installation. Initial layout studies, preliminary transient thermal analysis, ceramic inner housing structural analysis, and detailed performance analysis were carried out for the basic engine. S.L.

CUTTING TOOL COATINGS PROGRAM Final Report
Nov. 1980 47 p
(Contract DE-AC03-80CS-40446)
(DE81-026289; DOE/CS-40446/T1) Avail: NTIS
HC A03/MF A01

This project was designed to validate the energy saving potential of hard refractory coatings on cutting tools. One-quarter-inch jobber drills were selected to be coated with the hard refractory compounds of TiC and TiN by the Activated Reactive Evaporation (ARE) process. The TiN-coated drills performed best with tool lives from 2 to 4 times those of the black oxide coated drills, and up to 20 times those of bright drills. This improvement in tool life can be correlated to energy savings as expressed by the criteria of Btu/lb of material removed. Limited direct force measurements were also taken and indicated a reduction in cutting forces of TiN-coated drills over black-oxide-coated drills. A commercial ARE coating system was concieved and analyzed; it was found to be a potentially economica solution to coating a large variety of tools. If coated tools from such a system were fully used in industry, an estimated energy savings of 10 to the 13th power 10 to the 14th power Btu/y could be achieved. This report describes the cutting tool program background work, the project tasks, and the results of the project. DOE

HC A07/MF A01

Thermo-mechanical considerations and material selection criteria for the design of steam turbine blades are discussed from the mechanical engineer's point of view. Sources of vibratory excitation, responses to excitations, stress levels, resultant load histories, and various design features incorporated to minimize or resist stresses are covered. Blading alloy properties are discussed and compared, and parameters for fatigue testing are recommended. Several blade failure surveys are described. Results of a questionnaire on LP blade failures to American utilities and a review of recent Westinghouse experience are presented. Correlations between the number of failures and parameters such as blade life, failure locations, alloy, deposit chemistry, steam source, feedwater treatment, cooling water source, balance of plant problems, and temperature and pressure at the failed row are attempted. HC A10/MF A01

The advantages of advanced fabrication techniques for convectively cooled airfoils for utility combustion turbines were discussed with emphasis on airfoils fabricated from thin sheets of metal (water airfoil). It is demonstrated that low metal temperatures could be achieved, corrosion, erosion and deposition problems could be relieved, and economic benefits realized.

Results show that wafer airfoils could be fabricated in utility combustion turbine sizes. Low metal temperatures were achieved in a conceptual design, but experimental verification was not obtained. Tests to show that corrosion, erosion, and deposition problems were relieved. There are economic benefits for wafer airfoils relative to conventionally cast airfoils. Benefits are not large relative to benefits achievable by another fabrication technique, the bonded airfoil, which has a higher degree of development and manufacturing capability. DOE

THE RELATION BETWEEN WELDING PARAMETERS FOR A BEAM SECTION AND ITS BUCKLING RESISTANCE [RELATION ENTRE LES PARAMETRES DE SOUDAGE D'UNE COLONNE ET SA CHARGE DE FLAMBEMENT]

A. Plumier Apr. 1981 43 p refs In FRENCH; ENGLISH summary Sponsored by Inst. pour l'Encouragement de la Recherche Scientifique dans l'Industrie et l'Agriculture

(CRIF-MT-143) Avail: NTIS HC A03/MF A01

Standardized curves for the calculation of buckling strength are called into question. These curves pertain to different structural members, such as beams and plates. It is demonstrated that for certain fabrication conditions, i.e., manual welding, particularly of I beams, these dimensioning curves give unreliable specifications. The analytical determination of the residual stress distribution in a welded I beam is considered. The evolution of the stress field in a plate being welded is described. Both thin and thick welded plates are dealt with. The method is applied to arrive at parametrical results for the buckling strength of welded sections, allowing the real safety factor to be determined for the defined distribution of welding parameters and cross sections. Complete relations for the calculation of residual stress in various structural profiles are shown. Author (ESA)

COMPRESSION STRESS RELAXATION TESTING FOR DETERMINING THE PERFORMANCE OF ELASTOMERIC FLUID SHELLS

M. W. Aston, K. P. Palmer, and J. Bayley 1981 17 p refs

Avail: NTIS HC A02/MF A01

The compression stress relaxation properties of fluorocarbon and fluorosilicone 'O' rings are correlated to their sealing performance and related to other properties which are commonly used for assessing this performance. Correlation with sealing performance is good. Poor correlation is obtained with volume swell, compression set, low temperature brittle point and the Gehman T10 value. These properties could give a misleading indication of the likely sealing performance of the elastomer. Compression stress relaxation is the property which most closely conforms to the configuration in which most elastomeric seals are used and is the best property for indicating their likely sealing performance, particularly as it can be measured over the full range of environmental conditions that might be applied to the seal. FACING ON STAMPING DIES Final Report [REVETEMENT DES GRAVURES D'ESTAMPAGE]
Batit 15 Dec. 1980 21 p refs In FRENCH
(CETIM-1.3K.26.2) Avail: NTIS HC A02/MF A01

Three surface treatments, commercially available to improve the wear resistance of stamping die matrices, were tested and compared. The surface coatings were applied by the companies marketing the techniques. Testing was carried out in the laboratory under semi-industrial conditions. Results show that: (1) the Rocklin coating, which consists of tungsten carbides and/or titanium carbides, has the same wear characteristics as the unsurfaced test die; (2) electrodeposition of cobalt alloys (still process) improves wear resistance; and (3) boride coating on stamping tool steel is of little benefit since there is not enough difference in fracture strength between the unsurfaced die face and the coating. BIBLIOGRAPHICAL STUDY OF NONDESTRUCTIVE TESTING APPLICABLE TO BONDING [ETUDE BIBLIOGRAPHIQUE DES MOYENS DE CONTROLE NON DESTRUCTIF ENVISAGEABLES POUR LES COLLAGES]
Benezet Oct. 1980 37 p refs In FRENCH
(CETIM-1.3N.20.2-Pt-1) Avail: NTIS HC A03/MF A01

The nondestructive characterization of surfaces to be bonded as well as tests which reveal the spreading behavior of glues after bonding are reviewed. No test which can unequivocably determine the suitability of a surface for bonding is found. However, for a given process, i.e., aluminum bonding, measurement of the difference in surface contact potentials gives good results. Among methods for testing the even spreading of glue between bonded surfaces, only ultrasonic techniques are at present economically feasible on an industrial level. Author (ESA)

The displacements of cross sections of columns in a multistorey building were determined with the use of one dimensional elastic waves taking into account reflections. Formulas were developed for accelerations of the building foundation and for equivalent damping of the viscous type. Analytical solutions were obtained in the form of recurrence formulas for the functions, by means of which displacements of the cross sections of the building columns can be determined at any moment of time. The physical model of a multistorey building is examined. A.R.H.

THE PROBLEM OF AXIALLY SYMMETRIC FLOW OF IDEAL RIGID-PLASTIC HUBER-MISES MEDIUM WITHOUT ANY SPECIFIC HYPOTHESES
Marian Rogozinski 1981 21 p refs
(ISSN-0208-5658) Copyright. Avail: Issuing Activity

The general system of seven equations in the problem is reduced to two by means of, among other things, the introduction of two unknowns: alpha and beta. The necessary boundary values for posing the boundary problem in the case of a hyperbolic system are determined. The integrodifferential equation system is reduced to a hyperbolic system in the whole region under consideration by means of a suitable transformaton of alpha, beta, into bar alpha, beta. The method of characteristics is used. In the case of ellipticity, (the main alternative of the hyperbolicity, there is no uniqueness of solution, and some instability would occur because of the unbounded domain. A.R.H.

THE RESPONSE AND THE LIFT FORCE ANALYSIS OF A CYLINDER OSCILLATING IN STILL WATER Ph.D. Thesis
Youn-sik Park 1981 131 p
Avail: Univ. Microfilms Order No. 8122553

An elastically mounted cylinder exposed to a periodic fluid flow field is studied. The prediction of fluid lift forces and cylinder responses normal to the deterministic, sinusoidal oscillating flow is emphasized. A cylinder model was driven sinusoidally in still fluid in order to give a relative sinusoidal motion between the fluid and cylinder. A simple experimental apparatus and a strict control of the input variables such as cylinder driving amplitude and frequency were selected. The corresponding fluid lift forces and the cylinder response amplitude were measured for two different size cylinder models for various cylinder driving frequencies and amplitudes. It was found that the fluid lift forces and the cylinder response amplitudes for an elastically mounted cylinder can be explained and predicted using frequency ratios rather than Reynolds and the Keulegan-Carpenter numbers. The measured fluid lift forces were found to be far greater than those corresponding to a stationary cylinder exposed to an oscillating flow field. Dissert. Abstr.

EMISSION SPECTRA FROM EHD CONTACTS Ph.D. Thesis
Vincent Wen-Shiuan King 1981 134 p
Avail: Univ. Microfilms Order No. 8121150

A ball/plate sliding elastohydrodynamic contact was constructed by placing a diamond window at the bottom of a cup containing test fluid and rotating a loaded bearing ball over it about a horizontal axis. The infrared radiation generated by viscous friction in the lubricant film is transmitted through the window, collected by an all-mirror microscope objective, and analyzed by a Michelson interferometer. It is thus possible not only to determine lubricant and bearing ball surface temperatures but the infrared spectrum of the lubricants as well. The radiation emitted in the contact region is very weak, but the high sensitivity of the interferometer (Fourier spectrometer) is more than adequate to analyze it. The equivalence between infrared emission and absorption spectsa was established. Dissert. Abstr.

VIBRATION OF CYLINDRICAL SHELLS AND PANELS OF OVAL CROSS-SECTION Ph.D. Thesis
Vlasios K. Koumousis 1980 285 p
Avail: Univ. Microfilms Order No. 8118881

The dynamic characteristics of simply supported and infinitely long cylindrical shells of oval cross section are established on the basis of Flugge type, thin shell theory. A method obtaining the dynamic characteristics of cylindrical panels of non circular cross section with simply supported, curved edges and any boundary conditions along their straight edges is presented. Numerical results are presented and the effect of the ovality as well as other geometric parameters of the shell are investigated, and the range of validity of the Donnell and Love type theories is established. The general solution of this system of eight equations is written as a linear combination of a set of eight independent solutions involving eight constants. Numerical results are obtained on the basis of the Flugge and Donnel type theories for oval panels with different ovality, length, thickness ratio and opening angles of 180 and 120. The influence of the geometric parameters and a comparison of the different theories were studied. Dissert. Abstr.

WAVE INDUCED VIBRATIONS OF CONTINUOUS FLOATING STRUCTURES Ph.D. Thesis
Constantinos Georgiadis 1981 118 p
Avail: Univ. Microfilms Order No. 8121197

The response of continuous floating structures was studied. Hydrodynamic forces on a continuous floating structure are examined and boundary element methods were used for the numerical solution. Response of a continuous floating structure to long crested, oblique waves are investigted. Fourier transformation techniques and finite element modeling were applied. Errors of a rational finite element model are pointed out. Response of a continuous floating structure to short crested waves the sea is modelled as a random process with a directional energy spectrum. Monte-Carlo and linear filtering methods are used to obtain nodal loads satisfying appropriate space correlation of the waves. Response of floating bridges and breakwaters to boat wakes are also studied. Computer programs are developed to implement and to give a complete design support for the mentioned structures. Dissert. Abstr.

PROPERTIES OF CONFINED CONCRETE SUBJECTED TO STATIC AND DYNAMIC LOADS Ph.D. Thesis
Shuaib Haroon Ahmad 1981 397 p
Avail: Univ. Microfilms Order No. 8120556

Accurate and reproducible complete stress-strain curves of unconfined and confined concrete subjected to uniaxial monotonic and cyclic compressive loads are investigated. Prior to systematically obtaining the stress-strain curves, the effect of the testing parameters (method of obtaining the descending portion of the stress-strain curve, effect of size, shape of the specimen, effect of age at testing) and methods of measuring (gage length effects for strain measurements) were also carefully studied. A constitutive law under multiaxial compressive loadings, for predicting the complete (ascending and descending portions) stress-strain curves was developed. A simple experimental technique (concrete confined in steel tube) was developed to obtain the post peak behavior under cylindrical trixial compressive loadings. Dissert. Abstr.

A CRITICAL VOID GROWTH FAILURE CRITERION DEVELOPED FOR DYNAMIC AND STATIC LOADING CONDITIONS Ph.D. Thesis
A. M. Rajendran 1981 74 p
Avail: Univ. Microfilms Order No. 8121255

The classical plastic instability which precedes ductile failure is examined under conditions in which inertia terms are significant. When the constitutive laws for incompressible materials are used in the dynamic stability analysis, the results confirm the experimental evidence which indicates that the plastic instability is inhibited by inertia. This analysis however, can not provide an instability criterion capable of predicting failure under dynamic loading. Replacing the incompressible model with one applicable to porous plastic materials, provides an alternative means to predict failure under both static and dynamic loading conditions by the introduction of a failure criterion based on a critical void volume fraction. Encouraging results are obtained when this failure analysis is applied to different experimental conditions in which the failure occurs under either low or high mean stress levels. The results indicate that a material may fail when the void volume fraction reaches a critical level, and that the critical level is not dependent on the type of loading process required to produce this void volume fraction. Dissert. Abstr.

THE BEHAVIOR AND STRENGTH OF LAPPED SPLICES IN REINFORCED CONCRETE BEAMS SUBJECTED TO CYCLIC LOADING Ph.D. Thesis
Anthony Daniel Tocci 1981 275 p
Avail: Univ. Microfilms Order No. 8119436

Tensile lap splices in reinforced concrete beams are studied using specimens subjected to repeated and reversed cyclic loading into the inelastic range. The parameters that influence the strength of tensile lap splices are valuated and guidelines for the design of splices to resist seismic loading are developed. Tests on full scale beam specimens which had either two no. 8 or two no. 10 main bars spliced in a region of constant moment or a region of combined moment and shear were conducted. The main variables studied are load history, the amount and distribution of transverse steel and the influence of shear. The number of cycles and maximum strain level in the inelastic range has a greater influence on splice performance than if load reversals are included in the loading sequence. Dissert. Abstr.

INELASTIC FINITE STRAIN ANALYSIS OF STRUCTURAL METALS SUBJECTED TO NONPROPORTIONAL LOADINGS Ph.D. Thesis
Nien-Tsu Tseng 1981 209 p
Avail: Univ. Microfilms Order No. 8122206

The formulation of material constitutive relationships and solution procedures to deal with inelastic finite strain analysis of structural metals subjected to nonproportional loadings is studied. When metal structures are undergoing strong earthquake ground motions, the loadings are nonproportional in nature and the strains in various locations of the structure should be treated as finite. In order to treat the dependent behavior of materials under nonproportional conditions, a rate independent plasticity model is proposed. Excellent correlation is established between the proposed model and experimental observations on stress relaxation, cyclic creep and other transitory phenomena of strain hardening or strain softening materials subjected to generalized uniaxial cyclic loadings. Dissert. Abstr.

(Contract NAS1-16133)
(NASA-CR-165792; CR-2-998) Avail: NTIS HC A07/MF A01 CSCL 20K

An extemely lightweight type of precision reflector antenna, being developed for potential deployment from the space shuttle, uses electrostatic forces to tension a thin membrane and form it into a concave reflector surface. The typical shuttle-deployed antenna would have a diameter of 100 meters and an RMS surface smoothness of 10 to 1 mm for operation at 1 to 10 GHz. NASA Langley Research Center built and is currently testing a subscale (16 foot diameter) model of the membrane reflector portion of such an antenna. Preliminary test results and principal factors affecting surface quality are addressed. Factors included are the effect of the perimeter boundary, splicing of the membrane, the long-scale smoothness of commercial membranes, and the spatial controllability of the membrane using voltage adjustments to alter the electrostatic pressure. Only readily available commercial membranes are considered. A.R.H.

Basic technical theories and engineering calculation equations for anisotropic plates and shells made of rigid reinforced plastics, mainly laminated fiberglass, are presented and discussed. Solutions are given for many problems of design of structural plates and shells, including curved sections and tanks, as well as two chapters on selection of the optimum materials, are given. Accounting for interlayer shearing and transverse separation, which are new engineering properties, are discussed. Application of the results obtained to thin three ply plates and shells wth a light elastic filler is presented and discussed. Author

THE RESPONSE OF TWO FLUID-COUPLED PLATES TO AN INCIDENT PRESSURE PULSE Progress Report, Nov. 1980 - Mar. 1981
R. S. Schechter and R. L. Bort 12 Oct. 1981 36 p refs
(SF43400001)
(AD-A104801; NRL-MR-4647) Avail: NTIS HC A03/MF A01 CSCL 19/4

The response of two plates coupled by an acoustic fluid to an incident pressure pulse is calculated using flat-plate theory. In addition, a similar calculation is done by a different method, where the interior fluid between the plate is modeled as a lumped parameter system of masses and springs. It is shown that as more masses and springs (fluid elements) are used that this solution approaches the continuous fluid solution. The cases where the second plate is backed by water and air are computed using both methods. The lumped-parameter model of the interior fluid is found to degrade the detail of the responses of the plates compared to the continuous-fluid solution, but the general features of the response (timing and magnitude of the peak velocities, for example) are not greatly affected even for relatively crude representations of the fluid, of two to five fluid elements. The calculations are carried out to better understand the interaction of a shockwave from an underwater explosion and the sail appendage of a submarine. Author (GRA)

VISCOPLASTIC AND CREEP CRACK GROWTH ANALYSIS BY THE FINITE ELEMENT METHOD Ph.D. Thesis. Final Report, Jul. 1977 - Jun. 1980
Terry D. Hinnerichs Jul. 1981 191 p refs
(AF Proj. 2307)
(AD-A105120; AFWAL-TR-80-4140) Avail: NTIS HC A09/MF A01 CSCL 11/6

Creep crack growth in a nickel base alloy at elevated temperatures was analyzed through a hybrid experimental-numerical (HEN) procedure. This HEN procedure consisted of simultaneous use of creep crack growth test displacement data from center cracked plate specimens of IN-100 at 1350 F and a theoretical finite element model of the test specimen. A two-dimensional (constant strain triangular) finite element program was developed which accounts for both nonlinear viscoplastic material behavior and changing boundary conditions due to crack growth. Three viscoplastic material models -- (1) Malvern Flow Law, (2) Norton's Creep Law, and (3) Bodner-Partom Flow Law -- were incorporated into the program. These time dependent material models were numerically integrated through time by a linear Euler extrapolation technique. A variable time step algorithm was included that maximized time step size during the analysis while maintaining good accuracy. This program was used as the plane stress theoretical model for the HEN procedure to analyze sustained load creep crack growth. A method for getting creep crack growth behavior solely from high resolution displacement measurements, in conjunction with a cracked specimen model which utilizes realistic constitutive relationships, has been developed. ACOUSTIC EMISSION FROM CONCRETE SPECIMENS Final Report, Apr. 1979 - Sep. 1980
P. F. Mlakar, R. E. Walker, and B. R. Sullivan Sep. 1981 39 p refs
(DA Proj. 4A1-61101-A-91D)
(AD-A105416; WES/MP/SL-81-26) Avail: NTIS HC A03/MF A01 CSCL 11/2

Six monotonic and six cyclic load compression tests on 6-by 12-in. cylindrical concrete specimens were monitored for acoustic emission. Fundamental data were collected and analyzed and the Kaiser effect was observed. The data are presented as counts versus events to aid in the identification of source characteristics. One multiaxial load (compression and tension) test was also monitored. The slope of counts versus event curve for this primarily tension test differed from those of the curves for the primarily compression test. This difference suggests that the source characteristics of concrete acoustic emissions can be empirically separated and identified. Author (GRA)

MINIATURIZED FATIGUE CRACK GROWTH SPECIMEN TECHNOLOGY AND RESULTS

R. J. Puigh, R. E. Bauer, A. M. Ermi, and B. A. Chin 11 Jun. 1981 16 p refs Presented at the 2nd Topical Meeting on Fusion Reactor Mater., Seattle, 9-12 Aug. 1981
(Contract DE-AC14-76FF-02170)
(DE81-029757; HEDL-SA-2475) Avail: NTIS HC A02/MF A01

The miniature fatigue crack propagation technology was extended to in-cell fabrication of irradiated specimens. Baseline testing of selected titanium alloys was performed at 250 C in air. At relatively small values for the stress intensity factor, (RADICAL)K, the crack growth rates for all titanium alloys investigated are within a factor of three. The crack growth rates for these titanium alloys are a factor of three greater than the crack growth rates of either 316 SS (20% CW) or HT-9. Each of the titanium alloys has observable crack propagation for stress intensity factors as small as 4.2 MPa(INTEGRAL)m. DOE

FRACTURE MECHANISMS OF SENSITIZED STAINLESS STEELS IN SULFUR-CONTAINING ENVIRONMENTS

R. C. Newman, K. Sieradzki, and H. S. Isaacs 1981 10 p refs Presented at the Intern. Conf. on Environ. Degradation of Eng. Mater., Blacksburg, Va., 21 Sep. 1981
(Contract DE-AC02-76CH-00016)
(DE81-026052; BNL-29671; CONF-810913-5) Avail: NTIS HC A02/MF A01

The stress corrosion cracking of sensitized type 304 stainless steel was studied in a 6 x 10 to the minus fourth M sodium thiosulfate solution at room temperature. Under constant extension rate conditions the crack initiation probability is a maximum at -100 mV (SCE) and approaches zero for a smooth surface at > -300 or < +300 mV. Initiated cracks propagate at high rates at potentials as high as +500 mV; a maximum crack velocity of 8 micrometers/sec was measured in a precracked specimen under constant load. Crack initiation probability can be correlated with the repassivation behavior of simulated grain boundary material, but the high crack propagation rates probably require a large contribution from intermittent mechanical grain boundary failure. WORKING STRENGTH OF NOTCHED SPECIMENS IN STEEL Ck45 AND STEEL 42 Cr Mo4 [BETRIEBSFESTIGKEIT VON KERBSTAEBEN AUS STAHL Ck 45 UND STAHL 42 CrMo4]

E. Haibach and C. Matschke 1980 108 p refs In GERMAN; ENGLISH summary
(LBF-FB-155(1980)) Avail: NTIS HC A06/MF A01

The working strength of notched steel specimens was investigated and the test results evaluated in connection with a damage accumulation calculation. The test program comprising 12 series and a total of 199 tests on notched specimens (Kt = 3.6) in steel Ck 45 or steel 42 CrMo 4, were performed by using programmed loading, random loading or a digitally reproduced service load sequence. In addition, 109 constant amplitude test results were considered for reference in an analyzing procedure based on the concept of uniform scatter bands applying to the S-N curves in question. A statistical analysis shows that the experimental scatter bands of the variable amplitude fatigue life curves are closely correlated to the particular scatter bands as computed by a modified version of Miner's rule, but with the experimental mean values being lower by factors of 0.883 to 0.911 in terms of stress. The results are tabulated. Author (ESA)

INFLUENCE OF A MULTIAXIAL MEMBRANE STRESS SITUATION ON THE STRESS CONCENTRATION FACTOR, USING THE EXAMPLE OF AN OPEN UNFINISHED DRILLED HOLE [UEBER DEN EINFLUSS EINES MEHRACHSIGEN MEMBRANSPANNUNGSZUSTANDES AUF DEN SPANNUNGSKONZENTRATIONSFAKTOR AM BEISPIEL EINER OFFENEN UNBEARBEITETEN BOHRUNG]

Lueder Schwarmann 12 Nov. 1979 14 p refs In GERMAN
(Ek-43-B/251/79) Avail: NTIS HC A02/MF A01

The stress concentration factor alpha C for a plate with limited width W, containing a circular drilled hole (diameter D) is calculated, using the linear elastic theory of elastomechanics. The factor alpha C does not only depend on the geometrical ratio D/W, but also on the applied membrane stresses Tx, Ty, Txy. Compared with one-axial tensile strain (y-direction), additional tensile strains (in the x-direction) cause a reduction of alpha C while an additional compressive strain (in the x-direction) and additional shear strain cause an increase in alpha C. The results are also valid for other groove problems. Author (ESA)

A TWO-LAYER GROUND HYDROLOGY MODEL INTERACTIVE WITH AN ATMOSPHERIC CIRCULATION MODEL Ph.D. Thesis

John Joseph Alfano 1981 641 p
Avail: Univ. Microfilms Order No. 8122768

A global ground hydrology model (GHM) consisting of a surface or upper root zone and a lower root zone is developed for use in an atmospheric general ciculation model (GCM) for studying land surface processes. The GCM calculates momentum, moisture, energy and pressure changes in the atmosphere by discretizing the global surface into cells, 4 deg latitude by 5 deg longitude, where the hydrology deg model provides these fluxes at the ground surface. The GHM operates in two modes. The first is a noninteractive mode where the GHM uses a set of prescribed meteorological data and the other is an interactive mode where the GCM and GHM are calculated simultaneously. The noninteractive mode is shown to be an efficient way to prepare and evaluate the GHM before it is used to the GCM. In the noninteractive mode the GHM reads a global data tape furnished from a previously run GCM contaning a standard ground hydrology model which may or may not be the same as the GHM. The GHM is an improvement over the standard hydrology model that exists in the GCM because it furnishes more realistic moisture and heat fluxes needed in calculating the global general ciculation. WORLDWIDE DIRECTORY OF NATIONAL EARTH-SCIENCE AGENCIES AND RELATED INTERNATIONAL ORGANIZATIONS

Wenonah E. Bergquist, comp., Elizabeth J. Tinsley, comp., Laura Yordy, comp., and Ralph L. Miller, comp. 1981 91 p
(USGS-CIRC-834) Avail: NTIS HC A05/MF A01

This edition of the 'Worldwide Directory' was prepared in response to continuing requests for up-to-date information on earth-science organizations. It provides addresses of governmental earth-science agencies around the world that have functions similar to those of one or more of the operating divisions of the U.S. Geological Survey; it also lists addresses of major international organizations that are concerned with some phase of the earth sciences. The directory is arranged alphabetically by the name of the country. The location of each country is shown on a small index map, which is keyed to one of eight reference maps showing major regions of the world. The index maps should be helpful to the user in identifying countries that have adopted new names or that have recently attained independence. L.F.M.

MODELING AS A TOOL
L. Postma Apr. 1981 14 p refs
(Publ-252; ISSN-0166-7521) Avail: NTIS HC A02/MF A01

The use of mathematical models to investigate problems in aquatic biology is introduced. Rules governing the construction of models are explained, (system identification, calibration, verification). The aims of models, (generation of hypotheses, estimation of parameters, extrapolation, etc.) are considered. Examples of tests of hypotheses, estimation of parameters, and transposition of results are illustrated by considering investigations of the death of the blue green algae anabaena in Lake Brielle, the meaning of light curves for algal succession, and of the succession of phytoplankton and zOO plankton in a reservoir. Models exist which predict the maximum biomass, but models for biomass plus transition states from one maximum to another, or zOO plankton and fish together have to be constructed by physicians, chemists, biologists and mathematicians working together. HYDROPHYSICAL INSTRUMENTATION AND COMPUTER COMPLEX
Ye. G. Nechesin, A. V. Nikitin, A. N. Paramonov, Ye. I. Timofeyev, and Yu. I. Shapovalov *In its* USSR Rept.: Earth Sci., No. 17 (JPRS-79342) 2 Nov. 1981 p 7-17 refs Transl. into ENGLISH from Upr. Sist. Mash. (Kiev), no. 3, May-Jun. 1981 p 100-106 (For primary document see N82-12489 03-42)
Avail: NTIS HC A05/MF A01

An instrumentation computer complex developed for onboard collection and primary processing of oceanographic data is described. The progressive concept of buswise organization ad modularity of the functional assemblies is the basis for the design of the complex. A block diagram of the complex is given. The submersible measurement system and the onboard data conversion and processing system are described. J.M.S.

43 EARTH RESOURCES

Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography.

REMOTE SENSING STUDIES OF SOME IRONSTONE GRAVELS AND PLINTHITE IN THAILAND Ph.D. Thesis
Pichit Jamnongpipatkul 1980 336 p
Avail: Univ. Microfilms Order No. 8177113

Ironstone gravels and plinthite in eastern Thailand were found to be associated with alluvial terraces as well as shale and basalt formation. Selected stereopairs of airphotos of known areas of ironstone gravels and plinthite were studied. The keys for airphoto interpretation were developed on the basis of the relation with types of landform, vegetation and appearance on the airphotos. Visual analysis of LANDSAT data provided information on the types of LANDSAT and vegetation which could lead to more detailed investigation of probable areas of ironstone gravels and plinthite. Digital analysis of LANDSAT data indicated that the difference of spectral reflectances from areas of ironstone gravels and those from the surrounding areas is considerable. Field study was conducted to verify the results of airphotos interpretation and LANDSAT data analysis and to obtain information in regard to genesis and morphology of soils with ironstone gravels and plinthite. Soil profile descriptions for typical soils with ironstone gravels and plinthite are included. Dissert. Abstr.

DESERT SAND SEAS
Edwin D. McKee, Carol S. Breed (Geological Survey, Flagstaff, Ariz.), and Steven G. Fryberger (Geological Survey, Flagstaff, Ariz.) *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 5-48 refs (For primary document see N82-12492 03-43)
Avail: NTIS MF A01; SOD HC$16.50 CSCL 08B

The usefulness of manned observations and handheld-camera photographs from space is confirmed by the immediate application of Skylab 4 data to the study of sand seas. The Skylab 4 crew provided information that: (1) confirms a tentative global classification of eolian sand deposits based on observed similarities in most of the major deserts of the world; (2) allows the preparation of maps that show the relationships of sand deposits to each other, to sand source areas, to natural sand distribution barriers, and to human land use; and (3) allows the regional patterns of large-scale dune morphology to be studied in relation to rainfall distribution and surface winds. Four sites in the Sahara and sub-Sahara of northern Africa, four in the Namib and Kalahari Deserts of southern Africa, two in the Empty Quarter of Saudi Arabia, five in the Takla Makan and Gobi Deserts of China, and three in the trans-Caspian deserts of the U.S.S.R. were selected as well as additional areas in northern Africa, India, Mexico, and Australia. A.R.H.

GEOLOGICAL FEATURES OF SOUTHWESTERN NORTH AMERICA
L. T. Silter, T. H. Anderson, C. M. Conway, J. D. Murray, and R. E. Powell *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 89-136 refs (For primary document see N82-12492 03-43)

Avail: NTIS MF A01; SOD HC $16.50 CSCL 08G

Photographic and visual observation of geological target areas were integrated with other aspects of the ground investigations to: (1) identify and evaluate zones of major faulting in south eastern California, Baja California, and northwestern Sonora; (2) develop a new key to the regional stratigraphy of the prebatholithic rocks of northern Baja California; (3) discover the most southwesterly known occurrence of Precambrian crystalline rocks in North America; (4) discover a previously unmapped section of Mesozoic volcanic rocks in southeastern California; and (5) contribute important overview perspectives to many regional geologic problems. Skylab 4 data are discussed for the San Andreas fault system and architecture of Southern California; Nothern Baja, California; Sierra Mazatan and Sierra del Alamo in Sonora, Mexico; the northwest Sonora coast fault zones; and Arizona, including that portion of the Colorado Plateau in the vicinity of the Grand Canyon. A.R.H.

SKYLAB 4 OBSERVATIONS OF VOLCANOES. PART A: VOLCANOES AND VOLCANIC LANDFORMS. PART B: SUMMIT ERUPTION OF FERNANDIAN CALDERA, GALAPAGOS ISLANDS, ECUADOR

Jules D. Friedman, Grant Heiken (Los Alamos Scientific Labs., New Mexico), Tom Simkin (Smithsonian Inst., Washington, D.C.), and Arthur F. Krueger (NOAA, Washington, D.C.) *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 137-173 refs (For primary document see N82-12492 03-43)

Avail: NTIS MF A01; SOD HC $16.50 CSCL 08K

Terrestrial volcanic features were observed and photographed from Skylab 4 under a variety of viewing conditions and Sun angles. Eruptions of Sakura-zima in southern Kyushu, Japan and the remote Fernandina volcano in the Galapagos Islands provided rare documentation of eruption clouds. Remote volcanic regions were also surveyed including the Tibesti volcanic massif and the Emi Koussi Caldera in Chad; the Altiplano volcanic field of Bolivia, Argentina, and Chile; the Kanchatcha Penninsula, U.S.S.R.; and the southeastern central plateau of Mexico. The landforms of volcanic provinces of Hawaii, southern Italy, the Aleutian Islands, Oregon, and Washington State were also investigated. Previously unobserved relationships between geomorphology and structure and previously unmapped tectonic ligaments were revealed as well as stratigraphic or relative age distinctions between partly overlapping basaltic flows. A.R.H.

THE MANICOUAGAN IMPACT STRUCTURE OBSERVED FROM SKYLAB

M. R. Dence *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 175-190 refs (For primary document see N82-12492 03-43)

(Contrib-544) Avail: NTIS MF A01; SOD HC $16.50 CSCL 08B

From comprehensive views of eastern Canada provided by Skylab oblique photographs, the main elements of the multi-ring Manicougan structure can be defined. By gravitational scaling, the structure is an analog for 200 km diameter structures on Mars and Mercury and 400 km to 500 km basins on the Moon. Because much larger structures on the other planets have rings spaced at intervals of 2 to the 1/2 power spacing, it is of interest to know if rings with intermediate spacing can be identified. SNOW-MAPPING EXPERIMENT

James C. Barnes, Clinton J. Bowley, J. Thomas Parr, and Michael D. Smallwood *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 191-224 refs (For primary document see N82-12492 03-43)

Avail: NTIS MF A01; SOD HC $16.50 CSCL 08L

More than 300 hand-held camera photographs were taken of most part of the United States in which snow existed during the mission. The sites include the Sierra Nevada in California; the Salt-Verde Watershed in central Arizona; the Rocky Mountains in Colorado; the Great Salt Lake and Yellowstone Park in Utah and Wyoming; the Cascade Range in Washington and Oregon; the Black Hills in South Dakota; the Central Plains; and the Great Lakes. Snow in the European Alps; the Caucasus and Himalaya Mountains; the Pacific coastal areas of the U.S.S.R.; and New Zealand was also mapped. The experiment shows that: (1) a space observer can identify snow that photointerpreters cannot distinguish on a photograph of the same area, (2) can integrate, through partial cloud cover, to view the terrain, and (3) can select the optimum viewing angle and Sun angle and the appropriate film and filter combination to acquire the best data. A.R.H.

N82-12499*# Texas Univ. at Austin.

CULTURAL FEATURES IMAGED AND OBSERVED FROM SKYLAB 4

Robert K. Holz *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 225-242 refs (For primary document see N82-12492 03-43)

Avail: NTIS MF A01; SOD HC $16.50 CSCL 08B

Data from Skylab 4 observations of metropolitan complexes are limited to city outline, major transportation arteries, suburban built-up areas, overall textural patterns of the city as compared to those of adjacent areas, and the color or albedo. Typical agricultural patterns, forest regions, and transportation networks on rural landscapes can be discerned, as well as the disturbances of soil during construction and mining which expose surface materials of a different albedo. Photographs of Denver, Colorado, San Antonio, Texas, Chicago, Illinois, and San Diego, California are analyzed. A.R.H.

N82-12500*# California Univ., Berkeley.

VEGETATION PATTERNS

David M. Carneggie and Brain T. Fine (California Univ. at Davis) *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 243-262 refs (For primary document see N82-12492 03-43)

Avail: NTIS MF A01; SOD HC $16.50 CSCL 08F

In an effort to make meaningful observations of vegetation resources, the following sites and features were examined: (1) wheat in Argentina, Australia, and the U.S.; (2) rangelands in Australia, Africa, and the U.S.; (3) land use in Malayasia; (4) vegetation in New Zealand; (5) agriculture in California; (6) drought in northern Australia; (7) insect and disease damage in any of the sites; and (8) forest and range fires wherever found. The important factors that governed the ability of the crew to observe these features were angle of view from the spacecraft; atmospheric conditions; Sun angle; speed of the spacecraft; characteristics of natural and cultivated vegetation; and familiarity with the phenomena to be observed. User reaction to the imagery is discussed and photograph quality is evaluated. A.R.H.

REPORT ON SKYLAB 4 AFRICAN DROUGHT AND ARID LAND EXPERIMENT

N. H. MacLeod, J. S. Schubert, and P. Anaejionu *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 263-286 refs (For primary document see N82-12492 03-43)

Avail: NTIS MF A01; SOD HC $16.50 CSCL 08B

Vegetation patterns, flooding, soil erosion, interdunal water accumulation, natural drainage systems, and drainage patterns in the Black Volta and White Volta River basins were observed and photographed in an effort to determine the causes of desertification in the Sahel. The Niger Island delta in Mali was selected to examine the distribution and changing patterns of vegetation and flooding of the major freshwater resources in that drought-prone area. Observations Nimbus-3, Apollo-9, and Skylab of dust and cloud movements, vegetation patterns, land surface features, the color and distribution of surface water, and color changes of lakes within the drought zone show that widespread destructice land practices contribute to the arid conditions. A.R.H.

AN ASSESSMENT OF THE POTENTIAL CONTRIBUTIONS TO OCEANOGRAPHY FROM SKYLAB VISUAL OBSERVATIONS AND HANDHELD-CAMERA PHOTOGRAPHS
George A. Maul and Michael McCaslin *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 339-352 (For primary document see N82-12492 03-43)
Avail: NTIS MF A01; SOD HC $16.50 CSCL 08J

The possible roles that space observes may play in oceanographic experimentation are considered in a discussion of several ocean photographs and visual observations made during the Skylab 4 mission. While hand-held camera photography has a distinct role in reconnaissance, it cannot surpass the quantitativeness of a multispectral observation from a known altitude. Significantly, many of the most interesting scenes were taken by the S190B camera, which produced very high resolution photographs taken from a vertical position. From the standpoint of long term oceanographic observation, quantitative observations are needed with accurate geographical positioning. Concurrent ocean surface observations are also needed to correlate the data. A.R.H.

N82-12504*# Geological Survey, Tacoma, Wash.
VISUAL OBSERVATIONS OF FLOATING ICE FROM SKYLAB
W. J. Campbell, R. O. Ramseier (Dept. of Environment, Ottawa, Ontario), W. F. Weeks (Cold Regions Research and Engineering Lab.), and J. A. Wayenberg *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 353-380 refs (For primary document see N82-12492 03-43)
Avail: NTIS MF A01; SOD HC $16.50 CSCL 08L

The lake and sea ice visual observation experiment performed during the Skylab 4 mission was very successful. In the initial experiment design, the Gulf of St. Lawrence and Lake Ontario were chosen as prime sites at which ground-truth measurements and aircraft remote-sensing data were to be obtained. In addition, the Skylab 4 astronauts obtained excellent photographs of sea ice in the Sea of Okhotsk and in the James Bay portion of Hudson Bay and of icebergs in the Southern Ocean. Some of the sequential photographs contain very useful broad-scale information on the distribution of ice and ice types, the overall deformation patterns, and the amount of relative ice motion. A.R.H.

N82-12505*# Air Resources Lab., Las Vegas, Nev.
QUANTITATIVE ANALYSIS OF ATMOSPHERIC POLLUTION PHENOMENA
Darryl Randerson *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 381-406 refs (For primary document see N82-12492 03-43)
Avail: NTIS MF A01; SOD HC $16.50 CSCL 13B

Approximately 75 photographs of air pollution events were taken during the 84-day Skylab 4 mission. This imagery may be separated into two categories according to the sources of the pollution: natural pollution, which consists of dust generated by wind, naturally induced forest fires, and smoke generated by volcanic activity, and manmade pollution, which includes brush fires, smoke plumes from stacks or open burning, contrails, and ship trails. Results of the analysis of some of the most interesting photographs are discussed in this section. Photographs of the following are analyzed: the Sakura-zime volcanic activity; dust clouds, the Los Angeles pollution pall; long smoke plume; an African brush fire, an Argentine forest fire, cirrus cloud plumes, and a snow streak. A.R.H.

SOME ASPECTS OF TROPICAL STORM STRUCTURE REVEALED BY HANDHELD-CAMERA PHOTOGRAPHS FROM SPACE
Peter G. Black *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 417-462 refs (For primary document see N82-12492 03-43)
Avail: NTIS MF A01; SOD HC $16.50 CSCL 04B

The most important contribution to the fields of tropical storm research was the stereophotography of tropical storm Ellen during the Skylab 4 mission. Features of mature tropical storms revealed by Skylab 4 photographs are discussed and compared with data obtained by NOAA-2, Nimbus-5, and a DMSP satellite. A.R.H.

N82-12508*# Chicago Univ., Ill.
MESOSCALE WAKE CLOUDS IN SKYLAB PHOTOGRAPHS
T. Theodore Fujita and Jaime J. Tecson *In* NASA. Johnson Space Flight Center Skylab Explores the Earth 1977 p 463-478 refs (For primary document see N82-12492 03-43)
Avail: NTIS MF A01; SOD HC $16.50 CSCL 04B

Examination of mesoscale cloud patterns within the wakes of obstacles seen in Skylab photographs reveals the existence of specific types of wake clouds. Cumulus streets occur when the lapse rate above the surface is adiabatic with a medium to slow flow rate. Karman vortex streets occur when the lapse rate above the surface is small, zero, or negative, with a slow to medium flow impinging against a relatively large obstacle. Wake waves occur when the lapse rate above the surface is small with a medium to fast flow rate impinging against a relatively small obstacle. When the flow rate exceeds a critical value, the transverse waves tend to disappear, leaving only the diverging waves. These phenomena are illustrated in Skylab photographs of the Aleutian Islands, the Kuril Islands, the Antipodes, South Pacific Islands, and the Bouvet Island in the South Atlantic. A.R.H.

PROGRESS IN RADAR SNOW RESEARCH
W. Stiles, F. T. Ulaby, A. K. Fung, and A. Aslam Feb. 1981 167 p refs
(Grant NsG-5335)
(NASA-CR-166709; RSL-TR-410-1) Avail: NTIS HC A08/MF A01 CSCL 08L

Multifrequency measurements of the radar backscatter from snow-covered terrain were made at several sites in Brookings, South Dakota, during the month of March of 1979. The data are used to examine the response of the scattering coefficient to the following parameters: (1) snow surface roughness, (2) snow liquid water content, and (3) snow water equivalent. The results indicate that the scattering coefficient is insensitive to snow surface roughness if the snow is drv. For wet snow, however, surface roughness can have a strong influence on the magnitude of the scattering coefficient. These observations confirm the results predicted by a theoretical model that describes the snow as a volume of Rayleig scatterers, bounded by a Gaussian random surface. In addition, empirical models were developed to relate the scattering coefficient to snow liquid water content and the dependence of the scattering coefficient on water equivalent was evaluated for both wet and dry snow conditions. LIMIT ON REMOTE FTIR DETECTION OF TRACE GASES
A. S. Zachor (Atmospheric Radiation Consultants, Inc.), B. Bartschi, and M. Ahmadjian (AFGL) Sep. 1981 7 p refs
(Contract F19628-77-C-0203; AF Proj. 7670)
(AD-A104842; AFGL-TR-81-0272) Avail: NTIS HC A02/MF A01 CSCL 20/6

We studied the capability of a Fourier spectrometer system to remotely detect trace gases in localized clouds, e.g., stationary source effluents. Detection is based on the degree to which the observed IR spectral radiance contrast between the cloud and adjacent background is correlated with a computed reference spectrum. It is shown that trace gases can be reliably detected when spectral features are well below the noise level. The minimum detectable quantities (MDQ's) for various trace gases at one atmosphere total pressure are given. The MDQ's determine the combinations of gas column thickness and gas-background temperature difference that correspond to 95 percent detection probability and one percent false detection probability when an FTS system with modest-size foreoptics views the target through a path equivalent to approximately one air mass. CHEMICAL AND GEOCHEMICAL STUDIES OFF THE COAST OF WASHINGTON Progress Report, Sep. 1980 - Jul. 1981
R. Carpenter, comp. Jul. 1981 14 p refs
(DE81-030319; DOE/EV-70024/44) Avail: NTIS HC A02/MF A01

A series of marine chemical and geochemical investigations involving both laboratory studies and field studies off the coast of Washington is addressed. Most of the field work was on the Washington continental shelf, slope, and the submarine canyons indenting the shelf north of the Columbia River. The aim is to provide basic data required to characterize underlying chemical and physical processes and their rates which control the distributions, concentrations, and ultimate fate of some of the potentially hazardous agents associated with fossil fuel and/or nuclear power production or transportation. Laboratory and field experiments and theories derived from are used iteratively to investigate: (1) vertical transfer of trace chemicals from surface seawaters to underlying waters and sediments; (2) processes which may transfer certain chemicals from sediments back into the overlying water column; (3) redox processes which besides changing valence states of certain chemicals may alter their precipitation/dissolution tendencies, their biological availability and/or toxicity; and (4) accumulation histories of potentially hazardous chemicals in sediments during the past 100 years. DOE

FORMATION EVALUATION IN LIQUID-DOMINATED GEOTHERMAL RESERVOIRS
Iraj Ershaghi, Elmer E. Dougherty, and Lyman L. Handy Apr. 1981 106 p refs
(Contracts DE-AT03-76ET-28384; EY-76-S-03-0113)
(DOE/ET-28384/T1) Avail: NTIS HC A06/MF A01

Studies relative to some formation evaluation aspects of geothermal reservoirs are reported. The particular reservoirs considered were the liquid dominated type with a lithology of the sedimentary nature. Specific problems of interest included the resistivity behavior of brines and rocks at elevated temperatures and studies on the feasibility of using the well log resistivity data to obtain estimates of reservoir permeability. Brine viscosity data at elevated temperatures, effect of dissolved gases on brine resistivity, design of a modified API filter test apparatus, and modeling of filter cake buildup during drilling are discussed. DOE

HYDROLOGIC STUDIES SUPPORT, INTERCOMP CODE CONVERSION Annual Report
Vernon I. Ichimura 16 Oct. 1980 57 p refs
(Contract DE-AT06-79RL-10119)
(DE81-030318; DOE/RL-10119/1; RR-80/15-44) Avail: NTIS HC A04/MF A01

The primary cause of mass and energy balance errors noted in IBM xecuted INTERCOMP code results are due to lack of precision in computing the global values of mass and energy. The correction of this problem led to numerical comparisons between the CDC and IBM computer results. The differences are greatest at an onset of a physical system perturbation and decrease with succeeding time steps. Good numerical comparison with analytical solutions seem to further prove the authenticity of code results. DOE

RESOURCE ASSESSMENT OF LOW AND MODERATE-TEMPERATURE GEOTHERMAL WATERS IN CALISTOGA, NAPA COUNTY, CALIFORNIA Progress Report, 1979 - 1980
Les G. Youngs, C. Forrest Bacon, Rodger H. Chapman, Gordon W. Chase, Chris T. Higgins, Hasmukhrai H. Majmundar, and Gary C. Taylor 10 Nov. 1980 394 p refs
(Contract DE-FG03-79ET-37035)
(DE81-025559; DOE/ET-37035/T1) Avail: NTIS HC A17/MF A01

The USGS Geotherm file for California was updated and completed and the final data were compiled for a geothermal resources map of the State. The methodology used to determine the depth, configuration, flow rate, capacity, water quality, and location of the hottest water in the reservoir at Calistoga is described. The historical use of the resource is reviewed. Other aspects considered include general geology, magnetic surveys, gravity surveys, seismic reflection, and electrica resistivity of the resource. The hydrology and groundwater quality are related to the geological structure and formation as well as to resource assessment. The development of models for volume and temperature, and explatory drilling are also discussed. DOE

EXTENSIBLE BRIDGE-CONVEYOR CONCEPT DEVELOPMENT Final Technical Report
James C. Swain and Edward C. Mullen 21 Apr. 1981 92 p refs
(Contracts DE-AC01-79ET-14210; DI-BM-JO-177051)
(DE81-031973; DOE/ET-12453/T1) Avail: NTIS HC A05/MF A01

Optimum applications for the CES were identified. Concepts were developed for the interfaces between system components and between the CES and the continuous miner and the room conveyor. Configurations were chosen for the CES which optimize system use in the applications identified. Cost estimates were prepared and general operating specifications were defined. Chain was selected as the preferred conveying element. The CES appeared to be a logical choice over shuttle cars in low to medium seam mines and over conventional continuous haulage in seams up to 80 inches if 88 percent availability is obtained, and if typical entry and crosscut centerline distances are employed. Longer centerline distances imply clear advantages for the CES concept. T.M.

EVALUATION OF NOVEL UNDERGROUND TRANSPORT SYSTEMS Final Report
Jun. 1981 134 p refs
(Contract DE-AC01-79ET-11268)
(DE81-030279; DOE/ET-11268/T3) Avail: NTIS HC A07/MF A01

The feasibility of new or novel underground haulage equipment for transporting personnel and supplies is assessed to determine their relative impact on productivity and the cost per ton that is attributable to this segment of the mining operation. Novel equipment in its current design can potentially alleviate many of the personnel and supply problems encountered in United States coal mines. A review of rail haulage systems and European underground mining provided the basis for the introduction of three novel haulage systems: monorail, floor-mounted trapped rail haulage, and chairlifts. It was determined that monorail and floor-mounted trapped rail haulage systems exhibit the highest potential for domestic utilization. Monorail haulage equipment along with conventional battery powered rubber-tired equipment and two rail haulage systems were theoretically applied to five different mine sizes. Each system was then reviewed on an economic, operational, maintenance, and safety basis. From each standpoint, the monorail compared favorably with the other haulage systems. DOE

FEASIBILITY ANALYSIS OF TRENCH STRIP AND AUGER MINING Summary Report
Jun. 1981 209 p refs
(Contract DE-AC01-79ET-11268)
(DE81-027557; DOE/ET-11268/14) Avail: NTIS HC A10/MF A01

The feasibility of using Trench Strip and Auger Mining as a means to extract coal reserves which are presently considered uneconomical to mine or which would present undesirable environmental effects if extracted using conventional surface mining methods is assessed. The conclusion is that Trench Strip and Auger Mining, when used as a primary mining system, is a viable alternative to conventional surface mining. Economically, a savings in the selling price of at least $12 per ton (from $28 to $16) can be realized with this concept. Environmentally, the amount of surface area disturbed can be reduced to half, and the amount of overburden handled can be reduced to one-seventh that of a conventional mine. It was also discovered that the trench mine gave similar results on certain surface minable sites that are economically and environmentally sound. DOE

DATA BASE FOR THE ANALYSIS OF COMPOSITIONAL CHARACTERISTICS OF COAL SEAMS AND MACERALS Quarterly Technical Progress Report, Feb. - Apr. 1981
A. Davis, N. H. Suhr, W. Spackman, P. C. Painter, P. L. Walker, and P. H. Ogiven Aug. 1981 96 p refs
(Contract DE-AC22-80PC-30013)
(DE81-031977; DOE/PC-30013/5) Avail: NTIS HC A05/MF A01

The first objective of the program is to understand the systematic relationships between the properties of coals and the second is to determine the nature of lateral and vertical variability in the properties of a single seam. Four coal samples showed significant decrease in calorific value during storage over a two-year period; the lower the calorific value and the higher the moisture of the samples, the greater was the decrease. Ninety-three coal samples and 454 selected printouts of coal data were provided on request to the coal research community. Maceral analysis of 5-cm subsections of column samples of the Lower Kittanning seam reveal some differences in the profiles of the seam collected from two different environmental settings. General trends in carbon, hydrogen, oxygen and nitrogen contents of the Lower Kittanning seam of western Pennsylvania are presented. DOE

PEAT RESOURCE EVALUATION: STATE OF MAINE Quarterly Report
Joel Davis and Walter Anderson 1981 7 p
(Contract DE-FG18-79FC-14690)
(DE82-000227; DOE/FC-14690/T1) Avail: NTIS HC A05/MF A01

The amount and location of fuel-grade peat that may be harvested and utilized in an environmentally acceptable manner in Maine were surveyed. The resources inventory provides a detailed evaluation of the peat deposits including maps showing areal extent, thickness, and distribution of peat, stratigraphic cross sections, and surficial mapping. Many deposits were visited to accurately assess the physical characteristics of the deposits and to obtain laboratory samples. Representative samples from surveyed deposits are obtained through standard field sampling techniques. DOE

PEAT DEPOSITS OF DISMAL SWAMP POCOSINS: CAMDEN, CURRITUCK, GATES, PASQUOTANK, AND PERQUIMANS COUNTIES, NORTH CAROLINA

R. L. Ingram and Lee J. Otte (Kent State Univ., Ohio) Jul. 1981 31 p refs
(Contract DE-AC01-79ET-14693)
(DE81-029642; DOE/ET-14693/T3) Avail: NTIS HC A03/MF A01

The presence of peat is examined in the Dismal Swamp of northeastern North Carolina and southeastern Virginia. The deposits in North Carolina occupy an area of 76,800 acres containing about 68 million tons of moisture free peat. The deposits greater than 4 ft thick occupy an area of 34,700 acres containing about 43 million tons of peat. The surface elevation of the peat ranges from 15 to 20 ft. Two main types of peat are present: (1) a brown, decomposed fibrous peat usually found at the base of the thicker peats, and (2) a black, fine grained, highly decomposed peat that usually overlies the fibrous peat. Both peat types contain large amounts of wood. The moisture content ranges from 40 to 94% and usually increases with depth and total thickness of the peat. It is found that heat values for moisture free, low ash peats range from 8700 to 10,900 Btu/lb and the sulfur content ranges from 0.2 to 0.7%. DOE

N82-12525# Battelle Columbus Labs., Ohio.

EXTENSIBLE BRIDGE-CONVEYOR CONCEPTS FOR COAL-MINE FACE HAULAGE Final Technical Report

James C. Swain, David L. Thomas, and Edward C. Mullen 1981 87 p
(Contracts DE-AC01-79ET-14210; DI-DM-JO-177051)
(DE81-031974; DOE/ET-14210/T1) Avail: NTIS HC A05/MF A01

The objective was to develop design concepts for extensible bridge conveyors which can be used in multiples to form a continuous haulage system. Consultation services were provided by Jeffrey Mining Machinery Division on mining technology and B.F. Goodrich Engineered Systems Division on conveyor belt technology. Additional information was gathered in a mine visit, during visits to conveyor manufacturers, and contacts with several component suppliers. Three extensible conveyor approaches were selected and machinery arrangement and internal detail drawings were prepared for each. Two of the concepts are for a face haulage system in which separate nonconnected extensible conveyors are individually trammed into position to form a continuous haulage system. The third concept is for a connected extensible system similar to existing continuous face haulage systems but employing extensible rather than fixed-length bridges. Cost estimates were prepared for the three concepts. The concepts developed employ belt-type conveyors, however, chain-type conveyors were considered to be a viable alternative. DOE

INTERACTIVE COMPUTER METHODS FOR GENERATING MINERAL-RESOURCE MAPS

James A. Calkins, Alan S. Crosby, Tod E. Huffman, Allen L. Clark, George T. Mason, Jr., and Robert J. Bascle 1980 75 p refs Presented at the 2nd U.S. Geol. Surv. Computer Symp., Reston, Va., 22-23 Mar. 1978
(CIRC-815) Avail: NTIS HC A04/MF A01

Two related methods for plotting computer generated maps as alternatives to conventional batch methods are devised. These methods are: Quick Plot, an interactive program whose output appears on a cathoe ray tube (CRT) device, and the interactive cartographic automatic mapping system (CAM), which combines batch and interactive runs. The output of the Interactive CAM system is final compilation (not camera-ready) paper copy. Both methods are designed to use data from the Computerized Resource Information Bank (CRIB) file in conjunction with a map-plotting program. Quick Plot retrieves a user selected subset of data from the CRIB file, immediately produces an image of the desired area on a CRT device, and plots data points according to a limited set of user selected symbols. The interactive CAM system links the output of an interactive CRIB retrieval to a modified version of the CAM program, which runs in the batch mode and stores plotting instructions on a disk, rather than on a tape. ENGLISH summary
(Ser-B-248; ISSN-0071-9196) Avail: NTIS HC A06/MF A01

The results of the determination of geographic longitudes, latitudes and azimuths at the Laplace stations Bad Sachsa, Rowensberg, and Wulften, Recke, are reported. The azimuth from Wulften, Recke, to Bad Lauterberg, Gr. Knollen was measured. All three stations are triangulation points of the second order net. As reference station for the time determination, the observatory of Goettingen, meridian circle Reichenbach, was used. Its astronomic longitude is related to Hamburg, German Hydrographic Institute, in the BIH system of 1957/58. The observations performed, taking into account polar motion, are: (1) time (star transit times in the meridian, FK 4 - catalog); (2) latitude (meridian-zenith differences according to Horrebow-Talcott, general catalog with transformation to the system of FK 4); and (3) azimuth (star transit times in the azimuth of the earth target, FK 4 - catalog). The results are tabulated. An automatic recording and preprocessing system for the observation and evaluation of transit times is also described. Author (ESA)

A TWO-DIMENSIONAL STUDY OF THE MAXIMUM POWER THAT CAN BE OBTAINED FROM A WIND TURBINE IN A WIND SHEAR LAYER
Bo C. A. Johansson Apr. 1981 60 p refs
(FFA-134) Avail: NTIS HC A04/MF A01

A two dimensional study, where the undisturbed velocity field is given and allowed to vary arbitrarily vertically, and the location of the wind turbine is given, is presented. The maximum power is calculated by the method of calculus of variations. The maximum power of common wind velocity profiles is only slightly larger than the power, which is obtained by a constant relative wind speed retardation, while for a linear velocity profile there is a considerable difference. AN ACTIVE ALIGNMENT SCHEME FOR THE MPTS ARRAY

Richard Iwasaki *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 p 26-31 (For primary document see N82-12538 03-44)

Avail: NTIS HC A99/MF A01 CSCL 10A

In order to maximize the efficiency of the microwave power transmission system (MPTS), the surface of the array antenna must be extremely flat, which is difficult to achieve using passive techniques over the 1 km dimensions of the array. In order to achieve and maintain this required flatness, a rotating laser beam used for leveling applications on Earth was utilized as a reference system. A photoconductive sensor with a reflective collecting surface was used to determine the displacement and polarity of any misalignment and automatically engage a stepping motor to drive a variable-length mechanism to make the necessary corrections. Once aligned, little power is dissipated since a nulling bridge circuit that centers on the beam is used, an important alignment feature since even laser beams broaden considerably at 1 km distances. T.M.

PROPOSED EXPERIMENTAL STUDIES FOR ASSESSING IONOSPHERIC PERTURBATIONS ON SPS UPLINK PILOT BEAM SIGNAL

Santimay Basu and Sunanda Basu *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 p 44-54 refs (For primary document see N82-12538 03-44)

(Contract F19628-78-C-0005; Grant NSF ATM-78-25264)

Avail: NTIS HC A99/MF A01 CSCL 10A

The microwave beam of the proposed Solar Power Satellite (SPS) at geosynchronous altitude is to be formed and directed by phase information derived from a pilot signal at 2.45 GHz transmitted from ground and received in a number of module locations on the SPS antenna. The frequency of the pilot signal was chosen to be sufficiently low as to avoid the effects of strong scattering by turbulence in the neutral atmosphere and yet high enough to avoid any possible reofractive effects caused by the ionized upper atmosphere. The propagation of the uplink pilot signal through the ionosphere which contains natural and possibly some artificial irregularities, was studied. T.M.

DESIGN AND BREADBOARD EVALUATION OF THE SPS REFERENCE PHASE CONTROL SYSTEM CONCEPT

P. M. Hopkins and V. R. Rao *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 p 75-84 (For primary document see N82-12538 03-44) (Contract NAS9-15800)

Avail: NTIS HC A99/MF A01 CSCL 10A

Efficient operation of a very large phased array such as the proposed solar power satellite, requires precision focusing and pointing of the power beam; i.e., the power beam must have a planar wavefront directed precisely at the center of the target antenna (rectenna). To maintain such a power beam requires real-time phase compensation at each subaperture in order to adjust for structural deformations and other transitory factors. In the current solar power satellite (SPS) baseline, the spaceborne antenna (Spacetenna) is an active retrodirective array. A pilot signal transmitted from the center of the rectenna is phase-conjugated at each subaperture (power module) of the spacetenna, thereby assuring that the radiated composite wave is focused on the target. This scheme requires a large amount of precision electronic circuitry on the spacetenna. Specifically, pilot receivers must be located at each power module and an adaptive distribution network is required in order to provide a properly phased reference signal at each conjugator. T.M.

COHERENT MULTIPLE TONE TECHNIQUE FOR GROUND BASED SPS PHASE CONTROL

C. M. Chie *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 p 85-94 refs (For primary document see N82-12538 03-44)

(Contract NAS9-15782)

Avail: NTIS HC A99/MF A01 CSCL 10A

The ground based phase control concept was studied as an alternative approach to the reference SPS phase control system. The details of the ground based phase control system study are documented. The coherent multiple tone technique used for the ground based phase measurement waveform design and phase control system is summarized. T.M.

N82-12547*# Novar Electronics Corp., Barberton, Ohio.

AN INTERFEROMETER-BASED PHASE CONTROL SYSTEM

James H. Ott and James S. Rice *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 p 95-98 refs (For primary document see N82-12538 03-44)

Avail: NTIS HC A99/MF A01 CSCL 10A

A system for focusing and pointing the SPS power beam is discussed. The system is ground based and closed loop. One receiving antenna is required on Earth. A conventional uplink data channel transmits an 8-bit phase error correlation back to the SPS for sequential calibration of each power module. Beam pointing resolution is better than 140 meters at the Rectenna. T.M.

N82-12548*# Novar Electronics Corp., Barberton, Ohio.

A SONIC SATELLITE POWER SYSTEM MICROWAVE POWER TRANSMISSION SIMULATOR

James H. Ott and James S. Rice *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 p 97-99 ref (For primary document see N82-12538 03-44)

Avail: NTIS HC A99/MF A01 CSCL 10C

A simulator which generates and transmits a beam of audible sound energy mathematically similar to the SPS power beam is described. The simulator provides a laboratory means for analysis of ground based closed loop SPS phase control and of ionospheric effects on the SPS microwave power beam. T.M.

N82-12549*# Boeing Aerospace Co., Seattle, Wash.

SPS PHASE CONTROL STUDIES

W. W. Lund, B. R. Sperber, and G. R. Woodcock *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 p 100-109 (For primary document see N82-12538 03-44)

Avail: NTIS HC A99/MF A01 CSCL 10A

To properly point and form the SPS microwave power beam, the outputs of the power amplifiers in the transmitting array must be phased in a specific and coherent fashion. The purpose of the SPB phase control system is to bring this about reliably. A number of different phase control schemes were studied. The one selected for the SPS baseline system is a retrodirective CW phase that is distributed via fiber optics. The basis of this selection is relative technical simplicity and requisite assurance of success. T.M.

N82-12560*# Boeing Aerospace Co., Seattle, Wash.

SPS FIBER OPTIC LINK ASSESSMENT

T. O. Lindsay and Ervin J. Nalos *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 p 110-114 (For primary document see N82-12538 03-44)

Avail: NTIS HC A99/MF A01 CSCL 10A

Fiber optic technology was selected in the SPS baseline design to transmit a stable phase reference throughout the microwave array. Over a hundred thousand microwave modules are electronically steered by the phase reference signal to form the power beam at the ground receiving station. The initially selected IF distribution frequency of the phase reference signal was set at 980 MHz or a submultiple of it. Fiber optics offers some significant advantages in view of the SPS application. Optical transmission is highly immume to EMI/RFI, which is expected to be severe when considering the low distribution power. In addition, there will be savings in both mass, physical size, and potentially in cost. T.M.

IONOSPHERIC EFFECTS IN ACTIVE RETRODIRECTIVE ARRAY AND MITIGATING SYSTEM DESIGN

A. K. Nandi and C. Y. Tomita *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 p 115-125 refs (For primary document see N82-12538 03-44)

Avail: NTIS HC A99/MF A01 CSCL 10A

The operation of an active retrodirective array (ARA) in an ionospheric environment (that is either stationary or slowly-varying) was examined. The restrictions imposed on the pilot-signal structure as a result of such operation are analyzed. A 3-tone pilot beam system is defined which first estimates the total electron content along paths of interest and then utilizes this information to aid the phase conjugator so that correct beam pointing can be achieved. T.M.

HIGH EFFICIENCY SPS KLYSTRON DESIGN

Ervin J. Nalos *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 p 127-136 (For primary document see N82-12538 03-44)

Avail: NTIS HC A99/MF A01 CSCL 10A

The most likely compact configuration to realize both high efficiency and high gain is a 5-6 cavity design focused by an electromagnet. An outline of a potential klystron configuration is given. The selected power output of 70 kW CW resulted from a maximum assumed operating voltage of 40 kV. The basic klystron efficiency cannot be expected to exceed 70-75% without collector depression. Although impressive gains were achieved in raising the basic efficiency from 50% to 70% or so with a multi-stage collector, the estimated efficiency improvement due to 5-stage collector at the 75% level is only about 8% resulting in an overall efficiency of about 83%. T.M.

ANALYTIC INVESTIGATION OF EFFICIENCY AND PERFORMANCE LIMITS IN KLYSTRON AMPLIFIERS USING MULTIDIMENSIONAL COMPUTER PROGRAMS; MULTISTAGE DEPRESSED COLLECTORS; AND THERMIONIC CATHODE LIFE STUDIES

H. G. Kosmahl *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 p 139-146 refs (For primary document see N82-12538 03-44)

Avail: NTIS HC A99/MF A01 CSCL 10A

Due to complexity of the program which used a hydrodynamic, axially and radially deformable disk-ring model and the resulting long computing time only the output gap was investigated. Results from independent studies were used to initiate the starting conditions for the electrons and the RF voltage using our program. Although this method of computation is less exact than processing the entire klystron interaction in 3-Dimensions it is shown that, for a confined flow focused throughout the penultimate cavity, radial velocities remain very small and the beam is highly laminar. It is concluded that possible errors resulting from treating only the output cavity in 3-D would remain small. T.M.

SPS ANTENNA ELEMENT EVALUATION

C. D. Lunden, W. W. Lund, and Ervin J. Nalos *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 158-165 (For primary document see N82-12538 03-44)

Avail: NTIS HC A99/MF A01 CSCL 10A

The SPS transmitting array requires an architecture which will provide a low weight, high efficiency and high structural rigidity. Waveguide slot arrays constitute the most desirable option. Consequently, such an array was chosen for the SPS. Waveguide slot arrays offer high efficiency, uniform illimination, and are fairly lightweight. Bandwidths of such arrays are narrow, typically 1/2-2%. Although this does not directly impact the SPS, which transmits power at a single frequency of 2.45 GHz, the narrow bandwidth does constrain the thermal and mechanical tolerances of the antenna. The purpose of this program is to better define the electronic aspects of an SPS specific waveguide slot array. The specific aims of the program are as follows: (1) To build a full-scale half-module, 10 stick, array, the design parameters for which are to be determined analytical considerations tempered by experimental data on a single slotted radiating stick, (2) To experimentally evaluate the completed array with respect to antenna pattern, impedance and return loss; and (3) To measure swept transmission amplitude and phase to provide a data base for design of a receiving antenna. THE RESONANT CAVITY RADIATOR (RCR)

K. G. Schroeder, R. L. Carlise, and C. Y. Tomita *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 p 167-177 (For primary document see N82-12538 03-44)

Avail: NTIS HC A99/MF A01 CSCL 10A

The fundamental theory of MW antenna operation and basic array technology development status was used in the design of the 1-km diameter 5-Gw SPS microwave antenna. However, the aperture size and the high efficiency requirements make the MW antenna extremely complex. Studies show that the slotted waveguide array is one of the most efficient radiators for the antenna. Subsequent analyses show that the temperature interface between waveguides and dc-RF conversion tubes can cause severe thermal design problems on the array. An alternate design, the Resonant Cavity Radiator, is described here. L.F.M.

CONSIDERATIONS FOR HIGH ACCURACY RADIATION EFFICIENCY MEASUREMENTS FOR THE SOLAR POWER SATELLITE (SPS) SUBARRAYS

D. J. Kozakoff, J. M. Schuchardt, and C. E. Ryan *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 p 191-200 refs (For primary document see N82-12538 03-44)
(Contract NAS8-33605)
Avail: NTIS HC A99/MF A01 CSCL 10A

The relatively large apertures to be used in SPS, small half-power beamwidths, and the desire to accurately quantify antenna performance dictate the requirement for specialized measurements techniques. Objectives include the following: (1) For 10-meter square subarray panels, quantify considerations for measuring power in the transmit beam and radiation efficiency to + or - 1 percent (+ or - 0.04 dB) accuracy. (2) Evaluate measurement performance potential of far-field elevated and ground reflection ranges and near-field techniques. (3) Identify the state-of-the-art of critical components and/or unique facilities required. (4) Perform relative cost, complexity and performance tradeoffs for techniques capable of achieving accuracy objectives. the precision required by the techniques discussed below are not obtained by current methods which are capable of + or - 10 percent (+ or - dB) performance. In virtually every area associated with these planned measurements, advances in state-of-the-art are required. L.F.M.

RECTENNA ARRAY MEASUREMENT RESULTS

Richard M. Dickinson *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 p 244-250 refs (For primary document see N82-12538 03-44)
Avail: NTIS HC A99/MF A01 CSCL 10A

The measured performance characteristics of a rectenna array are reviewed and compared to the perfformance of a single element. It is shown that the performance may be extrapolated from the individual element to that of the collection of elements. Techniques for current and voltage combining were demonstrated. The array performance as a function of various operating parameters is characterized and techniques for overvoltage protection and automatic fault clearing in the array demonstrated. A method for detecting failed elements also exists. Instrumentation for deriving performance effectiveness is described. Measured harmonic radiation patterns and fundamental frequency scattered patterns for a low level illumination rectenna array are presented. Author

SESSION ON SOLID STATE: INTRODUCTION

In its Workshop on Microwave Power Transmission and Reception 1980 p 253-257 (For primary document see N82-12538 03-44)
Avail: NTIS HC A99/MF A01 CSCL 10A

The possibilities of using solid state devices as part of the Satellite Solar Power System are discussed. Solid state advantages and disadvantages are presented along with two potential concepts for use of solid state in the system design. L.F.M.

N82-12566*# Boeing Aerospace Co., Seattle, Wash.
MODIFIED REFERENCE SPS WITH SOLID STATE TRANSMITTING ANTENNA
G. R. Woodcock and B. R. Sperber *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 p 258-267 (For primary document see N82-12538 03-44)
Avail: NTIS HC A99/MF A01 CSCL 10A

The motivations for considering solid state microwave power amplifiers for the solar power satellite transmitting antenna are the possibilities of greatly increased system reliability due to elimination of electron tube cathodes, a lower mass per unit power and transmitting array area due to the high power densities obtainable in semiconductors, and, probably, cost savings due to development of small hardware items that can be handled by individuals instead of organizations. In order to provide a fair assessment where we stand today with regard to solid state SPS technology, the design described here is close to that of the NASA/DOE reference and is implemented using today's solid state technology with only a small 'push'. The small push is raising the efficiency of DC-RF conversion from the .68 obtained by RCA in 1975 to somewhat over .8 of the solid state SPS. This is generally considered feasible by semiconductor industry representatives. Other solid state SPS configurations can yield somewhat better performance. However, these generally do not provide as fair a vehicle for comparison with the reference and usually also incorporate somewhat more advanced technologies. L.F.M.

SPS SOLID STATE ANTENNA POWER COMBINER
G. W. Fitzsimmons *In* NASA. Johnson Space Center Workshop on Microwave Power Transmission and Reception 1980 p 268-277 (For primary document see N82-12538 03-44)
Avail: NTIS HC A99/MF A01 CSCL 10A

Solid state dc-rf converters offer potential improvements in reliability, mass and low voltage operation, provided that anticipated efficiencies in excess of 80 percent can be realized. Field effect transistors offer the greatest potential in the SPS frequency band at 2.45 GHz. To implement this approach it is essential that means be found to sum the power of many relatively low power solid state sources in a low-loss manner, and that means be provided to properly control the phase of the outputs of the large number of solid state sources required. To avoid the power combining losses associated with circuit hybrids it was proposed that the power from multiple solid state amplifiers be combined by direct coupling of each amplifier's output to the radiating antenna structure. The selected power-combining antenna consists of a unique printed (metalized) microstrip circuit on a ceramic type dielectric substrate which is backed by a shallow lightweight aluminum cavity which sums the power of four microwave sources. The antenna behaves like two one-half wavelength slot-line antennas coupled together via their common cavity structure. L.F.M.

LOW NO SUB X HEAVY FUEL COMBUSTOR CONCEPT PROGRAM Final Report, 23 Oct. 1979 - Jul. 1981
Paul Russell, George Beal, and Bruce Hinton 15 Oct. 1981 99 p refs Prepared in cooperation with Pratt and Whitney Aircraft, East Hartford, Conn.
(Contracts DEN3-149; DE-AI01-77ET-13111)
(NASA-CR-165512; DOE/NASA/0149-1; QTR-3236) Avail: NTIS HC A05/MF A01 CSCL 10B

A gas turbine technology program to improve and optimize the staged rich lean low NOx combustor concept is described. Subscale combustor tests to develop the design information for optimization of the fuel preparation, rich burn, quick air quench, and lean-burn steps of the combustion process were run. The program provides information for the design of high pressure full scale gas turbine combustors capable of providing environmentally clean combustion of minimally porcessed and synthetic fuels. It is concluded that liquid fuel atomization and mixing, rich zone stoichiometry, rich zone liner cooling, rich zone residence time, and quench zone stoichiometry are important considerations in the design and scale up of the rich lean combustor. (Contracts DEN3-176; DE-AI03-80ET-17088)
(NASA-CR-165519; DOE/NASA/0176-81/4; QR-7) Avail: NTIS HC A03/MF A01 CSCL 10A

A number of electrocatalyst combinations were prepared and

characterized. These electrocatalysts were formulated to contain platinum combined with transition metal carbide forming elements (W, Mo, V) for cathodes and platinum combined with palladium for anodes. High resolution electron microscopy was used to determine the crystallite size and dispersion of platinum-palladium alloy electrocatalysts in order to provide analytical support for the electrochemical determinations of the particle dispersions. An equation was derived which correlates palladium crystallite size with electrochemical hydrogen adsorption. Based on comparisons of electrocatalyst performances in the presence of pure hydrogen and hydrogen containing carbon monoxide, it was shown that the apparent poisoning of the electrocatalyst by carbon monoxide is influenced by the electrode structure.

IMPEDANCE AND MASS TRANSPORT KINETICS OF NICKEL CADMIUM CELLS

Albert H. Zimmerman and Melanie C. Janecki 1 Sep. 1981 28 p refs
(Contract F04701-80-C-0081)
(AD-A105320; TR-0081(6970-01)-1; SD-TR-81-63) Avail: NTIS HC A03/MF A01 CSCL 10/3

The impedance of operating NiCd cells in the frequency range 0.001 to 100 Hz is characteristic of mass-transport processes that occur in the cells. Two diffusion processes are observed in the impedance spectrum, at least one of which appears to involve solid-state diffusion in a surface film. The diffusion characteristics have a pronounced dependence on cell current, as well as some dependence on cell state of charge and operating temperature. The diffusion properties of the NiCd cell do appear to be sensitive to the changes in morphological or chemical structure of the active materials that can occur during use.

MODELS FOR FORECASTING ENERGY USE IN THE US FARM SECTOR Final Report

L. R. Christensen Electric Power Research Inst. Jul. 1981 200 p refs Sponsored by Electric Power Research Inst.
(EPRI Proj. 682-1)
(DE81-904220; EPRI-EA-1956-Vol-1) Avail: NTIS HC A09/MF A01

Econometric models were developed and estimated for the purpose of forecasting electricity and petroleum demand in US agriculture. A structural approach is pursued which takes account of the fact that the quantity demanded of any one input is a decision made in conjunction with other input decisions. Three different functional forms of varying degrees of complexity are specified for the structural cost function, which describes the cost of production as a function of the level of output and factor prices. Demand for materials (all purchased inputs) is derived from these models. A separate model which break this demand up into demand for the four components of materials is used to produce forecasts of electricity and petroleum is a stepwise manner. DOE

N82-12581# Merix Corp., Wellesley, Mass.

ENERGY CONSERVATION IN DISTILLATION Final Report

T. W. Mix, J. S. Dweck, M. Weinberg, and R. C. Armstrong Jul. 1981 299 p refs
(Contract DE-AC07-76CS-40259)
(DE81-028650; DOE/CS-40259/1) Avail: NTIS HC A13/MF A01

An audit of major industrial and processes and key colums in each major process indicated that approximately twoquads of energy were consumed for distillation in the US in 1976. Energy usage by industry is included: petroleum refineries, 66% chemical (including petrochemical) industry, 29% natural gas liquids processing, 5%. Techniques and current practices for conserving distillation energy are reviewed, and guidelines indicating those process conditions which favor the use of each energy conserving technique are enumerated. Expressions for payout time for tray and control retrofit options are developed based on energy savings and increased throughput. Calculations for industrial colums suggested that both types of retrofits would frequently have short (.6 months) payout times based on either criterion. Extractive distillation is also discussed, and criteria enabling the estimation of the energy which may be conserved using this technique are developed. Good housekeeping practices and field techniques for checking the energy efficiency of industrial distillations are also discussed. DOE

Life testing of palladium-loaded and low platinum-loaded anodes on type C supports and with type no. 01 current collectors was continued and terminated. Additional life-test data are reported for high Pt-loaded and a second low Pt-loaded anode. The 6 in. x 6 in. depth cell was operated at reduced hydrogen back pressures, and the effect of the resulting flooding of the hydrogen chamber upon cell performance was determined. Furthermore, two 6 in. x 6 in. depth cells were fabricated from the same type platinum support and current collector, but following different preparation procedures. Cell performance was compared at various submergence depths under identical operating conditions. DOE

THE SEVERITY OF INSTITUTIONAL BARRIERS AFFECTING ENERGY-FROM-MUNICIPAL-WASTE TECHNOLOGIES
G. E. Dials, J. M. Greenwood, L. L. Lewis, and E. M. Cole Jun. 1981 58 p refs Presented at Inst. Barriers Assessment Workshop, Washington, D.C., 19 Feb. 1981 Prepared for Argonne National Lab., Ill.
(Contract W-31-109-eng-38)
(DE82-000133; ANL/CNSV-TM-79) Avail: NTIS HC A04/MF A01

The results from a workshop during which EMW experts were asked to indicate the importance of these barriers are summarized. The basic results of the workshop participants' scoring of the institutional barriers according to their importance are described. More elaborate analyses conducted on the workshop results are reported. A summary of the workshop results and a listing of the most important EMW technology/institutional barrier combinations are included. T.M.

EVALUATION OF LANDFILL GAS AS AN ENERGY SOURCE
Dec. 1980 45 p refs
(Contract DE-FG02-78IR-05106)
(DE82-000116; DOE/IR-05106/T47) Avail: NTIS HC A03/MF A01

The benefits and problems associated with landfill gas recovery were considered by the City of Baltimore, resulting in the structuring and testing of a realistic gas recovery evaluation procedure for use by local governments. The Baltimore methodology is summarized and results of its application to a large landfill in the Baltimore area are presented. The landfill gas generation process potential uses for the recovered gas, and treatment requirements are covered. DOE

UNITED STATES DEPARTMENT OF ENERGY THERMAL STORAGE PROGRAM
J. H. Swisher (DOE, Washington, D.C.) and W. A. Frier 1981 36 p refs
(Contracts DE-AI01-78CS-35217; DE-AC06-76RL-C1830; EM-78-1-01-5217)
(DE81-030263; DOE/RL-01830/T6) Avail: NTIS HC A03/MF A01

Thermal energy storage devices, processes, and subsystems that permit domestic energy resources to be supplied at the time and locations where they can be used are developed. Daily storage for active or passive solar and conventional heating and cooling, seasonal storage for building heating and cooling, thermal energy transport, thermal power storage, and chemical heat pumps are emphasized. DOE

N82-12586# Battelle Pacific Northwest Labs., Richland, Wash.
BIBLIOGRAPHY OF THE SEASONAL THERMAL ENERGY STORAGE LIBRARY
L. S. Prater, G. Casper (Midwest Research Inst.), and R. A. Kawin (Control Data Corp.) Aug. 1981 310 p
(Contract DE-AC06-76RL-01830)
(DE81-030470; PNL-3645) Avail: NTIS HC A14/MF A01

Seasonal storage of thermal energy which contributes to the relief of the national energy storage is described. Various forms of surplus energy (winter chill, summer heat, and industrial waste heat) are stored till needed. Potential storage media include: aquifers, lakes, ponds, and earth. Storage of thermal energy in aquifers is chosen for initial development. Other methods of seasonal storage are also evaluated. DOE

ASSESSMENT OF THE POTENTIAL OF COAL-FUELED HEAT ENGINES IN TOTAL AND INTEGRATED ENERGY SYSTEMS
J. C. Bratis, M. L. Jain, and T. J. Marciniak Jun. 1981 80 p refs
(Contract W-31-109-eng-38)
(DE82-000169; ANL/FE-81-56) Avail: NTIS HC A05/MF A01

The potential of several prime movers, especially those that use coal, for use in total and integrated energy systems in the residential and commercial sector was investigated. The prime movers considered are diesels, Stirlings, internally and externally fired gas turbines, and steam turbines. Total energy systems based on the prime movers are compared to the conventional system for four communities that represent different ratios of residential to commercial area. The energy savings, environmental effects, and economic benefits are shown. It is found that for both scenarios, neither coal nor oil using total energy systems have a definite economic advantage. DOE

DETECTING OUTLIERS IN ENERGY TIME-SERIES DATA
Michael R. Chernick (Aerospace Corp., Los Angeles), Darryl J. Downing, and David H. Pike Aug. 1981 43 p refs
(DE81-030230; ORNL/TM-7460) Avail: NTIS HC A03/MF A01

Occasional large errors in energy data can have drastic effects on estimates for such quantities as correlation coefficients, regression coefficients, and spectral density estimates. The effect of outliers on time series was investigated by considering the influence function for the autocorrelations p(k) of a stationary time series. Effects on estimates of the spectrum for power plant data are then shown. Finally, asymptotic theory was derived for the maximum average square influence function in order to formally test for outliers in stationary Gaussian sequences. DOE

NATIONAL INTERIM ENERGY-CONSUMPTION SURVEY: EXPLORING THE VARIABILITY IN ENERGY CONSUMPTION
Robert Latta, Thomas H. Woteki, Lynda Carlson, Wendel Thompson, and Kenneth Vagts Jul. 1981 70 p refs
(DE81-029910; DOE/EIA-0272) Avail: NTIS HC A04/MF A01

The variation in total energy consumption and consumption by end use are described. The report concentrates on regression models for describing the variability in natural gas and electricity consumption for households living in single family detached houses. Sample data and the subsets used in the analyses are described. A theoretical model for describing a household's energy consumption is presented. Graphical summaries of the data which serve to explain the specific models fit to the data are also presented. The empirical models fit to the data, and the method of fitting, are discussed. Results, speculation on interpretation of the model coefficients, and potential uses of the model are summarized. DOE

VERTICAL-AXIS WIND-TURBINE CONTROL STRATEGY

Gerald M. McNerney Aug. 1981 21 p refs
(Contract DE-AC04-76DP-00789)
(DE81-031932; SAND-81-1156) Avail: NTIS
HC A02/MF A01

Early expense in automatic operation of the Sandia 17-m vertical axis research wind turbine (VAWT) demonstrated the need for a systematic study of control algorithms. To this end, a computer model was developed that uses actual wind time series and turbine performance data to calculate the power produced by the Sandia 17-m VAWT operating in automatic control. The model was used to investigate the influence of starting algorithms on annual energy production. The results indicate that, depending on turbine and local wind characteristics, a bad choice of a control algorithm can significantly reduce overall energy production. The model can be used to select control algorithms and threshold parameters that maximize long-term energy production. DOE

UTILIZATION OF WASTE HEAT FROM MAJOR TRANSFORMER SUBSTATIONS. VOLUME 1: GENERIC STUDY Final Report

N. T. Christensen Aug. 1981 190 p refs Sponsored by Electric Power Research Inst. 2 Vol.
(EPRI Proj. 1274-1)
(DE81-904212; EPRI-EM-1968-Vol-1) Avail: NTIS
HC A09/MF A01

Large substation transformers reject substantial thermal energy. Since these units are usually close-coupled to facilities requiring low-temperature thermal energy for space conditioning, the ability to recover and efficiently utilize this energy is of significant interest. The intent of this project was to analytically evaluate the technical and economic potential of transformer waste heat recovery and utilization and verify the analysis with subscale testing. A general system was designed and optimized for the recovery of transformer waste heat. Simplified analytical techniques were developed to assist utilities in both preliminary analysis and detail design analysis of specific systems, including system economics. Critical component performance parameters were identified for the preparation of detailed specifications. Criteria was established for the specific application of such systems through system economics. A national mail survey was conducted to determine the quantity and usability of transformer waste heat in the United States. DOE

N82-12594# Rocket Research Corp., Redmond, Wash.

UTILIZATION OF WASTE HEAT FROM MAJOR TRANSFORMER SUBSTATIONS. VOLUME 2: SITE-SPECIFIC STUDY Final Report

N. T. Christensen Aug. 1981 93 p Sponsored by Electric Power Research Inst. 2 Vol.
(EPRI Proj. 1274-1)
(DE81-904236; EPRI-EM-1968-Vol-2) Avail: NTIS
HC A05/MF A01

The applicability of transformer waste heat utilization was examined by analyzing a site-specific application. The site is located in Seattle, Washington; the energy source is the Broad Street Substation and the energy user is the Pacific Science Center. A description of the system is presented in Section I. A preliminary heat source/heat service analysis is given in Section II. Transformer waste heat availability and system heat demand, the thermal performance and hydraulic analysis, overall system efficiency, operation flexibility, major component selection, and the thermal storage system are discussed. The substation site, the transmission system, and the retrofit of the Pacific Science Center are described. System cost details and a cash flow projection are given. DOE

ENERGY RECOVERY FROM MUNICIPAL SOLID WASTE AND SEWAGE SLUDGE USING MULTI-SOLID FLUIDIZED BED COMBUSTION TECHNOLOGY

Jul. 1981 210 p refs
(Contract DE-AC01-78CS-20424)
(DE82-001142; DOE/CS-20424/1) Avail: NTIS
HC A10/MF A01

The concept is to recover energy as high and low pressure steam, simultaneously. High pressure steam would be generated from flue gas using a conentional tubular boiler. Low pressure steam would be generated by direct contact drying of DSS (as 4 percent solids) with hot sand in a fluidized bed that is an integral part of the MS-FBC process. It is proposed that high pressure steam could be used for district heating or electricity generation. The low pressure steam could be used for close proximity building heat. The results of the investigation show that the MS-FBC process concept for the co-utilization of MSW and DSS is technically feasible and that the thermal efficiency of the process is 76 to 82 percent based on experiments conducted in a 70 to 85 lb/h pilot plant and calculations on three conceptual cases. OPTIMIZATION OF SOLAR HEATING AND COOLING SYSTEMS
T. L. Freeman (Atlas Corp., Santa Cruz, Calif.) Jun. 1981 56 p refs
(NP-1903997) Avail: NTIS (US Sales Only) HC A04/MF A01; DOE Depository Libraries

A review of general techniques and specific methods useful in the optimization of solar heating and cooling systems is undertaken. A discussion of the state of the art and the principal problems in both the simplified thermal performance analysis and economic analysis portions of the optimization problem are presented. Sample economic analyses are performed using several widely used economic criteria. The predicted thermal results of one typical, widely used simplified method is compared to detailed simulation results. A methodology for and the results of a sensitivity study of key economic parameters in the life cycle cost method are presented. Finally, a simple graphical optimization technique based on the life cycle cost method is proposed. DOE

COMPARATIVE ECONOMIC PERFORMANCE OF SELECTED PASSIVE SOLAR HEATING AND COOLING TECHNOLOGIES
W. Rutter May 1981 24 p refs
(Contract DE-AC02-76CH-00016)
(DE81-030220; BNL-51394) Avail: NTIS HC A02/MF A01

The economic performance of selected passive solar heating and cooling technologies which incorporate energy storage is assessed by using a set of uniform assumptions and methodologies. Where data are available, a given system is assessed at more than one geographical location. Results are obtained in the form of both payback period and net present value for residential applications, and in terms of net present value only for industrial/commercial uses. Results indicate that ventilated trombe walls, solar roof ponds, and certain night effect/floor storage strategies are cost effective, but night effect/rock bed cooling is not. Results also show that, although direct gain out-performs trombe walls in most parts of the country, both direct gain and trombe walls usually produce a net savings in the residential sector. Generally, however, tax regulations result in net economic loss for direct gain and trombe walls used to heat industrial and commercial buildings. DOE

N82-12601# Sandia Labs., Albuquerque, N. Mex. Thermal Sciences Div.
COMPARATIVE ECONOMICS OF SOLAR THERMAL CENTRAL RECEIVERS
Miriam J. Fish Aug. 1981 56 p refs
(Contract DE-AC04-76DP-00789)
(DE81-029623; SAND-81-8236) Avail: NTIS HC A04/MF A01

For both electrical and industrial process heat (IPH) generation, central receivers compare favorably with oil and gas, and in many cases, coal. Calculational results are presented in which the levelized energy costs from central receiver plants are compared with those from oil, gas, and coal fired plants. Both electrical and IPH applications are discussed. Uncertainties in future capital costs, fuel price escalation rates, and the underlying economic climate are included in the analysis. DOE

TECHNOLOGY ASSESSMENT OF SOLAR ENERGY SYSTEMS: RESIDENTIAL USE OF FUELWOOD IN THE PACIFIC NORTHWEST
P. N. Petty and W. J. Hopp Aug. 1981 72 p refs
(Contract DE-AC06-76RL-01830)
(DE82-000046; PNL-3918) Avail: NTIS HC A04/MF A01

The evidence of impacts associated with the use of fuelwood for residential space heating in the region including the states of Washington, Oregon, and Idaho is identified and evaluated. The use of fuelwood for space heating was projected into the future, and then the potential size of the impacts that had been identified and estimated was evaluated. These projections are provided in five year increments beginning in 1980 and proceeding to the year 2000. Policy options are suggested which may mitigate the adverse impacts identified, while preserving the positive effect of reducing residential demand for energy derived from nonrenewable sources. DOE

N82-12604# Mid-American Solar Energy Complex, Minneapolis, Minn.
WOOD RESOURCES AND UTILIZATION PATTERNS IN THE NORTH CENTRAL REGION AND ENERGY NEEDS FOR THE MANUFACTURE OF WOOD PRODUCTS
Steven A. Sinclair Mar. 1981 37 p refs
(Contract DE-AC02-79-CS-30150)
(DE81-030356; MASEC/R-81-005) Avail: NTIS HC A03/MF A01

The resources of the region are discussed on a state-by-state basis. The discussion of standing timber growth and removal is in terms of commercial growing stock; however, the total forest biomass may be estimated by simply adding the potential logging residue to the growing stock figure. The energy needs of various wood and paper products, plants, standard industrial classification codes 24 and 26, are highlighted. In addition, the ability of various wood manufacturing facilities to generate their energy needs from wood residues and by-products is explored. T.M.

N82-12605# United Technologies Corp., South Windsor, Conn.
DESIGN, CONSTRUCTION, AND OPERATION OF A FULL SCALE EXPERIMENTAL ANAEROBIC FERMENTATION FACILITY Final Report
Jun. 1981 235 p
(Contract DE-AC01-77ET-20009)
(DE81-029028; DOE/ET-20009/T1) Avail: NTIS HC A11/MF A01

A 25 ton per day anaerobic fermentation facility was designed to evaluate the technical and economic viability of producing fuel gas and an animal refeed product from the residues of an environmental beef cattle feedlot. The system has been in continuous operation and has been producing between 3 to 5 cubic feet of methane per pound of volatile solids fed to the system. Product gas is successfully utilized in: (1) the system process boiler which maintains thermophilic operating temperature in the fermentors; (2) a meat packing plant process boiler, cofired with fuel oil; (3) and a 440 kW grid connected engine/generator system. Feeding trials that will establish the value of the dewatered effluent were performed. It is indicated from the initial operation of the system that it will be a technically and economically viable process. DOE

TECHNOLOGY ASSESSMENT OF SOLAR ENERGY SYSTEMS: POTENTIAL SOIL EROSION EFFECTS OF HARVESTING CROP RESIDUES FOR ENERGY PRODUCTION
Michael F. Torpy, Loren J. Habegger, Mary A. Snider, and Terrence G. Surles Jan. 1981 38 p refs
(Contract W-31-109-eng-38)
(DE82-000149; ANL/EES-TM-152) Avail: NTIS HC A03/MF A01

An evaluation is presented of the potential increase in erosion that could result from removal of the ground cover that the residues provide. The study indicates that removal of crop residues sufficient to produce 0.13 and 0.42 x 10 to the 15th power Btu of end-use energy (as specified, respectively, in the two scenarios addressed by the Technology Assessment of Solar Energy Program) would have little effect on soil erosion except in a few areas. An alternative scenario is addressed in which all reasonably available crop residues would be harvested to produce 1.5 x 10 to the 15th power Btu of end-use energy. The approach used in evaluating erosion due to removal of residue is also described. DOE

PHOTOVOLTAIC MARKET ANALYSIS PROGRAM: BACKGROUND, MODEL DEVELOPMENT, APPLICATIONS AND EXTENSIONS
Gary L. Lilien and Frank H. Fuller Apr. 1981 158 p refs
(Contract DE-AM01-76EI-02295)
(DE81-029711; MIT-EL-81-012) Avail: NTIS HC A08/MF A01

Tools and procedures to help guide government spending decisions associated with stimulating photovoltaic market penetration were developed. The program has three main components: (1) theoretical analysis aimed at understanding qualitatively what general types of policies are likely to be most cost effective in stimulating PV market penetration; (2) operational model developent (PV1), providing a user oriented tool to study quantitatively the relative effectiveness of specific government spending options and (3) field measurements, aimed at providing objective estimates of the parameters used in the diffusion model used in PV1. Existing models of solar technology diffusion are reviewed and the structure of the PV1 model is described. Theoretical results on optimal strategies for spending federal market development and subsidy funds are reviewed. The validity of these results is checked by comparing them with PV1 projections of penetration and cost forecasts for 15 government policy strategies which are simulated on the PV1 model. DOE

COST GOALS FOR A RESIDENTIAL PHOTOVOLTAIC/THERMAL LIQUID COLLECTOR SYSTEM SET IN THREE NORTHERN LOCATIONS
Thomas L. Dinwoodie and John P. Kavanaugh Oct. 1980 61 p refs
(Contract DE-AC02-76ET-20279)
(DE81-029700; MIT-EL-80-028) Avail: NTIS HC A04/MF A01

The allowable costs for a residential PV/T liquid collector system are compared with those of both PV only and side-by-side PV and thermal collector systems. Four typs of conventional energy systems provide backup: all oil, all gas, all electric resistance, and electric resistance hot water with space heating by parallel heat pump. Electric space cooling is modeled, and the electric utility serves as backup for all electrical needs. The analysis is separated into two parts: (1) a base case study using conservative market and financial parameters for comparing PV/T economics in three northern locations; and (2) the sensitivity of PV/T economics to pertinent physical, market, and financial variables is examined. The difference in economic outlook for PV/T in retrofit applications is also estimated. It is indicated that, it for northern locations modeled, is less than that of separate (side-by-side) collector systems, at total array areas between 40-80 sq m. Below this range, allowable costs diverge, benefiting optimally sized separate collector systems. DOE

NEAR-TERM IMPROVEMENTS IN PARABOLIC TROUGHS: AN ECONOMIC AND PERFORMANCE ASSESSMENT
R. Gee and L. M. Murphy Aug. 1981 54 p refs
(Contract DE-AC02-77CH-00178)
(DE82-001158; SERI/TR-632-870) Avail: NTIS
HC A04/MF A01

Improved parabolic trough concentrating collectors which result from better design, improved fabrication techniques, and the development and utilization of improved materials are analyzed. The improvements considered are evacuated receivers, silvered glass reflectors, improved receiver, selective coatings, higher optical accuracy concentrations, and higher transmittance receiver glazings. Upper bound costs for each improvement are provided as well as estimates of the increased solar system rates of return that are made possible by these improvements. It is shown that the performance and economic potential of these improvements are substantial, especially at higher collector operating temperatures. DOE

USER'S GUIDE TO HELIOS: A COMPUTER PROGRAM FOR MODELING THE OPTICAL BEHAVIOR OF REFLECTING SOLAR CONCENTRATORS. PART 1: INTRODUCTION AND CODE INPUT
C. N. Vittitoe and Frank Biggs Aug. 1981 64 p refs
(Contract DE-AC04-76DP-00789)
(DE81-031920; SAND-81-1180-Pt-1) Avail: NTIS
HC A04/MF A01

HELIOS is a flexible computer code for evaluating designs for central receiver, parabolic dish, and other reflecting solar energy collector systems, for safety calculations on the threat to personnel and to the facility itself, for determination of how various input parameters alter the power collected, for design trade offs, and for heliostat evaluations. Input variables include atmospheric transmission effects, reflector shape and surface errors, suntracking errors, focusing and alignment strategies, receiver design, placement positions of the tower and mirrors, and time of day and day of the year for the calculation. Complete input instructions and a description of the code structure are given. DOE

SOLAR THERMAL CENTRAL RECEIVERS FOR INDUSTRIAL PROCESS HEAT GENERATION: USER VIEWS AND RECOMMENDATIONS FOR COMMERCIALIZATION
M. J. Fish Aug. 1981 66 p refs
(Contract DE-AC04-76DP-00789)
(DE81-029611; SAND-81-8235) Avail: NTIS
HC A04/MF A01

Results of recent meetings with several private industrial groups in which solar thermal central receivers were discussed in depth as a potential for industrial process heat generation are summarized. Topics covering potential economics, technical requirements, and actions to promote commercialization of the technology are presented. These findings are then translated into recommendations for commercialization in private industrial markets. Key points include the need for small scale systems integration projects in addition to the 10 MW/sub e/ plant under construction at Barstow, CA, and the adoption of financial incentives, such as tax credits, for getting the early commercial plants built. PRODUCTION OF AMMONIA IN A PACKED-BED, ANAEROBIC UPFLOW (ANFLOW) BIOREACTOR M.S. Thesis - Tennessee Univ.
D. C. M. Hines Aug. 1981 101 p refs
(Contract W-7405-eng-26)
(DE81-030699; ORNL/TM-7622) Avail: NTIS
HC A06/MF A01

The objective of this study was to monitor effluent ammonia concentrations and ammonia production rates within the ANFLOW bioreactor as influent soluble chemical oxygen demand (SCOD) concentrations and flow rates were varied. Correlations between influent organic loadings and effluent ammonia concentrations and ammonia formation were sought. Subsequent ammonia removal methods are proposed. A packed-bed, aerobic upflow bioreactor was tested for nitrification of effluent ammonia for the ANFLOW bioreactor. Removal rates of SCOD ranged from 87 to 95 percent within ANFLOW bioreactor. The most efficient SCOD removal occurred at the highest organic loading rate (OLR). Profiles of SCOD and volatile acids concentrations showed distinct regions of complex organics breakdown and wastes stabilization. DOE

INTERACTIVE MODEL TO ASSESS ECONOMICS OF ANAEROBIC DIGESTION OF THE FARM
Aug. 1981 41 p
(Contract DE-AC02-79CS-30150)
(DE82-000452; MASEC/R-81-068) Avail: NTIS
HC A03/MF A01

An interactive computer model, to provide economic assessment for on the farm anaerobic digestion systems was designed. The model is accessed as part of the MASEC Models Library. It consists of two phases: engineering analysis and economic analysis. User inputs are stored in a data base and may be retained for future use. Model outputs include a recap of user inputs, calculations for gas production, digester heat requirements, system revenues, yearly cash flow, and a graph of the net present value of the investment. The model is generalized so that nonfarm applications may also be analyzed. The program will work equally well for various digester designs such as continuously stirred reactors, plug flow systems, and fluidized bed columns. DOE

FLEXIBILITIES IN PASSIVE DESIGN: EXAMINING SOME LIMITING SOLAR MYTHS
R. G. Derickson and K. S. Sadlon Jul. 1981 5 p refs Presented at 6th Natl. Passive Conf., Portland, Oreg., 8 Sep. 1981
(Contract DE-AC02-77CH-00178)
(DE81-028401; SERI/TP-721-1342; CONF-810925-15) Avail: NTIS HC A02/MF A01

Frequently cited rules-of-thumb or general guidelines that needlessly limit designer choice and freedom are examined. It is found that a rectangular design with an E-W elongation is not really essential to proper passive design, east and west windows do not necessarily detract from passive heating performance or negatively impact cooling efficiency, and a passive house need not be crammed with thermal mass. Some flexible design alternatives are explored and factors other than E-W elongation, windows, and thermal mass are considered. DOE

ECONOMIC ASSESSMENT OF ADVANCED CENTRAL-RECEIVER SOLAR-THERMAL POWER SYSTEMS: EXECUTIVE SUMMARY
Oct. 1980 23 p refs
(Contract DE-AC03-79SF-10601)
(DOE/SF-10601/0) Avail: NTIS HC A02/MF A01

The value and potential electric utility impact of several advanced central receiver solar thermal plant concepts in the role of electric generating stations were estimated. Economics, the cost of producing electricity, fuels displaced, and utility system reliability are examined. The central receiver plants evaluated included solar/fossil hybrid concepts and solar stand-alone plants with thermal storage. It is indicated that if the cost goals are achieved and projected solar plant performance attained, the advanced solar thermal concepts can be competitive in regions with good insolation and some continued use of oil or other surrogate distillate or gaseous fuels. DOE

SEASONAL PERFORMANCE FACTORS FOR ACTIVE SOLAR SYSTEMS AND HEAT-PUMP SYSTEMS
R. L. Reid and L. A. Abbatiello 1981 7 p refs Presented at the IECEC Conf., Atlanta, 9 Aug. 1981
(Contract W-7405-eng-26)
(DE81-028569; CONF-810812-35) Avail: NTIS HC A02/MF A01

Methods of evaluating solar systems are discussed and compared. Heating seasonal performance factor (SPFH) and annual coefficient of performance (ACOP) are selected as being of the most vaue to the consumer in determining his purchased energy requirements and also allow the direct comparison of solar and heat pump systems. A search of the literature produced seasonal or annual data from 20 solar and 12 heat pump systems that were instrumented well enough to measure the loads and energy consumptions necessary to calculate the SPFH and/or ACOP. Tables of these results show that well-designed solar systems have SPFHs of 1.6 to 2.8 compared to heat pump SPFHs of 1.6 to 2.0. However, the heat pump Annual Cycle Energy System ACOP was measured as 3.1 compared to a projected maximum ACOP for a solar system with heat pump cooling of 2.4 to 2.8. DOE

PERFORMANCE ANALYSIS OF 11 DENVER METRO PASSIVE HOMES
D. E. Claridge Jul. 1981 7 p refs Presented at the AS/ISES 6th Natl. Passive Solar Conf., Portland, Oreg., 8-12 Sep. 1981
(Contracts DE-AC02-77CH-00178; EG-77-C-01-4042)
(DE81-025473; SERI/TP-721-1325; CONF-810925-12) Avail: NTIS HC A02/MF A01

The auxiliary heating requirements for 11 passive solar homes were calculated using SLR or SUNCAT-2.4 with a standard set of basic assumptions. It is shown that: seven of the homes should use less than half as much heating fuel as typical houses, two should use about half, and two should use about two-thirds or more. These results are compared with performance estimates and show large discrepancies. Differences are attributed largely to specific differences in assumptions in every case but one. DOE

SUMMERTIME RESULTS FROM THE CLASS B PASSIVE-SOLAR PERFORMANCE-MONITORING PROGRAM
J. Swisher Jul. 1981 3 p Presented at the 6th Natl. Passive Solar Conf., Portland, Oreg., 8-12 Sep. 1981
(Contracts DE-AC02-77CH-00178; EG-77-C-01-4042)
(DE81-025471; SERI/TP-721-1317; CONF-810925-8) Avail: NTIS HC A02/MF A01

The program is designed to provide, at relatively low cost, accurate and consistent real-time estimates of building thermal performance, as well as detailed data regarding climate, indoor temperatures, and purchased energy needs. As part of this program, a microprocessor-based data acquisition system was installed in each of ten passive solar houses in the Denver area, primarily to evaluate heating-season performance. During the summer, however, the monitoring systems are used to study the overheating tendencies of the buildings. Examination of the conditions that lead to overheating, using graphical and statistical techniques, will provide insight into the solar design practices that provide the most comfortable summer environment. DOE

PASSIVE COOLING AND HEATING PROGRAM AT OAK RIDGE NATIONAL LABORATORY FOR FY-1981

H. B. Shapira, S. I. Kaplan, and C. V. Chester 1981 11 p refs Presented at the DOE Passive and Hybrid Solar Energy Program Update, Washington, D.C., 9 Aug. 1981
(Contract W-7405-eng-26)
(DE81-028573; CONF-810832-5) Avail: NTIS HC A02/MF A01

Construction was completed of an earth-sheltered, passively solar heated office-dormitory, the Joint Institute for Heavy Ion Research, designed at ORNL. Instrumentation of the building was designed, procured, and installed. Building performance will be monitored and compared with predictions of the DOE-2 code. A study of the incorporation of vegetation on architecture was conducted by the Harvard School of Design. A final report was issued which is a prototype handbook for the use of vegetation to reduce cooling loads in structures. An experiment to reduce the cooling requirement of mobile homes by shading with fast-growing vines was begun: a maintenance-oriented trellis was constructed and vines were planted. An RFP for the production of a prototype set of reflective insulating blinds was issued. DOE

COSTS FOR ALTERNATIVE GRAIN-RESIDUE-COLLECTION SYSTEMS

Silvio J. Flaim, Bernie Neenan, Jan Dauve, and Harry P. Mapp, Jr. (Oklahoma State Univ., Stillwater) Jun. 1981 55 p refs
(Contracts DE-AC02-77CH-00178; EG-77-C-01-4042)
(DE81-029072; SERI/TR-734-900) Avail: NTIS HC A04/MF A01

The costs for systems for corn and soybean production in Iowa are examined. All machinery field operations, fuel, other inputs, and labor requirements are identified for the base case with no residue harvest, and for residue harvest by stacks and large round bales, with the owner's equipment and for custom harvest. These five cases were developed for corn and soybeans for conventional and reduced tillage practices. Harvesting alternatives are compared on the basis of costs, fuel input requirements, and gross energy balances of residues collected less energy inputs. The cost of collecting corn and soybean residues varies widely over the collection and tillage systems examined. Other effects constant, the reduced tillage practice leads to a lower cost of harvest than conventional tillage, and stacks are always cheaper than large round bales; however, the former difference is greater than the latter. DOE

INNOVATIVE EQUIPMENT FOR SMALL-SCALE HYDRO DEVELOPMENTS

J. D. Lawrence and Leslie Pereira 1981 17 p refs Presented at the Waterpower Conf., Washington, D.C., 22 Jun. 1981 Prepared in cooperation with Acres American, Inc., Buffalo, N.Y.
(Contract DE-AC07-76ID-01570)
(DE81-027820; EGG-M-03381; CONF-8106137-4) Avail: NTIS HC A02/MF A01

The feasibility of using off the shelf pumps as turbines, with induction motors as generators, and combinations of available equipment such as speed increasers, inlet valves, and gates for typical small scale hydro installations are discussed. A computer simulation model was developed in the study which provides a basis to estimate the performance of pumps in the turbine mode of operation. It is indicated that a major part of the small hydro plant potential can be economically covered by the use of pumps as turbines and induction motors as generators especially for the smaller ratings. DOE

N82-12635# Gilbert Associates, Inc., Reading, Pa.

MODULAR HYDRO DAM APPROACH TO THE ECONOMIC DEVELOPMENT OF ULTRA LOW-HEAD HYDROPOWER

K. R. Broome 1981 19 p Presented at the Hydropower Conf., Washington, D.C., 22 Jun. 1981
(Contract DE-AC07-76ID-01570)
(DE81-027817; CONF-8106137) Avail: NTIS HC A02/MF A01

The potential for developing economical new ultra low head sites using an innovative concept known as the modular hydro dam (MHD) were explored. This concept, combines the benefits of shop fabrication and installation of equipment in truck transportable, waterproof power modules, with prefabricated gate sections that can be located between the power modules. The technical, economic, environmental, and institutional feasibility of the MHD concept are examined. Capital and operating costs are estimated. It is concluded that the potential for power generation at ultralow head sites justifies the development of the MHD concept. DOE

MODELLING ENERGY-ECONOMIC INTERACTIONS IN DEVELOPING COUNTRIES: A LINEAR-PROGRAMMING APPROACH

Peter Meier and Vinod Mubayi 1981 51 p refs Presented at the 9th Intern. Conf. on Operational Res., Hamburg, 23 Jul. 1981; sponsored by International Federation of Operations Research Societies
(Contract DE-AC02-76CH-00016)
(DE81-026048; BNL-29747; CONF-810726-2) Avail: NTIS HC A04/MF A01

An energy economic assessment model for application to energy assessments in developing countries is described. A simple comprehensive treatment of the energy sector is emphasized. The input output model is directly incorporated in the Energy system LP. The major supply sectors, as well as the major energy using industries, are modelled as capacity expansion problems, in which explicit distinction is made between capital stock and energy flows. For most developing countries the notion of energy supply curves is far fetched, since energy prices are set by planning authority, not established by market clearing equilibrium. DOE

LATENT HEAT STORAGE DEVICES. PART 1: CHARACTERISTICS AND APPLICABILITY OF LATENT HEAT STORAGE DEVICES [LATENTWAERMESPEICHER, TEIL 1: EIGENSCHAFTEN UND ANWENDUNGSMOEGLICHKEITEN VON LATENTWAERMESPEICHERN]

K. Krichel Bonn Bundesministerium der Verteidigung 1979 90 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium der Verteidigung
(BMVg-FBWT-79-12-Pt-1) Avail: NTIS HC A05/MF A01; DOKZENTBw, Bonn DM 30

Significant physicochemical data (melting point, specific enthalpy of fusion, crystallization kinetics, etc.) on heat storage media and construction materials are recorded. The best storage materials are paraffins, salt hydrates, clathrates, and their mixtures in the lower temperature range (-30 to 100 C), hydroxides and halides of light metals, and their mixtures in the medium temperature range (100 to 500 C), and alkali and alkaline earth halides, especially fluorides at high temperatures (above 500 C). Adaption of different latent heat capacitor designs to operational temperature and storage material, and the relation between heat transport, heat exchanger construction and type of crystallization are discussed. Possible failures caused by unfavorable crystallization kinetics (stratification, supercooling) and measures to avoid such faults are described. Construction and insulation materials, with special emphasis on corrosion and stability, are addressed. Author (ESA)

LATENT HEAT STORAGE DEVICES. PART 2: HEAT STORAGE MEDIA, DESIGNS AND CONSTRUCTION MATERIALS FOR HEAT OF FUSION STORAGE DEVICES [LATENTWAERMESPEICHER, TEIL 2: SPEICHERMASSEN, BAUFORMEN UND WERKSTOFFE FUER SCHMELZWAERMESPEICHER]

K. Krichel Bonn Bundesministerium der Verteidigung 1979 65 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium der Verteidigung
(BMVg-FBWT-79-13-Pt-2) Avail: NTIS HC A04/MF A01; DOKZENTBw, Bonn DM 30

Because of the promising technical and operational advantages of latent heat storage, thermodynamic, kinetic and chemical properties of phase change materials are depicted. Eutectics and conguently melting compounds are the most useful substances among the potentially suitable latent heat storage materials. The operational temperature depending on the phase change material remains constant at charge and discharge. Melting is the most appropriate phase change for heat storage due to considerable heat capacities and high densities of condensed phases. Supercooling of many storage media is at present a considerable difficulty. Besides the treatment of economics, safety hazards and environmental problems and the description of some practical applications, two suggestions for military applications of latent heat storage devices are discussed. BASIS FOR RESEARCH PROPOSALS CONCERNING (INDUSTRIAL) SOLAR ENERGY PRODUCTION PROCESSES DERIVED FROM BIOLOGICAL PRINCIPLES [BASIS VOOR ONDERZOEKVOORSTELLEN BETREFFENDE (INDUSTRIEELE) ZONNE-ENERGIEWINNINGSPROCESSEN AFGELEID VAN BIOLOGISCHE PRINCIPES]

1980 96 p refs In DUTCH
Avail: NTIS HC A05/MF A01

The economic feasibility of photochemical conversion systems for solar energy production processes derived from biological principles was studied. A global energy analysis shows that the period during which a solar energy installation has to deliver energy in order to regain the energy required for the construction is about one-seventh or one-eighth of its lifetime (10 times longer than conventional installations). Energy production with the help of photocatalytic systems in western Europe is only economical if the net conversion efficiency is substantially increased above 15%. Complex photocatalytic processes or combined photoelectric, photochemical and thermal mechanisms may be applied, i.e., coproduction, combining a photovoltaic or photocatalytic process with solar heat production or combining several photocatalytic systems. A tentative evaluation of conversion processes for solar energy is presented. Author (ESA)

FUEL SAVINGS IN HOT WATER HEATING PLANTS BY APPLICATION OF HEAT PUMPS OPERATED WITH NATURAL GAS (NATURAL GAS HEAT PUMP). PROJECT: GAS ENGINE Final Report

Klaus Wissler Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 61 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-80-125; ISSN-0340-7608) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 11,60

Energy consumption in residential heating using a heat pump driven by an internal combustion engine is discussed. A natural gas rotary engine was developed as a drive unit for a heat pump with 120 to 150 kW heating capacity. The engine was derived from an automotive prototype engine; it had an output of 50 kW at 6000 rpm. The efficiency was improved by an increased compression ratio and a rotor recess suitable for natural gas operation. The engine used specially developed spark plugs and high performance lubrication oil. To obtain longevity, the trochoid surface and the side housing surface were coated with a plasma spray wear coating, ceramic apex seals were used and the accessories were redesigned. Author (ESA)

IMPROVEMENT OF THERMAL EFFICIENCY OF FLAT PLATE SOLAR COLLECTORS Final Report

Hubert Boeck, Reinhard Hallermayer, Wolfgang Schoelkopf, and Alfred Wiesmeth Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 62 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-80-194; ISSN-0340-7608) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 13

Measuring methods (spectral resolution of absorptivity and the evaluation of overall absorptivity with a solar spectrum) and further developed (calorimetric device to measure the hemispherical thermal emissivity of various speciments) were examined. The convective heat transfer between cover and absorber of a flat plate collector is partially suppressed by various inserted structures. The optical transmission of the cover of flat plate collectors is improved by interference layers. Thus an improvement is important when a correct azimuthal orientation of the collector is impossible. Results of an experimental comparative test of several commercial flat plate collectors are presented. Author (ESA)

THE PROPERTIES OF SOLAR AND HEAT PUMP HEATING SYSTEMS OF SMALL HOUSES AND ADDITIONAL HEAT SOURCES
Tino Kalema and Kari Wellman Apr. 1981 121 p refs In FINNISH; ENGLISH summary
(VTT-56; ISBN-951-38-1199-9; ISSN-0355-3469; RISO-M2241) Avail: NTIS HC A06/MF A01

The active use of solar energy in heating of small houses was studied with a computer program developed for this purpose. The calculations clear up the thermal properties of seven solar and heat pump systems with different operational principles. The following topics are studied: (1) how much energy is obtained from different heat sources (basic heat source, solar radiation, earth and wood); and (2) the influence of collector size, structure, and storage on the energy obtained from the collector in each system. The influence of the size and depth of the heat pump Earth pipes on compressor electricity consumption. Earth temperatures and freezing are also studied. Author (ESA)

GLASS-MAT-REINFORCED THERMOPLASTIC: STRONG, EASY TO WORK c27
Martin Welz, Erkhard Siler, and Hartmut Schriever *In its* W. Europe Rept.: Sci. and Technol., No 72 (JPRS-78876) 1 Sep. 1981 p 1-14 Transl. into ENGLISH from Tech. Rundschau (Bern), 2 Jun. 1981 p 33 and 35 (For primary document see N82-12645 03-44)
Avail: NTIS HC A03/MF A01

By means of the specifically oriented optimization of glass mats and matrix materials, it is possible to make semifinished products with adjusted shaping and flow performance. Semifinished product manufacturing is accomplished continually through the broad slit extrusion of the thermoplastic material. The soaking of the glass fibers with the polymer melt is performed by means of special process engineering measures so that a uniform distribution of the glass fibers is achieved in the plate along with intensive crosslinking with the polymers, without any noticeable air inclusions. Various coatings can be applied, such as metal foils and synthetic leathers. In contrast to hardenable semifinished products, the glass mat thermoplastics can be stored in an unlimited manner as semifinished materials. The mechanical properties of a polypropylene containing about 30% long glass fibers are compared with those of a steel plate and with SMC containing about 30% glass fibers. A.R.H.

SOLAR PROJECT AT ALMERIA NEARS COMPLETION
Hans Fricker *In its* W. Europe Rept.: Sci. and Technol., No. 72 (JPRS-78876) 1 Sep. 1981 p 15-17 Transl. into ENGLISH from Chem. Rundschau (Zurich), 25 May 1981 p 3 and 5 (For primary document see N82-12645 03-44)
Avail: NTIS HC A03/MF A01

Ninety-three mirrors (heliostats), steered by a computer, reflect the sunlight at all times of the day and year into the opening of a combustion chamber (receiver) mounted on a 43-meter high tower in southern Spain. The cooling medium, liquid sodium, is heated from 270 C to 530 C, after which it flows to the hot storage tank installed on the ground below. As needed, sodium can be circulated out of the tank through the steam generator into a cold storage tank and from there back to be reheated in the receiver. The steam created in the steam generator expands in a steam engine; the mechanical energy created there drives the 500 kW generator, which produces the electric power. The selection of sodium as the cooling medium, and the design of the receiver and the pressure relief system which guarantees the safety of the plant in the unlikely event of a steam pipe bursting are described. A.R.H

GERMAN-ARGENTINE EXPERIMENT: VERTICAL-ROTOR WIND ENGINE
Peter Raabe *In its* W. Europe Rept.: Sci. and Technol., No. 72 (JPRS-78876) 1 Sep. 1981 p 18-19 Transl. into ENGLISH from Tagesspiegel (Berlin), 4 Jul. 1981 p 12 (For primary document see N82-12645 03-44)
Avail: NTIS HC A03/MF A01

Designed by aerodynamists, a wind motor built in Patagonia, is independent of the direction of the wind due to its vertical rotating axis. The narrow rotor blades have optimum aerodynamic efficiency. Drum-like wind collectors at the top and bottom of the rotating axis serve as starters. The plant incorporates simple instead of sophisticated mechanical parts, and its maintenance requirements are extremely low. Only the two rotating bearings located at the top and bottom of the axis require lubrication, with the oil being changed only twice a year. A.R.H.

45 ENVIRONMENT POLLUTION

Includes air, noise, thermal and water pollution; environment monitoring; and contamination control.

DEVELOPMENT OF A MARINE MONITORING PROGRAM IN CALIFORNIA Ph.D. Thesis
Francis Henry Palmer, Jr. 1981 135 p
Avail: Univ. Microfilms Order No. 8121025

The development of a monitoring program for coastal and estuarine waters of California is described. A monitoring system was developed to provide a technical example of applying research findings to the establishment of a monitoring program and to give some independent, evaluative observations on the approach of the Water Resources Control board to supporting research investigations. A mussel watch concept of monitoring is based on using a marine organism, the mussel, as a sampling device. Locations where indigenous mussels bear elevated tissue levels of trace metal, petroleum hydrocarbons, and chlorinated hydrocarbons in comparison to other locations are identified. A research investigation is designed to examine the biological effects of observed elevated levels upon the organisms. Dissert. Abstr.

N82-12650 California Univ., Los Angeles.
A COMPUTER SIMULATION MODELING STUDY TO PREDICT AIR QUALITY IMPACTS FROM A 500 MW

COAL-FIRED POWER PLANT Ph.D. Thesis

Gary Van Jandegian 1981 255 p
Avail: Univ. Microfilms Order No. 8120979

A computer simulation modeling study was conducted to predict sulfur dioxide ambient air quality impacts resulting from the operation of a 500 megawatt coal-fired power plant expansion in the Trombay area of Bombay, India. The AQUAL, a multiple source Gaussian plume dispersion model employs diffusion coefficients and plume rise equations and predicts maximum and average 3 hour and 24 hour ground level pollutant concentrations for up to 250 receptor points within 20 kilometers of a power plant stack(s). Results of the modeling exercises are used to recommend proper SO2 controls such as flue gas desulfurization, fuel switching to low sulfur oil and natural gas, etc. Dissert. Abstr.

POLICY AND SUPPORT FOR RESEARCH IN MARINE LIFE SCIENCES

Hermann Bondi Sep. 1981 12 p
Copyright. Avail: Issuing Activity

The marine biological research effort is considered under a number of research headings: open ocean ecosystems, coastal and estuarine ecosystems, shores and marginal areas, southern ocean ecosystem, biological function, and marine mammals. The shifting emphasis in NERC's ecological research away from description based on the traditional survey type approach, towards studies in field and laboratory aimed at elucidating the fundamental processes that govern the behavior of estuarine, coastal, and open sea ecosystems, is highlighted. T.M.

N82-12652 Washington Univ., Seattle.

BENEFIT-COST ANALYSIS WITH UNCERTAIN INFORMATION: AN APPLICATION IN AIR POLLUTION CONTROL Ph.D. Thesis

Michael Gordon Ruby 1981 196 p
Avail: Univ. Microfilms Order No. 8121241

A form of the net present value decision rule for evaluating the economic advisability of policies and projects was developed and demonstrated. It discounts future benefits and costs at the social rate of time preference but accounts for the lost opportunity costs of the higher returns available to private investments. The uncertainties in the resulting calculations, due to inadequate data, for an air pollution control project at a model stationary source of sulfur dioxide air emissions were examined. Each of the variables in the rule for both a meso-scale and a long-range transport case at three levels of background pollutant concentrations were examined. Estimates are given for both the dominance of the variables at specific nominal values and the uncertainty in the individual terms. Dissert. Abstr.

SOLID WASTE DISPOSAL PRACTICES: OPEN DUMPS NOT IDENTIFIED. STATES FACE FUNDING PROBLEMS Report to the Honorable Albert Gore, Jr., House of Representatives

23 Jul. 1981 53 p
(CED-81-131) Avail: NTIS HC A04/MF A01

The problems of disposal and treatment of solid wastes from industrial, commercial, and residential sources are reported. The municipal waste and disposal facilities receive household wastes, medical wastes, paints, pesticides, dead animals, metals, plastics, and liquid chemical wastes. Many facilities are located on land that has little or no value for other uses, which poses the greatest potential for environmental damage, surface water and ground water contamination. Sanitary landfilling is a method of disposing of solid waste with only minimal damage to the environment and poses no hazard to public health or safety. Solid waste is also disposed on land through: surface impoundments (lagoons, pits, and ponds) for liquid wastes, and landspreading of sewage, industrial, and other sludges. Incineration and various resource recovery techniques are used to process waste. In is concluded that each of these processes results in a residue which must still be disposed of on the land. Suggestions for improved waste disposal are presented. E.A.K.

EFFECTS OF ACTIVITY INTERFERENCE ON ANNOYANCE DUE TO AIRCRAFT NOISE

Kelli F. Willshire and Clemens A. Powell Nov. 1981 29 p refs
(NASA-TP-1938; L-14808) Avail: NTIS HC A03/MF A01 CSCL 13B

The effects of aircraft flyover noise on annoyance were compared for face to face conversation, reverie, and television viewing. Eighteen 5 minute sessions, each composed of three flyovers, were presented on each of 2 days to subjects in a simulated living room. Twelve pairs of females and 12 pairs of males were tested, once before and once after work. Flyovers varied in peak noise level from 53 to 83 dB, A weighted. On each day, subjects engaged in 18 sessions, six of conversation, six of television viewing, and six of reverie. The subjects completed subjective ratings of annoyance and acceptability following every session. Annoyance and unacceptability rating scores were significantly higher for the activity of television viewing compared to conversation or reverie. There was no difference between judgments during the latter two activities. No differences were found in the judgments when compared on the basis of 'fatigue' (before/after work) or sex of the subject. Author

CALIBRATION OF A TURBIDITY METER FOR MAKING ESTIMATES OF TOTAL SUSPENDED SOLIDS CONCENTRATIONS AND BEAM ATTENUATION COEFFICIENTS IN FIELD EXPERIMENTS

J. W. Usry and C. H. Whitlock Oct. 1981 17 p refs
(NASA-TM-81873) Avail: NTIS HC A02/MF A01 CSCL 13B

Management of water resources such as a reservoir requires using analytical models which describe such parameters as the suspended sediment field. To select or develop an appropriate model requires making many measurements to describe the distribution of this parameter in the water column. One potential method for making those measurements expeditiously is to measure light transmission or turbidity and relate that parameter to total suspended solids concentrations. An instrument which may be used for this purpose was calibrated by generating curves of transmission measurements plotted against measured values of total suspended solids concentrations and beam attenuation coefficients. Results of these experiments indicate that field measurements made with this instrument using curves generated in this study should correlate with total suspended solids concentrations and beam attenuation coefficients in the water column within 20 percent. T.M.

PASSIVE OPTICAL SAMPLE ASSEMBLY (POSA) Final Report

Roger C. Linton, Edgar R. Miller, and Michael Susko Aug. 1981 47 p refs
(NASA-TM-82446) Avail: NTIS HC A03/MF A01 CSCL 13B

A Passive Optical Sample Assembly (POSA) unit was mounted and flown in the cargo bay of the space shuttle Columbia during the first Orbital Flight Test (OFT-1). A similar unit was mounted in a different location in the cargo bay during the postflight operations. The samples in both POSA arrays were subjected to a series of optical and analytical measurements prior to delivery for installation in the cargo bay and after retrieval of the flight hardware. The final results of a comparison of the two series of measurements are presented. These STS-1 results are based on data obtained from only a portion of one of the ten Induced Environment Contamination Monitor instruments to be flown on several shuttle flights beginning with STS-2. These limited results do not indicate shuttle contamination levels in excess of those anticipated. J.M.S.

ELECTRIC AND HYBRID VEHICLES ENVIRONMENTAL CONTROL SUBSYSTEM STUDY Final Technical Report

15 May 1981 288 p refs Sponsored in part by DOE Prepared for JPL
(Contract JPL-955682)

(NASA-CR-164995; JPL-9950-570; MTI-81TR36) Avail: NTIS HC A13/MF A01 CSCL 13B

An environmental control subsystem (ECS) in the passenger compartment of electric and hybrid vehicles is studied. Various methods of obtaining the desired temperature control for the battery pack is also studied. The functional requirements of ECS equipment is defined. Following categorization by methodology, technology availability and risk, all viable ECS concepts are evaluated. Each is assessed independently for benefits versus risk, as well as for its feasibility to short, intermediate and long term product development. Selection of the preferred concept is made against these requirements, as well as the study's major goal of providing safe, highly efficient and thermally confortable ECS equipment. S.L.

ELECTRIC AND HYBRID VEHICLE ENVIRONMENTAL CONTROL SUBSYSTEM STUDY Final Report
Kenneth L. Heitner 4 Dec. 1980 198 p refs Sponsored in part by DOE Prepared for JPL
(Contract JPL-955683)
(NASA-CR-164996; JPL-9950-569; Rept-97649-E005-UX-02) Avail: NTIS HC A09/MF A01 CSCL 13B

An environmental control subsystem (ECS) in electric and hybrid vehicles is studied. A combination of a combustion heater and gasoline engine (Otto cycle) driven vapor compression air conditioner is selected. The combustion heater, the small gasoline engine, and the vapor compression air conditioner are commercially available. These technologies have good cost and performance characteristics. The cost for this ECS is relatively close to the cost of current ECS's. Its effect on the vehicle's propulsion battery is minimal and the ECS size and weight do not have significant impact on the vehicle's range. S.L.

TREATMENT OF BIOMASS-GASIFICATION WASTEWATERS USING LIQUID-LIQUID EXTRACTION
N. E. Bell Sep. 1981 28 p refs
(Contract DE-AC06-76RL-01830)
(DE82-000711; PNL-4016) Avail: NTIS HC A03/MF A01

Distribution coefficients for chemical oxygen demand (COD) removal were determined for the following solvents: methylisobutyl ketone (MIBK), n-butyl acetate, n-butanol, MIBK/n-butyl acetate (50:50 vol), MIBK/n-butanol (50:50 vol), tri-butyl phosphate, tri-n-octyl phosphine oxide (TOPO)/MIBK (10:90 wt), TOPO/kerosene (10:90 wt), kerosene, and toluene. The best distribution coefficient of 1.3 was given by n-butanol. Chemical analysis of the wastewater by gas chromatography (GC) showed acetic acid and propionic acid concentrations of about 4000 mg/1. Methanol, ethanol, and acetone were identified in trace amounts. These five compounds accounted for 45 percent of the measured COD of 29,000 mg/1. DOE

LAGRANGIAN MEASUREMENTS OF SULFUR-DIOXIDE TO SULFATE CONVERSION RATES
B. D. Zak May 1981 38 p refs
(Contract DE-AC04-76DP-00789)
(DE82-000246; SAND-80-2175) Avail: NTIS HC A03/MF A01

On the basis of project MISTT data and proposed homogeneous gas phase oxidation mechanisms for sulfur dioxide, it is suggested that the degree of mixing with background air, the chemical composition of the background air, and the intensity of the sunlight available are key factors determining the rate of sulfur dioxide to sulfate conversion. These hypotheses were examined in light of Lagrangian measurements of conversion rates in power plant plumes. It is found that the Lagrangian conversion rate measurements are consistent with these hypotheses. T.M.

IMPACT OF ENERGY-RELATED POLLUTANTS ON CHROMOSOME STRUCTURE Progress Report, 1 Jan. - 31 Dec. 1981
Randolph L. Rill 1981 11 p
(Contract DE-AS05-78EV-05888)
(DE82-000153; DOE/EV-05888/4) Avail: NTIS HC A02/MF A01

Products of reactions of deoxyribonucleosides with diethylsulfate and ethyl methanesulfonate in neutral aqueous solution and in DMSO, and with ethyl iodide in DMSO, were seperated and quantitiated by reverse phase PHLC. Aqueous reactions yielded small, but significant, amounts of nucleosides modified at exocyclic positions. Several unidentified derivatives not previously reported were found. A method for resolving all known ethylated deoxyribonucleotides was developed. The covalent coupling of ethidium monoazide to DNA alone and DNA in chromatin was examined. Covalently bound ethidium preferentially bound to DNA recovered in subnucleosomes. The amount of covalently bound ethidium recovered in mononucleosomes decreased with increasing nuclease digestion, suggesting that nucleosomes most susceptible to nuclease attack preferentially bind ethidium. DOE

KINETICS OF WET OXIDATION OF BIOLOGICAL SLUDGES FROM COAL-CONVERSION WASTEWATER TREATMENT
R. K. Helling, M. K. Strobel, and R. J. Torres Sep. 1981 55 p refs
(Contract W-7405-eng-26)
(DE82-000525; ORNL/MIT-332) Avail: NTIS HC A04/MF A01

Combustible organics in aqueous solutions or suspensions, which are characteristic of waste aqueous solutions or suspensions, which are characteristics of waste treatment effluent from coal liquefaction, may be treatable by wet oxidation. The wet oxidation of model compounds (phenol in water or phenol in municipal waste sludge) in a batch autoclave reactor was found to proceed rapidly to 99% conversion in less than 15 min for temperatures between 185 and 2300C, oxygen pressures between 2000 and 1300 psig, and initial phenol concentrations of 2.5, 10, and 50 g/L. The reaction occurs in three phases: a slow induction period, a fast first-order reaction with a low activation energy of 4.9 kcal/gmol, followed by a slow first-order reaction. During the reaction a variety of colored intermediates (catechol, succinic acid, hydroquinine) form. It is postulated that the fast portion of the reaction sequence follows free-radical mechanism. DOE

N82-12675# Zawadzki (Edward A.) Ltd., McMurray, Pa.
PRELIMINARY STUDY: USE OF LOW-SULFUR COAL AND COAL CLEANING IN CONTROL OF ACID RAIN
May 1981 38 p
(Contract DE-AC21-80MC-14784)
(DE81-028930; DOE/MC-14784/T1) Avail: NTIS HC A03/MF A01

The acid rain problem and the feasibility of various control techniques are addressed. Two strategies that are proposed for control of acid rain, are considered, (1) use of naturally occurring low-sulfur coal; and (2) cleaning of raw coal in preparation plants prior to firing. The distribution and ownership of the US coal reserves are discussed with emphasis on the reserves having low sulfur content. Some of the basic constraints on the availability and use of low-sulfur coals by utilities are enumerated. A preliminary estimate of the sulfur reduction potential of US coals achievable by coal preparation is presented. Also included are a brief analysis of coal cleaning costs and the effects of coal cleaning on other aspects of acid rain control. DOE

N82-12676# Los Alamos Scientific Lab., N. Mex.
ENVIRONMENTAL CONTROL TECHNOLOGY FOR COAL CLEANING WASTES
P. Wagner, R. C. Heaton, L. E. Wangen, A. M. Nyitray, and M. M. Jones 1981 20 p refs Presented at a Workshop on Processing Needs and Methodology for Wastewaters from the Conversion of Coal, Oil Shale and Biomass to Synfuels, Germantown, Md., Jun. 1981
(Contract W-7405-eng-36)
(DE81-025331; LA-UR-81-1904; CONF-8106109-1) Avail: NTIS HC A02/MF A01

Three approaches to solution of the coal waste drainage problem are considered. The first is alteration of the waste to render it nonpolluting. Calcining of the waste is shown to be an effective way of accomplishing this, but the cost of this technique is too high. The second approach is codisposal of the coal waste with neutralizing and/or absorbing agents. The best way to implementing this approach is sequential slurry coating of the coal waste with lime and limestone, which is both effective and inexpensive. This is the best of the one time treatment which were evaluated when both effectiveness and cost are considered. The third approach to controlling coal waste effluent is by alkaline neutralization of the drainages. It is shown that it is effective provided that the iron is oxidized to the plus three oxidation state, and that the cost of this treatment is low. T.M.

THREE DIMENSIONAL SIMULATION MODEL MODIS FOR THE PROPAGATION OF AIR POLLUTANTS
D. Eppel, J. Haeuser, and A. Mueller 13 Mar. 1981 15 p refs Presented at 5th Intern. Clean Air Congr., Buenos Aires, 20-26 Oct. 1980
(GKSS-80-E-56; ISSN-0344-9629) Avail: NTIS HC A02/MF A01

A three-dimensional model for the propagation of pollutants in the atmosphere is presented. The moments of the unknown concentration distribution with respect to one horizontal coordinate, i.e., normalization, mean value, width, skewness, etc., are determined by integrating numerically the pertaining transport equations over a vertical plane oriented in the main flow direction. The original three dimensional distribution can then be reconstructed approximately. Partial absorption at the surface boundary as well as decay, rainout, and washout processes may be simulated for various meteorological conditions. The numerical treatment of the transport equation is done using discrete element techniques. The resulting equations are integrated by an explicit scheme. Author (ESA)

A STATISTICAL EVALUATION OF OHMSETT TESTING Final Report
Diane M. Foster, Sol H. Schwarz, and Gary F. Smith Jul. 1981 39 p ref Prepared in cooperation with Mason and Hanger-Silas Mason Co., Inc., Leonardo, N.J.
(Contract EPA-68-03-2642)
(PB81-226128; EPA-600/2-81-124) Avail: NTIS HC A03/MF A01 CSCL 13B

This program was initiated to provide a statistical evaluation of performance data generated at the USEPA's Oil and Hazardous Materials Simulated Environmental Test Tank (OHMSETT). The objective was to investigate the value of replicate testing in developing efficient test programs giving the maximum reliable information from the minimum number of tests. This study was set up in two separate programs, each consisting of 24 tests: one program where 24 different conditions were tested and a second program where three replicates each of eight different conditions were tested. A comparison was then possible between the two types of programs. The 3-replicate test matrix was duplicated to produce six replicates and the validity of the nonreplicate and 3-replicate programs was evaluated with respect to the 6-replicate data. GRA

AN EXPERIMENTAL STUDY OF THE PROPAGATION AND

DISPERSION OF INTERNAL ATMOSPHERIC GRAVITY WAVES Ph.D. Thesis
Kenneth Alan Ballard 1981 423 p
Avail: Univ. Microfilms Order No. 8120765

Traveling ionospheric disturbances (TID's) are the manifestation, in the ionized medium, of internal atmospheric gravity waves. A model describing the propagation of gravity waves in an isothermal atmosphere is presented. The dispersion relation is derived from fundamental principles, and the relation between phase velocity and group velocity is examined. The effects of the Coriolis force and horizontally stratified winds on wave propagation are also analyzed. Conservation of energy in the gravity wave requires increasing amplitude with increasing altitude, inasmuch as the atmospheric density decreases with height. However, this is counteracted by dissipation of wave energy by ion drag, thermal conductivity, and viscous damping. The production of TID's (in the ionized medium) by gravity waves (in the neutral medium) is discussed in quantitative terms, and the vertical predictive function were derived. Dissert. Abstr.

DETERMINATION OF CRUSTAL Q STRUCTURE FROM MULTI-MODE SURFACE WAVES Ph.D. Thesis
Chung-Chuan Cheng 1980 169 p
Avail: Univ. Microfilms Order No. 8120600

Determinations of Q structures are made using a method which matches theoretical and observed surface wave spectra. The importance of the method lies in its ability to utilize relatively short paths between a single source and a single receiver, both of which are preferably located within a single geologic province. In order to obtain theoretical Rayleigh wave spectral amplitudes at relatively short periods, improvements are made to existing computational schemes for computing the displacement-stress eigenfunctions as functions of depth. The effects of focal depth variations on the Rayleigh wave spectra for both fundamental and higher modes are studied. Inclusion of higher-mode data not only broadens the data base, but is also helpful when there is focal depth ambiguity. Dissert. Abstr.

AN INVESTIGATION OF SAND AND SANDSTONE PERMEABILITY DEGRADATION AT ELEVATED TEMPERATURE AND PRESSURE Ph.D. Thesis
James Arthur Stottlemyre 1981 177 p
Avail: Univ. Microfilms Order No. 8121249

Masillon sandstone, 'virgin' Ottawa sand, and 'washed' Ottawa sand were examined. The dependent variables monitored during the experiments were permeability, volumetric strain, pH, suspended solids, and dissolved solids. Potential permeability damage mechanisms investigated include: pore volume reduction via bulk sample compaction and/or thermal expansion of constituent minerals, thermomechanical fragmentation, salinity and/or pH-induced particle dispersion, and temperature-induced internal or external particulate plugging. It is concluded that Masillon sandstone and Ottawa sand intrinsic permeabilities to deionized, deaerated water are not temperature sensitive to a significant degree provided certain precautions are taken to avoid colloidal contamination from the upstream hardware.

HEAT FLOW STUDIES AND GEOTHERMAL EXPLORATION IN WESTERN TRANS-PECOS TEXAS Ph.D. Thesis
Bruce D. G. S. Taylor 1981 339 p
Avail: Univ. Microfilms Order No. 8121977

The definition of possible geothermal resources in Trans-Pecos Texas, and a geothermal gradient map of the region are presented, based on nearly 200 temperature and gradient measurements. Several areas of high thermal gradient are located, notably in Presidio County, where several hot springs and wells exist. Possible mechanisms for the high gradients (and heat flow) here are discussed. A small high gradient area is also indicated in northeast El Paso County, and a geophysical investigation of this prospect is described. The proximity to the city of El Paso made this a prime target for resource evaluation. Geophysical methods employed include gravity, self-potential and electrical resistivity, the surveys culminating in a shallow drilling program to define the areal extent of the anomaly. Dissert. Abstr.

MICROWAVE LIMB SOUNDER Patent
Jacob J. Gustincic, inventor (to NASA) (JPL, California Inst. of Tech., Pasadena) Issued 4 Aug. 1981 9 p Filed 24 Sep. 1979 Supersedes N79-34014 (17 - 24, p 3285) Sponsored by NASA
(NASA-Case-NPO-14544-1; US-Patent-4,282,525;
US-Patent-Appl-SN-078612; US-Patent-Class-343-100ME;
US-Patent-Class-343-100PE; US-Patent-Class-343-781P) Avail: US Patent and Trademark Office CSCL 04A

Trace gases in the upper atmosphere can be measured by comparing spectral noise content of limb soundings with the spectral noise content of cold space. An offset Cassegrain antenna system and tiltable input mirror alternately look out at the limb and up at cold space at an elevation angle of about 22. The mirror can also be tilted to look at a black body calibration target. Reflection from the mirror is directed into a radiometer whose head functions as a diplexer to combine the input radiation and a local ocillator (klystron) beam. The radiometer head is comprised of a Fabry-Perot resonator consisting of two Fabry-Perot cavities spaced a number of half wavelengths apart. Incoming radiation received on one side is reflected and rotated 90 deg in polarization by the resonator so that it will be reflected by an input grid into a mixer, while the klystron beam received on the other side is also reflected and rotated 90 deg, but not without passing some energy to be reflected by the input grid into the mixer.

SAGE MEASUREMENTS OF THE STRATOSPHERIC AEROSOL DISPERSION AND LOADING FROM THE SOUFRIERE VOLCANO
M. Patrick McCormick, Geoffrey S. Kent (Institute for Atmospheric Optics and Remote Sensing Hampton, Va.), Glenn K. Yue (Institute for Atmospheric Optics and Remote Sensing Hampton, Va.), and Derk M. Cunnold (Georgia Inst. of Techn., Atlanta) Nov. 1981 23 p refs
(NASA-TP-1922; L-14611) Avail: NTIS HC A02/MF A01 CSCL 04A

Explosions of the Soufriere volcano on the Caribbean Island of St. Vincent reduced two major stratospheric plumes which the stratospheric aerosol and gas experiment (SAGE) satellite tracked to West Africa and the North Atlantic Ocean. The total mass of the stratospheric ejecta measured is less than 0.5% of the global stratospheric aerosol burden. No significant temperature or climate perturbation is expected. It is found that the movement and dispersion of the plumes agree with those deduced from high altitude meteorological data and dispersion theory. The stratospheric aerosol dispersion and loading from the Soufrier volcano was measured. E.A.K.

MOUNT ST. HELENS VOLCANIC-ASH FALL IN THE BULL RUN WATESHED, OREGON, MARCH - JUNE 1980
Michael V. Shulters and Daphne G. Clifton 1980 19 p refs

(USGS-CIRC-850-A) Avail: NTIS HC A02/MF A01

Volcanic ash fall from the eruption of Mount St. Helens, Washington, was studied. Water samples collected from three stream sites within the Bull Run Watershed were compared with samples collected during the same season in previous years. No detectable changes were noted in chemical characteristics. Precipitation samples collected immediately after the June 12 and 13 ash fall ranged in specific conductance from 20 to 41 micromhos per centimeter at 25 C and in pH from 4.0 to 4.3 pH units. Stream samples collected during the May to June period ranged in specific conductance from 18 to 28 micromhos per centimeter at 25 C and in pH from 6.7 to 7.5 pH units. Volcanic ash samples were collected and analyzed for particles size, chemical composition, and weight. Significant differences in particle size of ash were found in samples from two seperate eruptions. R.J.F.

EFFECTS OF VOLCANISM ON THE GLACIERS OF MOUNT ST. HELENS

Melinda M. Brugman and Austin Post 1981 15 p
(USGS-CIRC-850-D) Avail: NTIS HC A02/MF A01

The cataclysmic eruption of Mount St. Helens Mav 18, 1980, removed 2.9 sq/km of glacier snow and ice including a large part of Shoestring Forsyth, Wishbone, Ape, Nelson, and all of Loowit and Leschi Glaciers. Minor eruptions and bulging of the volcano from March 27 to May 17 shattered glaciers which were on the deforming rock and deposited ash on other glaciers. Thick ash layers persisted after the May 18 eruption through the summer on most of the remaining snow and ice, and protected winter snow from melting on Swift and Dryer Glaciers. Melting and recrystallization of snow and ice surviving on Mount St. Helens could cause and lubricate mud flows and generate outburst floods. Author

EARTHQUAKES IN THE UNITED STATES, JULY - SEPTEMBER 1979

J. H. Minsch, C. W. Stover, W. J. Person, and P. K. Smith 1980 43 p refs
(USGS-CIRC-836-C) Avail: NTIS HC A03/MF A01

This earthquake information supplements that published in the NEIS (National Earthquake Information Service) publications, PDE ('Preliminary Determination of Epicenters') and 'Preliminary Determination of Epicenters, Monthly Listing', by providing detailed felt and intensity data, for U.S. earthquakes. It provides a complete listing of macroseismic effects of earthquakes, which can be used in risk studies, nuclear power plant site evaluations, seismicity studies, and to answer inquiries by the public. The first part (table 1), which is mainly concerned with data obtained by seismographs, is a tabular listing of earthquakes in chronological order by State, consisting of the following basic information: date, origin time, hypocenter, magnitude, maximum intensity, and computational source of the hypocenter. The second section, which concerns intensity information, consists of two maps and table 2. This section also contains information on events which were felt but were not listed in the PDE because there was not enough instrumental data to obtain a solution. J.F.M.

ON THE GEODETIC STABILITY OF THE GODDARD OPTICAL RESEARCH FACILITY

William J. Webster, Jr., Paul D. Lowman, Jr., and Richard J. Allenby Sep. 1981 25 p refs Submitted for publication
(NASA-TM-82175) Avail: NTIS HC A02/MF A01 CSCL 08G

Seismic observations of earthquakes and blasts, geologic analysis of LANDSAT images, and a search of the historical record was examined. However, no evidence for tectonic motion was found. Some faulting is present in the area but no evidence of seismic activity was found. No elastic resonances in the range from 0.3 to 15 Hz were found. It is concluded that, except for ground water induced changes, the facility is stable at least to the 0.5 cm level. E.A.K.

BIOGEOCHEMICAL EVIDENCE FOR SUBSURFACE HYDROCARBON OCCURRENCE, RECLUSE OIL FIELD, WYOMING: PRELIMINARY RESULTS

Mary C. Dalziel and Terrence J. Donovan 1980 14 p refs
(USGS-CIRC-837) Avail: NTIS HC A02/MF A01

Anomalously high manganese to iron ratios occurring in pine needles and sage leaves over the Recluse oil field, Wyoming, suggest effects of petroleum microseepage on the plants. This conclusion is supported by iron and manganese concentrations in soils and carbon and oxygen isotope ratios in rock samples. Seeping hydrocarbons provided reducing conditions sufficient to enable divalent iron and manganese to be organically complexed or adsorbed on solids in the soils. These bound or adsorped elements in the divalent state are essential to plants, and the plants readily assimilate them. The magnitude of the plant anomalies, combined with the supportive isotopic and chemical evidence confirming petroleum leakage, makes a strong case for the use of plants as a biogeochemical prospecting tool. GLOBAL ISOSTATIC GEOID ANOMALIES FOR PLATE AND BOUNDARY LAYER MODELS OF THE LITHOSPHERE

Bradford H. Hager 10 Nov. 1981 34 p refs
(Grant NsG-7610)
(NASA-CR-164985) Avail: NTIS HC A03/MF A01 CSCL 08G

Commonly used one dimensional geoid models predict that the isostatic geoid anomaly over old ocean basins for the boundary layer thermal model of the lithosphere is a factor of two greater than that for the plate model. Calculations presented, using the spherical analogues of the plate and boundary layer thermal models, show that for the actual global distribution of plate ages, one dimensional models are not accurate and a spherical, fully three dimensional treatment is necessary. The maximum difference in geoid heights predicted for the two models is only about two meters. The thermal structure of old lithosphere is unlikely to be resolvable using global geoid anomalies. Stripping the effects of plate aging and a hypothetical uniform, 35 km, isostatically-compensated continental crust from the observed geoid emphasizes that the largest-amplitude geoid anomaly is the geoid low of almost 120 m over West Antarctica, a factor of two greater than the low of 60 m over Ceylon. SYNTHESIS OF REGIONAL CRUST AND UPPER-MANTLE STRUCTURE FROM SEISMIC AND GRAVITY DATA Final Report, 15 Jun. 1978 - 14 Jun. 1979

S. S. Alexander and P. M. Lavin 14 Jun. 1979 89 p refs
(Grant NsG-5276)
(NASA-CR-165001) Avail: NTIS HC A05/MF A01 CSCL 08K

Available seismic and ground based gravity data are combined to infer the three dimensional crust and upper mantle structure in selected regions. This synthesis and interpretation proceeds from large-scale average models suitable for early comparison with high-altitude satellite potential field data to more detailed delineation of structural boundaries and other variations that may be significant in natural resource assessment. Seismic and ground based gravity data are the primary focal point, but other relevant information (e.g., magnetic field, heat flow, LANDSAT imagery, goedetic leveling, and natural resources maps) is used to constrain the structure inferred and to assist in defining structural domains and boundaries. The seismic data consists of regional refraction lines, limited reflection coverage, surface wave dispersion, teleseismic P and S wave delay times, anelastic absorption, and regional seismicity patterns. The gravity data base consists of available point gravity determinations for the areas considered. S.L.

RADIATION BUDGET MEASUREMENT/MODEL INTERFACE RESEARCH Semiannual Report

Thomas H. VonderHaar Oct. 1981 37 p refs
(Grant NAG1-150)
(NASA-CR-165000) Avail: NTIS HC A03/MF A01 CSCL 04A

The NIMBUS 6 data were analyzed to form an up to date climatology of the Earth radiation budget as a basis for numerical model definition studies. Global maps depicting infrared emitted flux, net flux and albedo from processed NIMBUS 6 data for July, 1977, are presented. Zonal averages of net radiation flux for April, May, and June and zonal mean emitted flux and net flux for the December to January period are also presented. The development of two models is reported. The first is a statistical dynamical model with vertical and horizontal resolution. The second model is a two level global linear balance model. The results of time integration of the model up to 120 days, to simulate the January circulation, are discussed. Average zonal wind, meridonal wind component, vertical velocity, and moisture budget are among the parameters addressed. J.M.S.

TOWARD AN UNDERSTANDING OF THE TURBULENT ELECTRODE EFFECT OVER LAND Interim Report

J. C. Willett 29 Sep. 1981 32 p refs
(RR0330242)
(AD-A104902; NRL-8519) Avail: NTIS HC A03/MF A01 CSCL 09/1

A new concept of the turbulent electrode effect, which has emerged from the recent work of Hoppel and of the author, is described. The past theoretical and observational research relating to the transformation of the classical electrode layer in the case of strong turbulent mixing is reviewed. Results of two experiments designed to test key predictions of the new theories are reported. The first experiment, measurement of the conductivity profile over land on windy days, lends some support to the theoretical prediction that both the positive and the negative polar components of the atmospheric conductivity should decrease toward the surface under turbulent conditions. The second experiment measurement of the nonconductive component of the vertical current density at the ground, tends to confirm a crucial assumption of the theories that all of the current is carried by turbulent and molecular diffusion at the surface. Suggestions are given for further experimental and theoretical work. Author (GRA)

PITCH-ANGLE DIFFUSION IN CANONICAL COORDINATES: A THEORETICAL FORMULATION

Michael Schulz 21 Aug. 1981 37 p refs
(Contract F04701-80-C-0081)
(AD-A105392; TR-0081(6960-06)-4; SD-TR-81-69) Avail: NTIS HC A03/MF A01 CSCL 04/1

The equation for pitch-angle diffusion (at constrant particle energy E and shell parameter L) in a dipole field can be transformed into canonical form, by the introduction of a new coordinate called z. The new coordinate is obtained by integrating the bounce period of a particle (at fixed E and L) with respect to y sq, where y is the sine of the equatorial pitch angle alpha sub 0. A potpourri of applications serves to illustrate the usefulness of such a transformation. For example, if D sub zz is a suitably simple function of z, one can specify the eigenfunctions g sub n(z) of the diffusion operator is closed form. If D sub zz differs only slightly from such a simple function of z, then the corresponding eigenfunctions can be generated from the above set by procedures analogous to the Rayleigh-Schrodinger perturbation theory used in quantum mechanics. The availability of such eigenfunctions enables one to evaluate quantitatively the manner in which geomagnetically trapped particles are redistributed in alpha sub 0 and lost from the magnetosphere as the phase-space density f evolves in time. The general terrestrial mapping, charting, and geodesy (MC&G) problem can best be formulated as the problem of generating a metric description of the earth and its physical properties -- a description in which relative positions within and on the surface of the earth are accurately described, the figure of the earth is accurately portrayed, and the gravitational, magnetic, and spin properties of the earth are fully represented in quantitative terms. Broader and more comprehensive definitions of the MC&G problem might be found within the domain of the planetological sciences, but the concept of quantitative metric relationships resulting from actual measurement processes will always be central to the definition. In the context of modern weapon systems, MC&G applications tend to concentrate in the areas of relative position determination on the surface of the earth and quantitative characterization of the terrestrial gravity field. The classical long-range artillery problem, for example, requires highly accurate knowledge of gun and target locations with respect to a common datum in a well-defined local coordinate system, together with approximate characterization of the gravity field, if a reliable one-shot hit capability is required. Practical constraints on achieving this capability, due partly to gun/target relative location limitations and partly to non-geodetic problems in the aiming process, lead to a multiple-shot, shoot-sense-correct philosophy that persists to this day. REDUCTION OF PHOTOSYNTHETICALLY ACTIVE RADIATION UNDER EXTREME STRATOSPHERIC AEROSOL LOADS

Siegfried A. W. Gerstl and Andrew Zardecki Aug. 1981 24 p refs
(Contract W-7405-eng-36)
(DE81-030506; LA-8938-MS) Avail: NTIS HC A02/MF A01

The hypothesis that the Cretaceous-Tertiary extinctions might be caused by an obstruction of sunlight is tested by model calculations. First the total mass of stratospheric aerosols under normal atmospheric conditions is compared for four different (measured) aerosol size distributions and vertical profiles. For comparison, the stratospheric dust masses after four volcanic eruptions are also evaluated. Detailed solar radiative transfer calculations are then performed for artificially increased aerosol amounts until the postulated darkness scenario is obtained. Thus it is found that a total stratospheric aerosol mass between 1 and 4 times 10 g is sufficient to reduce photosynthesis to 10 of normal. The impact of a 0.4 to 3 km diameter asteroid or a close encounter with a Halley size comet may deposit that amount of particulates into the stratosphere. The darkness scenario of Alverez et al. is thus shown to be a possible extinction mechanism, even with smaller size asteroids of comets than previously estimated. DOE

CALCULATIONS ON SEISMIC COUPLING OF UNDERGROUND EXPLOSIONS IN SALT

M. E. Heusinkveld 20 Jan. 1981 117 p refs
(Contract W-7405-eng-48)
(DE81-030633; UCRL-53103) Avail: NTIS HC A06/MF A01

The results of a theoretical study of seismic coupling and decoupling of underground explosions in a salt medium are presented. A series of chemical and nuclear explosions was carried out in salt domes for the Cowboy and the Dribble programs to provide experimental data on seismic coupling for both tamped explosions and explosions in cavities. the Cowboy program consisted of a series of chemical explosions, and the Dribble program consisted of the tamped nuclear Salmon event, the Sterling nuclear event in the Salmon cavity, and an associated site calibration errors. The results of extensive computer calculations, which are in satisfactory agreement with the experimental data are given. The calculations were extended to give general results on seismic coupling in salt. The measure of seismic coupling was the rsidential reduced displacement potential (residual RDP). The decoupling associated with a shot in a cavity is expressed as the ratio of the resulting residual RDP to that of an equal sized tamped shot. DOE

ENVIRONMENTAL DATA FOR SITES IN THE NATIONAL SOLAR DATA NETWORK

Aug. 1981 176 p Prepared for Argonne National Lab.
(Contract DE-AC01-79CS-30027)
(DE82-000071; SOLAR/0010-81/08) Avail: NTIS HC A09/MF A01

Environmental information collected at the sites of the National Solar Data Network is tabulated for each solar site. The sites are grouped into 12 zones, each of which consists of several adjacent states. The insolation table presents the total, diffuse, direct, maximum, and extraterrestrial radiation for the site. It also shows the ratio of total to extraterrestrial radiation. The temperature table gives the average, daytime, nighttime, maximum, minimum, and inlet-water temperature for the site. All of the passive and some active solar sites are equipped with wind sensors which provide information on wind speed and direction. For some sites, a humidity tables provides relative humidity values for day and night. It also gives values for the maximum and minimum humidity for each day. A technical discussion of the instruments and measurements used to obtain the data is included. DOE

GEOCHEMICAL MODELING: A REVIEW

E. A. Jenne Jun. 1981 58 p refs
(Contract DE-AC06-76RL-01830)
(DE81-028969; PNL-3574) Avail: NTIS HC A04/MF A01

Two general families of geochemical models are reviewed. The ion speciation solubility group of geochemical models contain submodels to first calculate distribution of aqueous species and to secondly test the hypothesis that the water is near equilibrium with particular solid phases. The second geochemical models, the reaction path models, simulates the step wise precipitation of solid phase as a result of reacting specified amounts of water and rock. It is suggested that improvements in the present versions of these models enhances their velue and usefulness to applications in nuclear waste isolation. DOE

PROJECT PORCUPINE: MAGNETOMETER EXPERIMENT Final Report

Burkhard Theile and Hermann Luehr Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 48 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-80-028; ISSN-0170-1339) Avail: NTIS HC A03/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 10,10

The measurement of the particle current with a magnetometer is discussed. This allows an assessment of the total flux of particles originating from the magnetosphere and arriving in the ionosphere. The four sounding rocket payloads PORCUPINE, launched as part of the German contribution to the International Magnetosphere Study, were equipped with three component fluxgate magnetometers. Scientific data analysis for two flights is presented. The magnetic effects of active plasma experiments as well as of field aligned currents is observed. Author (ESA)

An impedance probe was used to measure the absolute value of the local electron densities in the thermosphere and the ionosphere in order to deduce the conductivity. The frequency dependence of the mutual impedance of a double sphere system was used to determine the electron density. The applied electronic concept is described in detail. The electron temperature cannot be derived by means of this method. The electron density profiles and hence the conductivity profiles are determined with good accuracy and sufficient resolution. With regard to an exclusive measurement of the in situ electron density, the self-impedance probe is to be given preference over the transfer impedance probe used because interpretation of the measurement is simpler and safer. REMOTE DETERMINATION OF ATMOSPHERIC GASES WITH A DF LASER Ph.D. Thesis - Hamburg Univ. [FERNMESSUNG ATMOSPHAERISCHER GASE MIT EINEM DF-LASER]
J. Altmann 1980 160 p refs In GERMAN; ENGLISH summary
(GKSS-80-E-40) Avail: NTIS HC A08/MF A01

A system for the remote quantitative depth resolved determination of atmospheric gases is described. Measurements can contribute to the control of air pollution in industrial areas. The system is based on the differential absorption and scattering of laser light, the so-called DIAL lidar technique. The possibilities of remote determination of gases with the aid of pulsed DF lasers were investigated. Special design features, such as the purely geometric compression of the signal amplitude dynamics, and commercially unavailable components, i.e., the fast sensitive low noise preamplifiers and the multiple input analog delay multiplexer, are described in detail. Molecular absorption cross sections required for calibration and interference evaluation are measured with a multipass absorption cell. As an example, results of a determination of atmospheric N2O are presented. Author (ESA)

INFRARED SPECTROSCOPY OF MICROORGANISMS NEAR 3.4 MICRONS IN RELATION TO GEOLOGY AND ASTRONOMY
F. Hoyle, N. C. Wickramasinghe, S. Al-Mufti, and A. H. Olavesen Jun. 1981 11 p refs Submitted for publication
(Preprint-69) Avail: NTIS HC A02/MF A01

Cracking of microorganisms at high temperature and pressure were examined for the existence of microfossils in sedimentary rocks of the Isna series. Microorganism specimens were examined for degradation by infrared spectroscopy over the wavelength range from 2.5 microns to 15 microns. Stability up to 380 C after which there is degradation towards graphite is shown. It is concluded that the preservation of microfossils is feasible in rocks metamorphosized at temperatures of 400 C. Tabular and graphical ozonometry results are presented. Surface ozone measurement data cover day of measurement, daily mean of ozone near the ground (nbar), daily maximum of ozone near the ground (nbar), hour of maximum (GMT), duration of extreme values in excess of 100 nbar in tens of minutes, daily minimum (nbar), and monthly mean (without extreme values). Total ozone measurement data, determined by Dobson-spectrophotometer, include day of measurement, time of observation, type of measurement, i.e., direct Sun blue zenith, number of measurements for daily mean, and total ozone amount for AD and C wavelengths (daily mean values). The pairs of wavelengths used are: 305.5 nm, 325.4 nm; 311.45 nm, 332.4 nm; and 317.6 nm, 339.8 nm. Author (ESA)

THE NUMERICAL STUDIES PROGRAM FOR THE ATMOSPHERIC GENERAL CIRCULATION EXPERIMENT (AGCE) FOR SPACELAB FLIGHTS
William W. Fowlis, ed. and M. H. Davis, ed. (Univ. Space Research Association, Boulder, Colo.) Nov. 1981 65 p refs Proc. of Meeting held in Boulder, Colo., 14-15 Apr. 1981
(NASA-CP-2200; M-366) Avail: NTIS HC A04/MF A01 CSCL 04B

The atmospheric general circulation experiment (AGCE) numerical design for Spacelab flights was studied. A spherical baroclinic flow experiment which models the large scale circulations of the Earth's atmosphere was proposed. Gravity is simulated by a radial dielectric body force. The major objective of the AGCE is to study nonlinear baroclinic wave flows in spherical geometry. Numerical models must be developed which accurately predict the basic axisymmetric states and the stability of nonlinear baroclinic wave flows. A three dimensional, fully nonlinear, numerical model and the AGCE based on the complete set of equations is required. Progress in the AGCE numerical design studies program is reported. For individual titles, see N82-12716 through N82-12723.

OVERVIEW
William W. Fowlis *In its* The Numerical Studies Program for the Atmospheric Gen. Circ. Expt. (AGCE) for Spacelab Flights Nov. 1981 p 1-9 (For primary document see N82-12715 03-47)
Avail: NTIS HC A04/MF A01 CSCL 04B

The creation of a spherical model in cylindrical geometry is discussed. The model requires a radial body force to simulate gravity. This force is achieved by dielectric effects on a liquid in the presence of a large voltage, but in the terrestrial laboratory it cannot be made large enough to overwhelm gravity. However, in an orbiting vehicle like Spacelab, this dielectric force will dominate. The behavior of a stripped down general circulation system (GCS) is a salient omission of GCM. It is suggested that the system will contribute to global weather and climate studies. E.A.K.

THE AGCE APPARATUS
William W. Fowlis *In its* The Numerical Studies Program for

the Atmospheric Gen. Circ. Expt. (AGCE) for Spacelab Flights Nov. 1981 p 10-15 ref (For primary document see N82-12715 03-47)
Avail: NTIS HC A04/MF A01 CSCL 04B

The atmospheric general circulation experiment (AGCE) apparatus, an instrument to extend previous experimental work on baroclinic flows in cylindrical geometry to spherical geometry was proposed. The instrument must be flown in Spacelab to allow the radial dielectric body force which simulates gravity to be dominant. The essential configuration of the proposed apparatus is shown. Some preliminary values of dimensions and imposed conditions are included. E.A.K.

HYDROSTATIC CALCULATIONS OF AXISYMMETRIC FLOW AND ITS STABILITY FOR THE AGCE MODEL

Timothy L. Miller and Robert L. Gall *In* NASA. Marshall Space Flight Center The Numerical Studies Program for the Atmospheric Gen. Circ. Expt. (AGCE) for Spacelab Flights Nov. 1981 p 16-22 (For primary document see N82-12715 03-47)
Avail: NTIS HC A04/MF A01 CSCL 04B

Baroclinic waves in the atmospherics general circulation experiment (AGCE) apparatus by the use of numerical hydrostatic primitive equation models were determined. The calculation is accomplished by using an axisymmetric primitive equation model to compute, for a given set of experimental parameters, a steady state axisymmetric flow and then testing this axisymmetric flow for stability using a linear primitive equation model. Some axisymmetric flows are presented together with preliminary stability calculations. E.A.K.

SPHERICAL MODELS: BASIC STATES AND STABILITY

Glyn O. Roberts *In its* The Numerical Studies Program for the Atmospheric Gen. Circ. Expt. (AGCE) for Spacelab Flights Nov. 1981 p 33-36 (For primary document see N82-12715 03-47)
Avail: NTIS HC A04/MF A01 CSCL 04B

Steady axisymmetric basic states in a spherical cap and their stability to azimuthally varying perturbations of different wave numbers were numerically investigated. The main features of the planned computer code and numerical methods are outlined. E.A.K.

N82-12721*# Tennessee Univ. Space Inst., Tullahoma.

THE THREE DIMENSIONAL SPHERICAL MODEL FOR THE AGCE

Basil N. Antar *In* NASA. Marshall Space Flight Center The Numerical Studies Program for the Atmospheric Gen. Circ. Expt. (AGCE) for Spacelab Flights Nov. 1981 p 37-39 (For primary document see N82-12715 03-47)
Avail: NTIS HC A04/MF A01 CSCL 04B

The development of accurate numerical model of the atmospheric general circulation experiment (AGCE) is discussed. The model will serve both as a design and diagnostic tool for the AGCE, as well as for conducting numerical experiments which otherwise cannot be performed by AGCE. The code in its final form will solve the complete three dimensional nonlinear Navier-Stokes energy equations with the Boussinesq approximation. The code will allow for any thermal boundary conditions and any external forcing in the form of rotation and body forces and will allow for variable thermodynamic coefficients. E.A.K.

N82-12722*# National Aeronautics and Space Administration. Marshall Space Flight Center, Huntsville, Ala.

MODEL VERIFICATION STUDIES USING ACCURATE MEASUREMENTS OF SPIN UP

Jae M. Hyun *In its* The Numerical Studies Program for the Atmospheric Gen. Circ. Expt. (AGCE) for Spacelab Flights Nov. 1981 p 40-43 refs (For primary document see N82-12715 03-47)
Avail: NTIS HC A04/MF A01 CSCL 04B

The reliability and accuracy of the numerical code for spin up flows in a cylinder by comparing the numerical results against high resolution laser Doppler velocimeter (LDV) measurements of the azimuthal flows were checked. A computer code to generate numerical solution for axisymmetric rotating fluid in a cylinder was obtained and amended for routine use at MSFC. The numerical simulations used the Navier-Stokes equations in axisymmetric form and employed finite difference techniques on both constant and variable grids. The numerical solutions are analyzed to gain further insight into the fundamental questions analyzed in rotating fluid dynamics. E.A.K.

EVALUATION OF A METHOD FOR SHORT-RANGE FORECASTING OF EVAPORATION DUCT HEIGHTS Final Report ap HC A03/MF A01

Wayne A. Sweet Aug. 1981 40 p refs
(AD-A104892; NEPRF-TR-81-04) Avail: NTIS HC A03/MF A01 CSCL 04/2

A method for forecasting evaporation duct heights over periods of three to twelve hours is evaluated by comprising skill and threat scores to persistence scores. Although the evaluation of data from two ocean weather stations in the North Atlantic reveals an apparent advantage of the forecast method over persistence, an analysis of variance shows no statistically significant differences between the two sets of scores.

(AD-A105414; DTNSRDC/SPD-0919-01) Avail: NTIS HC A15/MF A01 CSCL 08/3

This report is a source document for specifying wind and wave conditions for those regions considered appropriate for joint operations of NATO naval forces. The areas considered are the North Atlantic Ocean northward from the Tropic of Cancer, the Mediterranean Sea, and coastal or landlocked areas such as the north, Baltic and Black Seas. The report provides seasonal and geographic distributions of wind and wave parameters and specifies mathematical models by which wave spectra, required by any ship seakeeping performance methodology, can be developed. Portions of the data are derived from the U.S. Navy's emerging Twenty Year Hindcast Wind and Wave Climatology, and are considered to be far superior to data previously available for those operating areas. HYDROCARBON COMPOSITION OF SEDIMENTS, WATER, AND FAUNA IN SELECTED AREAS OF THE GULF OF MEXICO AND SOUTHERN CALIFORNIA MARINE ENVIRONMENT Ph.D. Thesis
Paul Joseph Mankiewicz 1981 350 p
Avail: Univ. Microfilms Order No. 8121004

Predominantly sediments but also water column and faunal samples were analyzed for their hydrocarbon content using high resolution gas chromatography and gas chromatography/mass spectrometry. Seawater and geographic variability of faunal analyses appeared to be governed by feeding habit and source composition whereas water column analyses indicated a consistent petroleum component with biological contributions varying with temperature and salinity. In the nearshore areas off Texas and Louisiana the water column contained notable concentrations of petroleum in the dissolved phase, most notably alkyl naphthalenes and phenanthrenes whereas the sediments were tainted with petroleum derived from combustion sources of crude oil and refined products. In southern California, the dominant source of hydrocarbons in intertidal sediments is petroleum derived from seepage. However, in the offshore areas dated cores and surficial sediment analyses suggest that while seepage sourced petroleum is present, the dominant source of hydrocarbons is combustion derived air pollution. Dissert. Abstr.

N82-12733 State Univ. of New York at Buffalo.
LONG OCEAN WAVES ON LINEARLY VARYING BOTTOM TOPOGRAPHIES Ph.D. Thesis
Wayne Lawrence Neu 1981 67 p
Avail: Univ. Microfilms Order No. 8122192

The effects of bottom topography on long free surface gravity ocean waves were studied. Wave trapping and transmission-reflection problems are considered. The topographies are described by straight parallel bottom contours which in cross section are composed of segments of constant and linear depth variations. Over linearly varying depth segments, the solution to the vertically integrated governing equations is given in terms of two Kummer functions. Solutions were found for time harmonic waves periodic in the along contour direction and of exponential decay behavior normal to the contours over the constant depth segments. Dispersion equations relate the wave frequency to the along ridge wave number for trapped waves. The ridge and trench problems examine the portion of the incident wave energy reflected by or transmitted past the topography and the continental slope and shelf problem examines the amplication of the incident wave at the coast and resonances over the shelf. Dissert. Abstr.

BOUNDARY DETECTION CRITERIA FOR SATELLITE ALTIMETERS

C. F. Martin and R. L. Taylor Nov. 1981 61 p refs
(Contract NAS6-3075)
(NASA-CR-156880) Avail: NTIS HC A04/MF A01 CSCL 14B

A procedure for using satellite altimeter data to determine the time of crossing of a surface boundary, such as ocean land or ocean ice, with the primary objective to flag altimeter data that do not properly represent oceanographic measurements were studied. Water to land crossing and water to sea ice crossing were investigated. For ocean ice crossings, a large increase in AGC occurred. Waveform tests for increasing the probability of detecting an ocean land crossing were investigated. It is recommended that the boundary test be based on a fit of the full waveform to a limited parameter set at a rate of 5 to 10 second. E.A.K.

MARITIME SUPPORT FOR OCEAN-RESOURCES DEVELOPMENT Final Report

Jun. 1981 188 p refs
(Contract N00014-75-C-0711)
(AD-A104730) Avail: NTIS HC A09/MF A01 CSCL 08/10

The issues associated with ocean development to determine their implication for the U.S. maritime industry have been examined. The examination embraced ocean energy systems, offshore oil and gas activities, food from the sea, deep seabed mining, and the use of ocean space. The requirements that ocean-resource development places on the maritime industry do not show sharp differences from one resource to the next. While the technological base on which the means of recovery and use of the resources can be built and deployed has been developed, more scientific work and technological development are needed. However, it is the committee's opinion that the true factors pacing the effort to bring many of the resources into use and to achieve the many benefits are of an economic, legal, and public-policy nature. HIGHER PLANT ACCLIMATION TO SOLAR ULTRAVIOLET-B RADIATION Ph.D. Thesis

Ronald Robberecht 1981 109 p
Avail: Univ. Microfilms Order No. 8121390

Plant acclimation to natural and intensified solar UV-B irradiance was investigated in three species, to determine: (1) the relationship between plant sensitivity and epidermal UV attenuation, (2) the effect of phenotypic changes in the leaf epidermis, resulting from UV-B exposure, on plant sensitivity to UV radiation, and (3) the plasticity of these changes in the epidermis leading to plant, acclimation to UV-B radiation. Epidermal UV transmittance was found to differ in magnitude and spectral distribution among the three species. Photosynthesis was not significantly depressed in the leaves of any of three species. A trend toward photosynthetic depression of response to UV-B irradiation was found. A mechanism of UV-B attenuation, and increase in the UV-B attenuation capacity of the epidermis, is suggested. It is suggested that the degree of plant sensitivity and acclimation to natural and intensified solar UV-B radiation involves a dynamic balance between the capacity for UV-B attenuation and UV-radiation repair mechanism in the leaf. Dissert. Abstr.

NEUROTRANSMITTER MECHANISMS IN THE NUCLEUS ACCUMBENS SEPTI AND RELATED REGIONS IN THE RAT BRAIN

Ivar Walaas Apr. 1981 26 p refs
(NDRE/PUBL-81/1001; ISSN-0085-4301) Avail: NTIS HC A03/MF A01

The localization of different transmitter candidate, particularly the amino acids gamma aminobutyrate (GABA) and glutamate (GLU), in limbic and basal ganglia regions in the rat brain was compared and the characteristics of nucleus accumbens were studied. The GABA neurons are found in, nucleus accumbens, and GABA projections from this nucleus are identified in restricted basal forebrain and mesencephalic regions. The GLU projections from the neocortex or allocortex are terminated in nucleus accumbens and other forebrain and hypothalamic nuclei. Neurotransmitters in local neurons are identified in the hippocampus, nucleus accumbens, septurn and caudatoputamen by local kainic acid injections, while neurons in the mediobasal hypothalamus are studied after systemic treatment of newborn animals with monosodium glutamate. METHOD AND APPARATUS FOR DETECTING COLIFORM ORGANISMS Patent Application

Kenji Nishioka, David Nibley (Boeing Co., Palo Alto, Calif.), Eldon Jeffers (Boeing Co., Palo Alto, Calif.), and Richard Brooks, inventors (to NASA) (Boeing Co., Palo Alto, Calif.) Filed 26 Oct. 1981 25 p
(NASA-Case-ARC-11322-1; US-Patent-Appl-SN-315278) Avail: NTIS HC A02/MF A01 CSCL 06C

A sample containing coliform bacteria is cultured in a liquid growth medium. The cultured bacteria produce hydrogen which is vented to a second call containing a buffer solution in which the hydrogen dissolves. By measuring the potential change in the buffer solution caused by the hydrogen, as a function of time, the initial concentration of bacteria in the sample is determined. Alternatively, the potential change in the buffer solution can be compared with the potential change in the liquid growth medium to verify that the potential change in the liquid growth medium is produced primarily by the hydrogen gas produced by the coliform bacteria. AN ENGINEERING STUDY OF BACTERIAL KINETICS AND ENERGETICS Ph.D. Thesis

A. A. Esener 1981 130 p refs
Avail: NTIS HC A07/MF A01

Bacterial kinetics and energetics were studied with reference to engineering applications. Three processes were identified: (1) to biosynthetic process during which presursors are formed from the substrate followed by the polymerization of them into biomass; (2) product formation; and (3) the maintenance processes. The distribution of the input energy and mass in the form of the substrate was studied in an attempt to manipulate the distribution so as to minimize the overall cost of the product. This was accomplished by describing the whole process in terms of a mathematical model and optimizing it according to an objective function. R.J.F.

GASTROINTESTINAL ALLERGY IN THE EXPERIMENTAL ANIMAL: THE USE OF RADIOIODINATED SERUM

ALBUMIN IN THE ASSESSMENT OF NEW DRUGS Final Report, 15 Oct. 1977 - 30 Nov. 1979
S. Freier Mar. 1980 24 p refs
(IAEA-R-2067-F) Avail: NTIS (US Sales Only) HC A02/MF A01; DOE Depository Libraries

A rat model to study of gastrointestinal allergy and means to prevent it was developed. Allergic sensitivity to certain proteins by injecting proteins and adjuvants in various regimes was induced in rats. For suckling rats sensitivity was established by oral administration of the protein. A hypersensitive gastrointestinal reaction to challenge was demonstrated by electron microscopy, by light microscopy with conventional staining techniques, and by a radionuclide procedure wherein (51) Cr labelled albumin injected intravenously shortly before the challenge concentrated in the intestinal walls in rough proportion to the severity of the reaction. It is found that suppressing the hypersensitive intestinal reaction, disodium cromoglycate, dexamethazone, aspirin, indomethecan, and ipobrufen are ineffective and aminophylline was a slight amelioration. COMPILATION OF CELL DATA BANK FOR AUTOMATION IN DIAGNOSTIC CYTOLOGY Final Report
Karlheinz Otto Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 30 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-80-158; ISSN-0340-7606) Avail: NTIS HC A03/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 6,30

Automated cell recognition systems with high resolution which are required to analyze separate cells to detect cellular margins are discussed. Classified cells are used for compiling a learning data set. The preparation technique was improved, aiming at sufficient cellular isolation. In order to create a learning data set, 10,000 isolated cells were selected. The preparation procedure entails a distinct increase of isolated squamous epithelial cells and a diminution of clusters as well as white blood cells. The significance of specific and stoichiometric staining is shown. Author (ESA)

SWEATING RESPONSES OF MEN AND WOMEN DURING EXERCISE IN HUMID AND DRY HEAT Ph.D. Thesis
Andrea Jean Frye 1981 80 p
Avail: Univ. Microfilms Order No. 8120427

Four men and four women were matched on aerobic capacity and surface area to weight ratio. Each subject was acclimated to and tested in two equivalent environments (dry bulb temperature and wet bulb temperature). Maximum density of sweat gland activation (SGA sub max) was determined with the use of methacholine. Suppression of sweating due to skin hydration (hidromeiosis) was evidenced in both sexes by significantly lower total body sweat rate (m sub sw) and chest sweat rate (m sub sw) in the humid heat as compared to the dry heat. The women maintained significantly lower M sub sw and chest m sub sw than the men in the humid heat, but there were no differences in sweating rates between sexes in the dry heat. In the women, the SGA relative to SGA sub max) (% SGA sub max) was significantly higher in the dry heat than in the humid heat, SGF was similar in both environments. In the men, SGF was significantly higher in the dry heat than in the humid heat, while %SGA sub max was similar in both environments. The women were more sensitive to hidromeiosis than the men, and the nature of the response to hidromeiosis differed between the sexes.

MEDICAL DIAGNOSTIC APPLICATION OF RADIOFREQUENCY RANGE ELECTROMAGNETIC WAVES Ph.D. Thesis
Michael Raymond Millner 1981 139 p
Avail: Univ. Microfilms Order No. 8120287

A method has been developed, using a scattering or S parameter network analyzer and a loop antenna, for measuring the phase change of the forward reflection S parameter, S11, in relation to volume changes. A phantom was designed utilizing a balloon immersed in saline with displacement volume measured in a standpipe. Volume changes were related to both changes in phase and amplitude of the S11. A model was developed, based on basic electromagnetic theory, of a wave propagating through a layer of water of varying thickness bounded by air. The complex reflection coefficient was calculated, plotted, and compared to the S11 for the phantom. Several different antenna designs were tested, including varying size and types. This method was applied to the study of breathing and cardiac volume changes in man. Both the amplitude and phase of the S11 parameter were correlated with a simultaneously recorded electrocardiogram. In order to correlate these measurements with cardiac volume changes, a dog was anesthetized, and by means of the thermal dilution technique, cardiac output was determined. Dissert. Abstr.

MEASUREMENT OF THE BONE MINERAL DENSITY OF TRABECULAR BONE BY A COHERENT AND COMPTON SCATTERING TECHNIQUE Ph.D. Thesis
Shih-Shen Ling 1981 170 p
Avail: Univ. Microfilms Order No. 8120996

A simplified photon scattering method to measure the bone mineral density of the trabecular bone was studied. The method used the simultaneous detection of the coherent and Compton scattered photons from the bone sample in a narrow beam geometry. The bone mineral density is determined within the scattering volume which is defined by the configuration of the source and detector collimators and scattering angle. The size of the scattering volume is determined by the aperture diameter and the length of both the source and detector collimators for a geometric configuration, and scattering angle. The corrections to the coherent to Compton scattering ratio due to the presence of overlying tissue and the effect of fat content of the sample to this technique was also studied. A four source focused collimator was constructed to increase the incident photon intensity.
Dissert. Abstr.

THE MAGNETOSTATIC FORCE PRODUCED BY CURRENT LOOPS AND IS MEDICAL APPLICATIONS Ph.D. Thesis
Osman Kaldirim 1981 132 p
Avail: Univ. Microfilms Order No. 8120984

The magnetostatic force on permeable bodies both theoretically and experimentally was studied. Recent technological advances are tremendously advantageous to the delivery of protein carrying biologically active substances. The use of magnetic fields serves as the driving force in a guidance system to transport these substances to specific sites within the living system. Spheres of protein approximately one micron in diameter are impregnated with magnetite (Fe3O4) along with other desired substances, this combination of elements is then injected into the bloodstream. Once in the bloodstream they flow freely until the desirable site is reached. The magnetic fields and manetostatic forces which are necessary in the control of microspheres were analyzed. A theoretical analysis of the magnetostatic force due to current loops was made consisting of a systematic design and an experimental study involving the effects of magnetostatic forces on microspheres injected into animals. Dissert. Abstr.

TRANSCUTANEOUS ELECTRICAL PERIPHERAL NERVE STIMULATION: IMPLICATIONS FOR NEURAL CONTROL MECHANISMS Ph.D. Thesis

Darrell Neal Jones 1981 158 p
Avail: Univ. Microfilms Order No. 8122295

Transcutaneous electric nerve stimulation (TENS) is used clinically to control chronic pain. Large nerve fiber activity which is induced by TENS is hypothesized to inhibit pain signals at spinal levels via the gate control mechanism. While TENS is highly effective in the control of chronic pain, few additional neural function effects are reported clinically. The paucity of such observations is enigmatic since the large fiber involvement characteristic of TENS impacts numerous peripheral neural functions. A battery of performance tests was given to volunteers under control conditions and acute clinical levels of TENS. The tests included reaction time tests, force estimation tasks, touch discrimination tests and temperature discrimination tests. The results show no significant TENS effects on sensory discrimination. However, TENS significantly affects motor function, as defined by slowed reaction times and reduced range of response in force estimation. Dissert. Abstr.

THREE-DIMENSIONAL STRESS DISTRIBUTION IN ARTERIES: RADIAL COMPRESSION EXPERIMENTS OF ARTERIAL WALL; STRESS CONCENTRATION IN LUNG NEAR A CYLINDRICAL CAVITY; FINITE ELEMENT ANALYSIS OF PLEURAL SURFACE PRESSURE DISTRIBUTION IN DOG'S LUNG DURING ELECTROPHRENIC STIMULATION Ph.D. Thesis

Cheng-Jen Chuong 1981 167 p
Avail: Univ. Microfilms Order No. 8120521

A three dimensional stress strain relationship derived from a strain energy function of the exponential form was proposed for arterial wall. The effect of the nonuniform stress field in the radial direction on the water movement in arterial wall is pointed out. The elastic behavior of rabbit thoracic arteries in radial direction was studied by uniaxial compression order of magnitude of the elasticity in radial direction is the same as that in the circumferential and longitudinal directions. In the vicinity of cylindrical cavity the lung parenchyma can be subjected to very high stress concentration in the circumferential direction. Stress distributions at various infinity stretches as well as longitudinal stretches are given. During the electrophrenic stimulation the diaphragm contracts lowers and the apex t base length of the lung increase up to 25%. It is observed that reversal pleural pressure (p sub pl) gradient in which the basal p sub pl becomes more negative than the optical. This phenomena is studied by finite element method. Dissert. Abstr.

QUANTITATION OF TISSUE LOSS DURING PROLONGED SPACE FLIGHT

J. I. Leonard 24 Sep. 1979 44 p refs
(Contract NAS9-15487)
(NASA-CR-167460; TIR-74-LSP-9017) Avail: NTIS HC A03/MF A01 CSCL 06P

Data from Skylab missions related to tissue loss in space were analyzed. Significant changes in gross body composition occur during spaceflight, these include: alterations in water balance resulting from headward shifts of fluid, loss of musculoskeletal tissue, and alterations in fat depending upon the balance between caloric intake and energy expenditure. An effort was made to control the more essential components of body weight on the Skylab missions. E.A.K.

SKYLAB WATER BALANCE ANALYSIS

J. I. Leonard 13 Apr. 1977 59 p refs
(Contract NAS9-14523)
(NASA-CR-167461) Avail: NTIS HC A04/MF A01 CSCL 06P

The water balance of the Skylab crew was analyzed. Evaporative water loss using a whole body input/output balance equation, water, body tissue, and energy balance was analyzed. The approach utilizes the results of several major Skylab medical experiments. Subsystems were designed for the use of the software necessary for the analysis. A partitional water balance that graphically depicts the changes due to water intake is presented. The energy balance analysis determines the net available energy to the individual crewman during any period. The balances produce a visual description of the total change of a particular body component during the course of the mission. The information is salvaged from metabolic balance data if certain techniques are used to reduce errors inherent in the balance method. E.A.K.

IDENTIFICATION OF THE ADAPTIVE FEEDBACK OF THE HUMAN MOTOR SYSTEM USING THE RESPONSE DIFFERENCE METHOD Ph.D. Thesis

Anthonie Pieter Eland Jun. 1981 132 p refs Sponsored in part by the Netherlands Organization for the Advancement of Pure Research
Avail: NTIS HC A07/MF A01

Proprioceptive and the visual feedback of the human motor system in generating slow, goal directed movement was investigated. Two internal models are considered in the feedforward path. The sensory program specifies the expected position trajectory and its maximum velocity which explains the amplitude and the duration of the movement. The motor program is determined by the sensory program and the load's internal model and specific the amplitude and the duration of the force pattern. Learned goal directed movements are almost completely programmed. E.A.K.

OXYGEN TOXICITY AND LUNG COLLAGENOUS PROTEIN Final Technical Report, 1 Sep. 1977 - 28 Feb. 1981

Klaus Brendel and I. Glenn Sipes 28 Feb. 1981 131 p refs
(Contract N00014-77-C-0506)

(AD-A104702) Avail: NTIS HC A07/MF A01 CSCL 06/20

The chemical composition and subunit structure of the basement membrane and collagenous components of the normal lung and of lungs exposed to agents promoting the formation of singlet oxygen and thereby produce oxidative damage to tissue components was investigated. The alveolar basement membrane, the structure and composition of this component of the extracellular matrix of the lung is determined that a complex population of proteins make up the extracellular matrix. Several new collagen types are described as well as high molecular weight non collagens that appear to be associated with normal basement membranes. It is concluded that the characterization of putative changes in the nature of matrix components in pathologic states lags behind a more thorough characterization of normal basement membrance and extracellular components. E.A.K.

REPAIR OF CHEMICAL DAMAGE IN MAMMALIAN CELLS
R. B. Setlow 1981 10 p refs Presented at the NATO CNEN Conf., Rome, 24 Aug. - 5 Sep. 1981 Submitted for publication
(Contract DE-AC02-76CH-00016)
(DE81-030823; BNL-30055; B10-3767; CONF-810873-1)
Avail: NTIS HC A02/MF A01

The repair of chemical damage to DNA is discussed. Most chemicals of environmental concern do not react directly with cellular macromolecules but must first be activated to nucleophiles. The different reactivities between agents reacting directly and those that react indirectly may produce products whose yields as a function of dose are completely different even though the products themselves may be the same. Nucleotide excision measurements of DNA repair are used extensively to detect agents that react with DNA which measurements help identify dangerous DNA adduct. The chemical damages that mimic UV are repaired by nucleotide excision, and the chemicals give rise to bulky adducts. The excision repair of bulky DNA adducts mimics the repair of UV damage in many ways, however the identity of the repair pathways is still controversial. DOE

STUDIES IN ERYTHROPOIESIS: THE INFLUENCE OF THE GLYCOCALYX OF THE RED CELL MEMBRANE Ph.D. Thesis
M. W. Franco 1980 148 p refs
(Contracts DE-AS05-76EV-04157; EY-76-S-05-4157)
(DE81-030668; DOE/EV-04157/T3) Avail: NTIS HC A07/MF A01

The correlation between the removal from the circulation of aged cells and the production of new RBCs was investigated. An erthropoietic influence was associated with the glycocalyx of the erythrocyte membrane. The influencing factor, asialoglycophorin, was masked on the young RBC by an amino ketosugar, sialic acid. During the aging process, an increasing amount of sialic acid is removed from the membrane to expose the underlying erythropoietic message. The amount of erythropoietic activity was directly related to the number of desialated erythrocytes transfused and to the degree of desialation of the transfused erythrocytes. It is shown that asialoglycophorin is an erythrocyte stimulating factor following its isolation from the membrane and subsequent injection into test mice and both mouse and human asialoglycophorin and stimulatory. MEASUREMENT OF GONADAL AND BONE-MARROW DOSES FROM DENTAL RADIOGRAPHY
S. B. Solomon and N. D. Morris Jun. 1980 30 p
(ARL/TR-022; ISSN-0157-1400) Avail: NTIS (US Sales Only) HC A03/MF A01; DOE Depository Libraries

The method of calculation of the radiation doses to the gonads and to the active bone marrow arising from dental radiography is described. The bone-marrow doses have been calculated using a computer model of X-ray depth doses within the skull for typical dental radiographic examinations as performed in Australia. The ovarian and testicular doses, as a percentage of skin dose have been determined experimentally. The dependence of the gonadal doses on X-ray tube voltage, face to cone distance and direction of the X-ray beam relative to the face is detailed. DOE

IDENTIFICATION AND TOXICITY OF FRACTIONATED-SHALE-OIL COMPONENTS

K. Wittnebel, D. C. Shelly, C.-N. Ho, I. M. Warner, and J. M. Quarles 1981 17 p refs
(Contract DE-AS05-80EV-10404)
(DE81-028460; DOE/EV-10404/T1) Avail: NTIS HC A02/MF A01

A procedure for the separation and identification of polynuclear aromatic hydrocarbons (PNAs) is presented. This procedure comprises two steps. First, the shale oil is separated into fractions according to ring size on a Chromosorb LC-9 normal phase column. Then each of these fractions are separated into individual components and identified using an analytical reversed-phase Ultrasphere ODS 5 micrometer column. In addition, toxicity studies are carried out on each fraction obtained from the amine column to indicate which class of PNAs warrants special attention and analysis. The results of this approach are reported. T.M.

THRESHOLDS OF HEARING BY AIR CONDUCTION AND BY BONE CONDUCTION UNDER DIFFERENT MASKING CONDITIONS

M. S. Shipton and D. W. Robinson Jun. 1981 46 p refs
(NPL-Ac-100; ISSN-0143-7143) Avail: NTIS HC A03/MF A01

Air and bone conduction threshold determinations for 152 subjects in the age range 16 to 30 years are presented. Bone conduction tests were carried out using a vibrator applied to the left and right mastoid under three conditions at the contralateral ear: unoccluded, masked at 25 dB, and at 40 dB sensation level. By a systematic process of otological classification of the subjects, the bone conduction threshold for normal hearing was estimated with an uncertainty of less then 1 dB and was interpolated for masking noise levels from zero to 40 dB sensation level. Individual air-bone gaps are shown to be widely spread for an otologically normal group, but distributions are normal and have a mean value close to zero. Author (ESA)

N82-12769# National Physical Lab., Teddington (England). Acoustics Unit.

AN INVESTIGATION OF THE STATUS OF BONE CONDUCTION AUDIOMETER CALIBRATION IN THE NATIONAL HEALTH SERVICE

G. R. Torr and L. S. Whittle Jun. 1981 45 p refs
(NPL-Ac-101; ISSN-0143-7143) Avail: NTIS HC A03/MF A01

The accuracy and uniformity achieved in the calibration of bone conduction audiometers used in hospitals were studied. The acceleration output of precalibrated bone vibrator supplied as part of an audit kit was measured. the precalibration of the bone vibrator is on the order of 2 dB at all test frequencies, although the differences between the individual results and precalibration attained 5 dB at extreme frequencies in a few cases. However, differences are substantially reduced by reinterpreting the hospital measurements using determinations of the sensitivities of the artificial mastoids and by correcting the measurements to a common temperature. DAMAGE RISK CRITERIA FOR IMPULSE NOISE

G. F. Smoorenburg 1980 35 p refs Presented at Intern. Symp. on New Perspectives on Noise Induced Hearing Loss, Cazenovia, New York, 15-18 Jun. 1980
(Contract A76/K/103)
(IZF-1980-26; TDCK-75018) Avail: NTIS HC A03/MF A01

Data on temporary threshold shifts (TTS) due to impulse noise exposure are evaluated. Peak levels of the impulses are determined at which only 10% of the people exposed show TTS, two minutes after exposure, of 15 dB or more averaged over the threshold shifts at 1, 2, and 3 kHz (TTS 1, 2, 3 > 15 dB). These peak levels are a function of the number of impulses per exposure times the duration of a single impulse. The result is compared with TTS data on steady noise as a function of exposure duration, and with data on permanent threshold shifts (PTS) induced by impulse and intermittent noise. This suggests that < 10% of the people exposed to impulse noise each working day will develop noise induced PTS 1, 2, 3 of 15 dB or more if the equivalent level of the noise is 85 dB. The hearing loss fence of 15 dB PTS 1, 2, 3 is discussed for loss of speech discrimination in a noisy background and it is shown that a higher fence cannot be allowed. The attenuation from ear plugs is less than laboratory values. Author (ESA)

PILOT ESTIMATES OF GLIDEPATH AND AIM POINT DURING SIMULATED LANDING APPROACHES

C. W. Acree, Jr. Nov. 1981 21 p refs
(NASA-TM-81325; A-8717) Avail: NTIS HC A02/MF A01 CSCL 05I

Pilot perceptions of glidepath angle and aim point were measured during simulated landings. A fixed-base cockpit simulator was used with video recordings of simulated landing approaches shown on a video projector. Pilots estimated the magnitudes of approach errors during observation without attempting to make corrections. Pilots estimated glidepath angular errors well, but had difficulty estimating aim-point errors. The data make plausible the hypothesis that pilots are little concerned with aim point during most of an approach, concentrating instead on keeping close to the nominal glidepath and trusting this technique to guide them to the proper touchdown point. HOW TO DISPLAY DIGITAL SONAR SIGNALS. SOME PRIMARY THRESHOLD MEASUREMENTS

A. vanMeeteren and A. F. Sanders 1979 20 p refs
(Contract A73/KM/032)
(IZF-1979-16; TDCK-73399) Avail: NTIS HC A02/MF A01

The optimal task division between operator and computer when trying to identify echoes in sonar observation of a noisy field is discussed. Confidence ratings defined four criteria, ranging from sure no target to sure target, and results were scored as d values as a measure of detectability at the different criteria. The d values are higher towards the sure target end of the range. There are significant differences between subjects, but none for interactions between subjects and display variables. It is found that at high display thresholds the intensity mode works best, whereas at display the length mode is superior regarding target detection. Author (ESA)

CONSPICUITY OF OBSERVATION POSTS AT THE AIR WEAPON FIRING RANGES ON THE VLIEHORS AND THE NOORDVAARDER

J. Boogaard, J. Varkevisser, and J. J. Vos 1979 20 p ref
Transl. into ENGLISH of 'Opvallendheid van observatieposten op de schietranges of de Vliehors en de Noordvarrder' Soesterberg, Netherlands
(Contract A78/KLu/058)
(IZF-1979-33-E; TDCK-73411) Avail: NTIS HC A02/MF A01

Visibility from the air of observation posts is examined in order to decrease the likelihood of their being mistaken for targets. Subjective assessments by tower personnel and pilots indicate that a yellow/black check pattern has no advantages for recognition. A scale model was used to test other color/pattern combinations and the effect of a marker beacon on the tower. Results show that: (a) visibility is improved by lights of 5 million cd, while higher values cause uncomfortable glare; (b) towers should be painted black; and (c) approach route must be clearly marked. However, tower staff fear that these measures will increase danger by making them too obvious a 'target', especially in poor visibility. Author (ESA)

CYBERNETICS AND CAR DRIVING: A MATHEMATICAL (COMPUTER) MODEL FOR THE SYSTEM TO BE CONTROLLED

G. J. Blaauw 1980 27 p refs
(IZF-1980-4; TDCK-75004) Avail: NTIS HC A03/MF A01

A mathematical representation of the system controlled by a car driver is presented. This system is defined by combinations of lateral and longitudinal vehicle dynamics, course following, and the execution of an arbitrary additional task. A linearized model is developed and implemented in subroutines on a digital computer. The model based on control theory uses state vector notation. The description results in a six-dimensional state vector and involves three lead variables (course of the road, velocity of the lead car and the stimulus of the additional task) and one disturbance variable (side-wind gusts or road irregularities). The routines calculate future values for the course of the road and the velocity of the lead car in order to make anticipation possible by the driver. Driver's actions are modeled by the position of the accelerator, the brake force and the steering wheel angle. Several routines are extended with additional procedures to allow for an independent use in other applications. For example, the mathematical representation of the vehicle dynamics is extended with nonlinear equations to cover the complete range of variables and can be used in specific studies of the effects of vehicle parameters. CYBERNETICS AND CAR DRIVING: A DRIVER MODEL AND ITS EXPERIMENTAL VALIDATION

G. J. Blaauw 1980 15 p refs
(IZF-1980-13; TDCK-75012) Avail: NTIS HC A02/MF A01

A linearized mathematical model which describes and predicts driver behavior is introduced. The internal representation consists of an estimation of the state vector describing the system to be controlled. The supervisory structure of the driver is studied by considering lateral and longitudinal control, combined with variations in bandwidth and energy of the lead variables. Car following and course following are included so that driver anticipation can be modeled by the observation of future values of the course of the road and the lead car velocity. A lead variable for the stimulus of an additional task can be included. Model validity is demonstrated by analyzing the effects of variables (driving experience, system disturbances, etc.) on the model parameters. Author (ESA)

LEVELS OF STEERING CONTROL: REPRODUCTION OF STEERING WHEEL MOVEMENTS

J. Godthelp 1980 36 p refs
(IZF-1980-16; TDCK-75014) Avail: NTIS HC A03/MF A01

A schematic description of the driving control process using levels of control, i.e., precognitive, pursuit, and compensatory, is presented. The efficiency of the higher levels of control depends on the accuracy of internal information (knowledge of the road, the car, etc.) plus proprioceptive feedback. The sensitivity of the proprioceptive system was analyzed by measuring subjects' accuracy when asked to reproduce steering wheel positions without visual feedback. For discrete positions, standard deviation increases with steering wheel angle amplitude. However, relative errors are greatest with small angles. Steering force reduces the variation in reproduction. For continuous movements, reproductions are less accurate with low movement velocity than for the discrete positions. An additional velocity overshoot occurs. Rapid movements show higher positioning accuracy than slow. Author (ESA)

CYBERNETICS AND CAR DRIVING: PERSPECTIVE PERCEPTION AND THE OUTPUT VECTOR OF THE SYSTEM TO BE CONTROLLED

G. J. Blaauw 1980 22 p refs
(IZF-1980-19; TDCK-75008) Avail: NTIS HC A02/MF A01

A sensitivity analysis for the perspective perception of lateral position variations during course following and distance variations during car following is covered. Variations in the curvature of the road followed are also considered via a perspective transformation. The sensitivities are derived for the development of a cybernetical model to describe and predict driver behavior quantitatively. The curvature variations are related to the most substantial element of the lead vector. The sensitivity for lateral position variations distinguishes between guidance features (lane markers, postmounted delineators, public lighting, etc.). The sensitivities for distance variations are related to the angular perception of the lead car dimensions and the road interval between lead car and own vehicle. The derived transformation equations are combined into one display equation which represents the transformation of the variables involved in the system to be controlled and models the output vector of that system as input information for the driver. THE EFFICIENCY OF DETECTING TRIBAR PATTERNS MODULATED IN RANDOM DOT DENSITY

R. T. Flaherty (Night Vision and Electro-Optics Labs.) and A. VanMeeteren 1980 15 p refs
(IZF-1980-25; TDCK-75020) Avail: NTIS HC A02/MF A01

The ability of the visual system to resolve detail, and to integrate information over area in threshold measurements with tribar targets is examined. Frequency-of-seeing curves were measured for the detection of tribar patterns modulated in the density of computer generated random dot distributions. Comparison of actual and ideal results shows that the visual system uses only 22% of the available information in detecting tribar targets. For long presentation times of 1 sec no difference

in efficiency is found for targets of 1 deg X 1 deg and 10 deg X 10 deg. However, for short presentation times of 0.2 sec, the efficiency is about 40% lower for the 10 deg targets. This suggests that the field of view for pattern integration in one glimpse is smaller than 10 deg X 10 deg. Contrast sensitivity functions measured with tribar targets comprise a component for spatial integration inversely proportional to spatial frequency.

REVIEW OF HUMAN AND OPERATIONAL FACTORS AFFECTING THE FEASIBILITY OF THE SEE-AND-AVOID CONCEPT
Otto Weber May 1981 52 p refs
(DFVLR-Mitt-81-13) Avail: NTIS HC A04/MF A01; DFVLR, Cologne DM 12,30

Theoretical analysis and flight test assessments of the see-and-avoid concept of accident prevention are discussed. The international definition of visibility is supplemented by maximum detection range (MDR) and horizontal standard visibility (HSV). The MDR is always significantly lower than the HSV. Representations from design eye reference points show that cockpit visibility is often poor, especially for light, and small jet, aircraft when flying a horizontal turn. The introduction of speed dependent visual flight regulations is recommended. Author (ESA)

CLOSE-RANGE CINE-PHOTOGRAMMETRY: A GENERALIZED TECHNIQUE FOR QUANTIFYING GROSS HUMAN MOTION Ph.D. Thesis
James Stephen Walton 1981 648 p
Avail: Univ. Microfilms Order No. 8120471

New cinematographic techniques for performing two and three dimensional analyses are described. Transformations between object coordinates and image coordinates were developed. The techniques are similar to those employed in analytical photogrammetry. Applications of the generalized three dimensional technique require information from a minimum of two distinct views. Applications of the generalized planer technique can e made using information from a single camera. A refined version of the generalized three dimensional technique is also described. This corrects for lens distortions and linear film deformations. It is shown that, using object distances of approximately 35 feet, the center of a golf ball can be located to within .1 inch of its true, three dimensional location. The acceleration of the center of mass of a spinning, yet freely falling frampolinist is determined and compared with the acceleration due to gravity.

AN INVESTIGATION INTO PILOT AND SYSTEM RESPONSE TO CRITICAL IN-FLIGHT EVENTS. VOLUME 1: EXECUTIVE SUMMARY Final Report
Thomas H. Rockwell and Walter C. Griffin [1981] 199 p refs
(Contracts NAS2-10047; NAG2-75)
(NASA-CR-164993) Avail: NTIS HC A09/MF A01 CSCL 05H

Critical in-flight events (CIFE) that threaten the aircraft were studied. The scope of the CIFE was described and defined with emphasis on characterizing event development, detection and assessment; pilot information requirements, sources, acquisition, and interpretation, pilot response options, decision processed, and decision implemetation and event outcome. Detailed scenarios were developed for use in simulators and paper and pencil testing for developing relationships between pilot performance and background information as well as for an analysis of pilot reaction decision and feedback processes. Statistical relationships among pilot characteristics and observed responses to CIFE's were developed. R.J.F.

AN INVESTIGATION INTO PILOT AND SYSTEM RESPONSE TO CRITICAL IN-FLIGHT EVENTS. VOLUME 2: APPENDIX
Thomas H. Rockwell and Walter C. Griffin [1981] 150 p refs
(Contracts NAS2-10047; NAG2-75)
(NASA-CR-164994) Avail: NTIS HC A07/MF A01 CSCL 05H

Materials relating to the study of pilot and system response to critical in-flight events (CIFE) are given. An annotated bibliography and a trip summary outline are presented, as are knowledge surveys with accompanying answer keys. Performance profiles of pilots and performance data from the simulations of CIFE's are given. The paper and pencil testing materials are reproduced. Conditions for the use of the additive model are discussed. A master summary of data for the destination diversion scenario is given. An interview with an aircraft mechanic demonstrates the feasibility of system problem diagnosis from a verbal description of symptoms and shows the information seeking and problem solving logic used by an expert to narrow the list of probable causes of aircraft failure. USER'S GUIDE TO BIODYN-80: AN INTERACTIVE SOFTWARE PACKAGE FOR MODELING BIODYNAMIC FEEDTHROUGH TO A PILOT'S HANDS, HEAD AND EYES Final Report, Jan. 1979 - Oct. 1980
Susan A. Riedel, Raymond E. Magdaleno, and Henry R. Jex
Jul. 1981 70 p refs
(Contract F33615-79-C-0519; AF Proj. 2312)
(AD-A104933; STI-TR-1146-1) Avail: NTIS HC A04/MF A01 CSCL 06/6

An interactive computer program (BIODYN-80) for solving the dynamic motion response of seated aircrew (pilots or equipment operators) working in a biodynamic environment (such as vibration or changing levels of acceleration in aircraft, surface vehicles, or motion simulators) is described. The multi-degree-of-freedom, lumped-parameter model includes elements for: pelvis, torso, neck, head, eyes, upper and lower arms, hand-grip and control stick (center-stick with arm rest). The nonlinear equations of motion of the body's main elements are linearized about a general set of body-limb-head postures, ranging from prone, to erect, to supine. Typical parameter ranges and sources are given, along with two 'typical' sets: a seated-pilot with center-stick, and a seated produce biomechanical transmissability files needed for use in the Air Force's PIVIB program for tracking performance estimation. Procedures and examples are given for both a Cyber 175 version and a PDP-10 version. GRA

HUMAN CONTROL AND REGULATION TASKS [MENSELIJKE STUUR-EN REGELTAKEN]
C. L. Ekkers, A. A. F. Brouwers, C. K. Pasmooij, and P. M. deVlaming Delft Netherlands Organization for Applied Scientific Research TNO Sep. 1980 246 p refs In DUTCH
Avail: NTIS HC A11/MF A01

The effects of technological development, defined as automation, on the nature and quality of human work in industrial process control systems and computer systems were investigated. Twenty four man machine systems with different degrees of automation and complexity were compared for characteristics of technical, organizational and individual tasks. It is noted that sharing of tasks between man and machine is more unfavorable at higher levels of automation. The operator's abilities are only occasionally utilized and the opportunity to do meaningful work is limited. Teamwork is more positive, but it limits the individual operator's autonomy, even more in highly automated systems. In administrative computer systems, the routine nature of the work and its rigid procedures are considered negative. A clear correlation is found between these problems, job satisfaction and sickness rate. Author (ESA)

OPTIMAL SYNCHRONIZATION FOR A DISTRIBUTED DATABASE Ph.D. Thesis
Robert Joel Hofkin 1981 133 p
Avail: Univ. Microfilms Order No. 8120528

A protocol for the synchronization of transactions in a distributed database management system is described. This protocol, called GUS, uses a completely distributed control mechanism, and quarantees the equivalent of a first-come, first-served order of transaction processing. Two measures of communication costs: the number of messages sent, and the time delay in transmission, are used to evaluate the performance of synchronization protocols. The GUS is compared to several other protocols used in distributed database sytems, and also to the theoretical lower bounds for the two costs. In the best case GUS achieves both lower bounds. The GUS is always faster, and requires fewer messages than the other distributed synchronization protocols. The basic GUS protocol uses no acknowledgement messages, but instead relies upon characteristics of the communication medium to achieve improved performance. The problem of communication and site failure is reviewed. Interprocess communication is abstracted by a local capability model; this model facilitates the design of distributed systems using standard finite-state analysis. Dissert. Abstr.

NUMERICAL EXPERIMENTS FOR SOLVING SYMMETRIC HYPERBOLIC SYSTEMS WITH DISCONTINOUS INITIAL DATA Ph.D. Thesis
Yi-Ling Fan Chiang 1981 264 p
Avail: Univ. Microfilms Order No. 8122058

Numerical experiments were performed to observe the rate of weak convergence in applying difference schemes to linear, symmetric, hyperbolic problems with discontinuous initial data.

At a fixed time, the discrete solution as a function of the space variable may be viewed as decomposed into adjacent smooth regions and neighborhoods of discontinuity. In the smooth regions, the rate of convergence is the order of the scheme and is independent of the preprocessing technique. In the neighborhoods of discontinuity, for problems with constant coefficients, the rate of convergence is the minimum order to the employed scheme and the preprocessing technique. For problems with variable coefficients, the expected rate of convergence was never observed. Within reasonable limits on the mesh size, the asymptotic behavior of the solution is not achieved. Furthermore, the characteristic speed plays an important role in both the rate of convergence and the accuracy of the approximation. The measure of the L sub 2-underestimate is also studied. Dissert. Abstr.

DEFERRING UPDATES IN A RELATIONAL DATA BASE SYSTEM

Stephanie Cammarata Jun. 1981 26 p refs Presented at the 7th Intern. Conf. on Very Large Data Bases, France, Sep. 1981; sponsored by the Inst. National de Recherche en Informatique et en Automtique
(P-6634) Avail: NTIS HC A03/MF A01

Deferred updating in a relational data base is a technique which delays the application of updates until a request is made for the value. In general we do not know, a priori, which of the updated values will be retrieved; therefore; it is beneficial to defer the access and computation. This technique promotes an 'update-by-need' policy. The method uses generalization, property inheritance, and procedural attachment for dynamically maintaining the update and query processes. The use of these representational concepts aids in maintaining the structure of the relational model, yet provides opportunities to extend the semantic power of the model. Author

NEW SCHEDULER FOR JOB PROCESSING IN COMPUTER SYSTEMS

Masako Tuchiya, Kazuyo Suematsu, Masahiro Yoshida, and Shigeki Hatayama 1981 60 p refs In JAPANESE; ENGLISH summary
(NAL-TR-659; ISSN-0389-4010) Avail: NTIS HC A04/MF A01

The job processing method in computer systems is discussed. The conventional scheduler is criticized and it is pointed out that utilization of the central processing unit (CPU) is too sensitive to the input job-stream. This is the reason it is difficult to retain constantly high CPU utilization in keeping with the increasing throughput of the short job-class. A job processing method to solve this problem, the job/job-step scheduler, is proposed. The main concept is to schedule a job or a job-step so that a number of so-called CPU-bound job-steps may be in a state for immediate processing by CPU. In order to make the new scheduling possible, the operating systems must have the following job-processing capability: all job-steps setting up the job shall not necessarily be processed sequentially; it should be possible to halt the job processing temporarily at some job-step stage for preparation of the pool of CPU-bound job-steps. The skeleton of the simulator which was programmed to evaluate the performance of the job/job-step scheduler in an application for job processing with the NAL computer system is described. The results of the simulation experiment are given to illustrate the effectiveness of the proposed scheduler. B.W.

NONLINEAR REAL-TIME OPTICAL SIGNAL PROCESSING

Final Report, 14 Apr. 1977 - 14 Apr. 1981

A. A. Sawchuk, T. C. Strand, and A. R. Tanguay, Jr. 30 Jun. 1981 84 p refs
(Grant AF-AFOSR-3285-77; AF Proj. 2305)
(AD-A105186; USCIPI-1020; AFOSR-81-0650TR) Avail: NTIS HC A05/MF A01 CSCL 14/5

The results of a four year research program in nonlinear real time optical signal processing are described. The goal of the program was to extend fast parallel nonlinear operations to optical processing systems with large time bandwidth and space bandwidth products. Real time homomorphic and logarithmic filtering by halfonte nonlinear processing has been achieved. A detailed analysis of degradation due to the finite gamma and other nonideal effects of the recording medium has been completed along with an extensive study of techniques for precompensating these effects. Further improvements in experimental work await a liquid crystal light valve (LCLV) or other real time spatial light modulator with a sharper threshold and better uniformity and repeatability. A direct nonlinear technique of real time parallel A/D conversion of an incoherent optical image has been developed. A detailed theoretical analysis and modeling of liquid crystal devices and associated photoconductors was completed, providing an excellent fit to experimental data obtained on several devices provided by Hughes Research Laboratories. These results have been used to make a flexible multiple light valve system (MLVS) in which the form of the nonlinearity can be varied. GRA

THINKING ABOUT LOTS OF THINGS AT ONCE WITHOUT GETTING CONFUSED: PARALLELISM IN ACT 1

Henry Lieberman May 1981 24 p refs
(Contracts N00014-75-C-0522; N00014-80-C-0505)
(AD-A104965; AI-M-626) Avail: NTIS HC A02/MF A01 CSCL 06/4

As advances in computer architecture and changing economics make feasible machines with large-scale parallelism, Artificial Intelligence will require new ways of thinking about computation that can exploit parallelism effectively. We present the actor model of computation as being appropriate for parallel systems, since it organizes knowledge as active objects acting independently, and communicating by message passing. We describe the parallel constructs in our experimental actor interpreter Act 1. Futures create concurrency, by dynamically allocating processing

resources much as Lisp dynamically allocates passive storage. Serializers restrict concurrency by constraining the order in which events take place and have changeable local state. Using the actor model allows parallelism and synchronization to be implemented transparently, so that parallel or synchronized resources can be used as easily as their serial counterparts.

SOLUTION OF NONLINEAR STRUCTURAL PROBLEMS USING ARRAY PROCESSORS
Nesrin Sarigul, Jacek Maitan, and Hussein Kamel 20 Aug. 1981 30 p refs Presented at 1981 FENOMECH, Stuttgart, 25-28 Aug. 1981
(Contract N00014-75-C-0837; NR Proj. 064-531)
(AD-A104987; TR-8) Avail: NTIS HC A03/MF A01 CSCL 09/2

The paper describes ongoing efforts to investigate the usefulness of so called 'attached processors' or 'array processors', combined with mini-and superminicomputers, in the analysis of computationally demanding engineering problems; such as, in finite element nonlinear applications. A close examination of some basic algorithms, which play an important part in such analysis, is presented. Furthermore, a methodology is developed, which forms a useful guide to further efforts of this nature, including the more general case of multiprocessing. An emphasis is made on the ability to predict the performance of algorithms from time measurements of certain basic operations, coupled with an understanding of the characteristics of the hardware in question and the interplay between its various components. Four hardware alternatives are considered, two of which have attached array processors. Of the algorithms considered, it appears that the decomposition process is the one which benefits most from the presence of an array processor. The speed advantage gained in stiffness assembly, and forward and backward substitution may both be obtained by purchasing a more powerful superminicomputer.

UNIX NSW FRONT END ENHANCEMENTS, VOLUME 1 Final Technical Report, Jan. - Oct. 1980
Robert H. Thomas, Hendrik O. Lind, and Stephen G. Toner Griffiss AFB, N.Y. RADC Jun. 1981 203 p refs
(Contract F30602-80-C-0062; AF Proj. 5581)
(AD-A105035; BBN-4571-Vol-1; RADC-TR-81-164-Vol-1) Avail: NTIS HC A10/MF A01 CSCL 09/2

The effort to develop a UNIX NSW Front End is part of the National Software Works (NSW) program sponsored jointly by the Air Force and ARPA. The goal of the NSW program is to develop a network operating system (called the NSW system or NSW for short) that provides an effective environment for software production, software configuration control, and software maintenance. Users access the National Software Works system by means of an NSW Front End. The objective of the UNIX NSW Front End project was to develop an NSW Front End that runs on a DEC PDP-11 computer under the UNIX operating system.

DEVELOPMENT OF ELEMENTAL ANALYZER TO PROGRAMMABLE CALCULATOR INTERFACE
Fred W. Postma, Jr. Sep. 1981 58 p refs
(Contract W-7405-eng-26)
(DE82-000895; K-2026) Avail: NTIS HC A04/MF A01

A solid state electronic interface was designed and constructed. It relieved the analyst of the responsibility for measuring changes in the pen position on the strip chart and for performing the calculations during the analysis and weighting period. A program was written to calculate blanks, standard factors, and sample weight fractions for nitrogen, carbon, and hydrogen. The interface passed data from a Pepkin-Elmer Elemental Analyzer to a Texas Instruments TI Programmable 59 pocket calculator and printer.

DEVELOPMENT OF MOS MEMORIES Final Report
Hans Moormann, Helmut Mueller, Adolf Scheibe, Jacobus Scholtens, and Hartmut Schrenk Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 220 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-80-161; ISSN-0340-7608) Avail: NTIS HC A10/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 38.50

The designs were adjusted to the production process in such a way that modules with higher reliability and performance can be manufactured. Key technology developments were: the double-poly-Si technique, the varactor MOS technique, and the floating gate technique. Two of the memories are high density 16 Kbit and 64 Kbit random access memories. Three are nonvolatile unprogrammable memories: a 256 bit television station memory, an 8 Kbit electrically alterable read-only memory (ROM) and a 16 Kbit optically erasable ROM. Three are ROM's with 8, 16 and 32 Kbits.

BENORSY: A FORMALIZED INSTRUMENT FOR THE USER ORIENTED REVISION OF DP-SYSTEMS Final Report
Heidrun Essig, Hanns-Wilhelm Heibey, Michael Kuehn, and Arno Wolf Bonn Bundesministerium fuer Forschung und Technologie Jan. 1981 190 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-DV-81-001; ISSN-0170-9011) Avail: NTIS HC A09/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 35.30

User studies in data processing and social sciences are reviewed. The approach is based on two equally necessary assumptions for user oriented data processing systems: (1) a framework for user interactive systems, showing the problem areas important to the user and forming a foundation for technical oriented design instruments; and (2) user participation helping with this framework in practice. BENORSY, consisting of ANALYZE which determines the causes of low user compatibility and BESCHREIBUNG which describes the actual and desired situation of computer aided work systems transparently, was implemented in a participative project organization.

EFFICIENT IMPLEMENTATIONS OF MULTICOUNTER MACHINES FOR OBLIVIOUS TURING MACHINES, ACYCLIC LOGIC NETWORKS, AND VLSI
P. M. B. Vitanyi May 1981 24 p refs Submitted for publication
(MC-IW-167/81) Avail: NTIS HC A02/MF A01; Stichting Mathematisch Centrum, Amsterdam FL 3.15

The dependence of the required time and storage, to maintain counts, on storage structure and organization as well as the cost required by a combinatorial network are investigated. Results show that a one-tape oblivious Turing machine can simulate a k-counter machine on-line in linear time and logarithmic space. This leads to a linear cost combinational logic network implementing n steps of a k-counter machine. In the VLSI model of computation it is possible to simulate n steps of a k-counter machine in real time on area Omicron (k log n). A k-counter machine can be simulated in real time by a nonoblivious machine without head reversals. Results are also stated for oblivious k-counter languages. Author (ESA)

EVALUATION OF MICROPROCESSORS FOR PROCESS CONTROL APPLICATIONS Ph.D. Thesis
Thomas Edgar Dickey 1981 484 p
Avail: Univ. Microfilms Order No. 8116789

A procedure is developed for rating different microprocessors in terms of the relative difficulty of programming them for the same process control application in assembly language. The procedure is based on measuring the logical complexity of each microprocessor's instruction repetoire. A simple experiment is performed to test this procedure by programming a set of five kernel programs which are representative of typical tasks performed in a digital process control system. These kernel programs were coded for six different commercially available microprocessors. The kernel program development time and the complexity measure are very strongly correlated. Dissert. Abstr.

DYNAMIC PROGRAMMING FOR PROBLEMS OF IMPULSE CONTROL Ph.D. Thesis
Armand Maurice Makowski 1981 255 p
Avail: Univ. Microfilms Order No. 8121612

The ideas and techniques are illustrated on two typical samples, namely a general problem of optimal stopping and a problem of inventory control with jump process input. The emphasis is on obtaining local necessary and sufficient optimality conditions; they take the form of a generalized (quasi-) variational inequality associated with the weak infinitesimal generator of a semigroup of conditioned shifts, generated by the flow of information. The analysis revolves around the study of a quantity--the auxiliary value function--which completely characterizes optimality and is differentiable in some semigroup sense. For both problems investigated this differentiability is directly established by computing various Lipschitz-like estimates for the auxiliary value function. Dissert. Abstr.

SISU: A PROGRAMMING LANGUAGE FOR COMPUTATIONAL LINGUISTICS, WITH AN APPLICATION TO THE ANALYSIS OF FINNISH Ph.D. Thesis
Irving David Woolf 1981 422 p
Avail: Univ. Microfilms Order No. 8118659

A programming language for Computational Linguistics (CL), is described. Natural-language processing and CL application areas and examples are examined to develop a list of requirements for such a programming language. The SISU language was developed to meet those requirements. A large number of features to simplify the construction of CL are provided. Command and data abstractions to facilitate handling blocks of text, sentences and words by referring to them as just that-text, sentences and words are reviewed. A number of commands which operate on individual words for the purpose of morphemic analysis, allowing the words to be easily taken apart, examined and altered are provided. A facile dictionary-building and referencing technique is also included, as well as debugging and text output features. Dissert. Abstr.

SINGULAR PERTURBATION MODELING AND ITS APPLICATION TO FAST ALGORITHMS OF CHANDRASEKHAR TYPE Ph.D. Thesis
George Panayiotou Syrcos 1981 153 p
Avail: Univ. Microfilms Order No. 8122132

The state equations of a large scale, time invariant model are converted to singularly perturbed form. Classification of the physical states as slow and fast is accomplished. The use of the Chandrasekhar algorithm in a singularly perturbed type of environment is addressed. A Chandrasekhar algorithm for singularly perturbed systems is developed and the structure of the solution is analyzed. The developd theory is applied to the design of the linearized F-100 turbofan engine. Dissert. Abstr.

N82-12811 Rutgers - The State Univ., New Brunswick, N. J.
RESTRUCTURING COBOL PROGRAMS TO IMPROVE READABILITY Ph.D. Thesis
Bobbie Ann Fredsall Othmer 1981 229 p
Avail: Univ. Microfilms Order No. 8122108

The problem of restructing programs for enhanced readibility from both a theoretical and empirical point of view is examined. Program readability is defined in terms of the information processing model of memory. In order to evaluate the efficacy of the restructuring algorithms presented, a six component readability measure is developed. Program structures and rules for the use of control structures advocated by adherents of structured programming are considered in choosing a form for the target of the restructuring process. Four forms were chosen for examination. They all use the repeat-loop with multilevel exists as the loop control structure. Restructuring algorithms for achieving each form from a control flow graph are presented. For a given program, the restructured version is unique or almost unique if certain desirable properties are required. The uniqueness is independent of the algorithm used for restructuring, and thus restructuring using only syntactic information has intrinsic limitations. Examples of the restructuring of several production programs are given. Dissert. Abstr.

N82-12812 University of Southwestern Louisiana, Lafayette.
DESIGN AND CONSTRUCTION OF A VIRTUAL MACHINE RESOURCE BINDING LANGUAGE Ph.D. Thesis
Scott Davidson 1980 254 p
Avail: Univ. Microfilms Order No. 8121477

A machine independent solution of the resource binding problem, a high level language incorporating this solution, the implementation of this language, and experiments conducted with the language are investigated. The Virtual Machine Resource Binding Language (MARBLE) solves the resource binding problem. The implementation of MARBLE is designed for the class of microprogrammable architectures. The solution to the resource binding problem consists of modelling target virtual machine resources by machine independent source language constructs. In MARBLE target data resources are modelled by type definitions. These models can be bound to the appropriate target resource through the use of a source language construct. All MARBLE programs are machine independent. Dissert. Abstr.

VELOCITY-SPACE SYNTHESIS OF ISEE-1 MEASUREMENTS OF THE THREE DIMENSIONAL ELECTRON DISTRIBUTION FUNCTION
R. J. Fitzenreiter and Jack D. Scudder Oct. 1981 37 p refs
(NASA-TM-83838) Avail: NTIS HC A03/MF A01 CSCL 09B

A computer package which produces contour plots of the three dimensional electron distribution function measured by an electron spectrometer aboard ISEE-1 is described. Examples of the contour plots and an explanation of how to use the program, including the necessary computer code for running the program on the GSFC 360/91 computer is presented. The method by which the discrete measurements of the distribution function, given by points on the four dimensional surface are synthesized into a smooth surface in a three dimensional space which can be contoured is described. The velocity components are parallel and perpendicular to the magnetic field, respectively, in the proper frame of the electrons. S.L.

TRANSONIC AIRFOIL DESIGN OF FULL POTENTIAL FLOW. 2: DEVELOPMENT OF THE FORTRAN CODE
Tomiko Ishiguro, Nobuhiko Kamiya, Nobuhiro Kawai, and Keiko Oguchi 1981 97 p refs In JAPANESE; ENGLISH summary
(NAL-TR-673; ISSN-0389-4010) Avail: NTIS HC A05/MF A01

A user's manual for the FORTRAN program is presented which is coded following the numerical procedure developed for design of transonic airfoils. This program can solve the inverse problem irrespective of the presence of shock waves. The airfoil geometry is designed so that the width of the trailing edge is the required one. The boundary layer calculation is included in a procedure whereby an actual airfoil geometry is obtained by subtracting a displacement thickness of a boundary layer from an airfoil geometry. R.J.F.

USE OF AN ENGINEERING DATA MANAGEMENT SYSTEM IN THE ANALYSIS OF SPACE SHUTTLE ORBITER TILES
Gary L. Giles and Maria Vallas Oct. 1981 13 p refs Presented at the AIAA Computers in Aerospace 3rd Conf., San Diego, Calif., 26-28 Oct. 1981
(NASA-TM-83215) Avail: NTIS HC A02/MF A01 CSCL 09B

The use of an engineering data management system to facilitate the extensive stress analyses of the space shuttle orbiter thermal protection system is demonstrated. The methods used to gather, organize, and store the data; to query data interactively; to generate graphic displays of the data; and to access, transform, and prepare the data for input to a stress analysis program are described. Information related to many separate tiles can be accessed individually from the data base which has a natural organization from an engineering viewpoint. The flexible user features of the system facilitate changes in data content and organization which occur during the development and refinement of the tile analysis procedure. Additionally, the query language supports retrieval of data to satisfy a variety of user-specified conditions. S.L.

RECOGNIZE REGULAR LANGUAGES WITH PROGRAMMABLE BUILDING BLOCKS Interim Report
M. J. Foster and H. T. Kung 19 Jun. 1981 13 p refs
(Contracts N00014-80-C-0236; F33615-78-C-1551)
(AD-A104874; CMU-CS-81-126) Avail: NTIS HC A02/MF A01 CSCL 09/2

This paper introduces a new programmable building-block for recognition of regular languages. By combining three types of basic cells a circuit for recognizing any regular language can be constructed or 'programmed' automatically from the regular expression describing that language. Recognizers built in this way are efficient pipeline circuits that have constant response time and avoid broadcast. In addition, the paper proposes the use of a single, regular layout, called the PRA (programmable recognizer array), that can be 'personalized' to recognize the language specified by any regular expression. PRA's provide compact reconfigurable layouts for recognizer circuits, requiring only O(n log n) area for regular expressions of length n. Author (GRA)

USING PROGRAM TRANSFORMATIONS TO DERIVE LINE-DRAWING ALGORITHMS
Robert F. Sproull Apr. 1981 19 p refs
(Contract F33615-78-C-1551; ARPA Order 3597)
(AD-A104873; CMU-CS-81-117) Avail: NTIS HC A02/MF A01 CSCL 09/2

A wide variety of line-drawing algorithms can be derived by applying program transformations to a simple, obviously correct algorithm. The transformations increase the algorithm's performance and eliminate the need for floating-point computations. Two familiar algorithms are derived in this way: Bresenham's algorithm and the digital differential analyzer (DDA). The transformations are then used to derive several highly parallel variants of Bresenham's algorithm, designed for use on displays that can generate more than one pixel at a time. The treatment shows a complete, extended example of the practical use of program transformations. Moreover, the transformations derive Bresenham's algorithm without recourse to complex geometric arguments. Author (GRA)

MINIMIZING COMPUTATIONAL COST FOR DYNAMIC PROGRAMMING ALGORITHMS
A. Waibel, N. Krishnan, and R. Reddy 17 Jun. 1981 25 p refs
(Contract F33615-78-C-1551; Grant NSF MCS-78-25824; ARPA Order 3597)
(AD-A104792; CMU-CS-81-124) Avail: NTIS HC A02/MF A01 CSCL 09/2

In this study we introduce and test several methods to reduce the computational cost in dynamic programming algorithms for isolated word recognition systems. Three methods will be discussed in detail: (1) pruning by preset thresholds; (2) search based on the Branch and Bound technique; (3) branch and Bound based search with additional pruning. Compared to conventional algorithms, Method 3 could be seen to yield a speed up of approximately a factor of 5, at no loss of recognition accuracy. The branch and bound method with pruning is also ideally suited for research oriented systems, since pruning is independent of the parametrization used (eliminates the necessity for retuning thresholds). Additional features of this method, which are of importance to maintaining the flexibility and diagnosticity needed for such a system, will be discussed. Author (GRA)

SCHEMES FOR COMMUNICATION
Mathai Joseph 3 Jun. 1981 44 p refs
(Contract F33615-78-C-1551; ARPA Order 3597)
(AD-A104791; CMU-CS-81-122) Avail: NTIS HC A03/MF A01 CSCL 09/2

This report describes features of a language for distributed and parallel programming which has been designed to provide flexibility in the transfer of information and control between the individual components of a program. The language allows synchronous and asynchronous message-passing, multiple-source input and broadcast output, and enables particular features of a distributed architecture to be efficiently accommodated without modification to the language. The module serves as the unit of encapsulation and a single communication takes place between an output port in one module and a set of input ports in other modules: each port has a control rule which specifies the protocol for sending or receiving messages, and is associated with a particular communication scheme which implements the communication operations. Modules are assumed to execute independently of each other except when they communicate by sending messages: the lifetime of a module is therefore limited only by its ability to send and receive messages. The use of the distinctive features of the language, such as broadcast mode output, is illustrated with several examples. Author (GRA)

PARALLEL STRING PARSING USING LATTICE GRAPHS
Azriel Rosenfeld May 1981 18 p refs
(Grant AF-AFOSR-3271-77; AF Proj. 2304)
(AD-A105028; TR-1036; AFOSR-81-0623TR) Avail: NTIS HC A02/MF A01 CSCL 09/2

Given a grammar G and a string sigma, all possible parses of sigma can be constructed by repeatedly applying the rules of G in parallel. This process creates a 'lattice graph' in which any directed path from the least element to the greatest element is a sentential form that occurs in a (partial) parse of sigma. Examples are given illustrating how, at least for some grammars, this process does not lead to a combinatorial explosion, and could thus be used to parse strings very rapidly if suitable parallel hardware were available. AN OPERATIONAL APPROACH TO REQUIREMENTS SPECIFICATION FOR EMBEDDED SYSTEMS
Pamela Zave Aug. 1981 71 p refs
(Contract F49620-80-C-0001; AF Proj. 2304)
(AD-A105459; AFOSR-81-0662TR) Avail: NTIS HC A04/MF A01 CSCL 09/2

The approach to requirements specification for embedded, systems described in this paper called 'operational' because a requirements specification is an executable model of the proposed system interacting with its environment. The approach is embodied by the language PAISLey, which is motivated and defined herein. Embedded systems are characterized by asynchronous parallelism, even at the requirements level; PAISLey specifications are constructed of interacting processes so that this can be represented directly. Embedded systems are also characterized by urgent performance requirements, and PAISLey offers a formal, but intuitive, treatment of performance. Author (GRA)

ERROR PROPAGATION AND ELIMINATION IN COMPUTER PROGRAMS

Larry J. Morell and Richard G. Hamlet Jul. 1981 50 p refs
(Contract F49620-80-C-0001; AF Proj. 2304)
(AD-A105437; TR-1065; AFOSR-81-0661TR) Avail: NTIS HC A03/MF A01 CSCL 09/2

The current literature in program testing is surveyed. A strategy is proposed for eliminating categories of errors from programs. Errors may be classified as functional (an incorrect input-output pair) or structural (an incorrect statement). An error is eliminated if a successful program execution for a given input implies the program could not contain the error. A 'creation condition' guarantees that a structural error affects the program's computation. A 'propagation condition' guarantees that the effect produces a functional error. An error is eliminated whenever a computation satisfies both the creation and the propagation condition and produces correct output. Author (GRA)

(AD-A104964; AI-M-625) Avail: NTIS HC A02/MF A01 CSCL 06/4

The next generation of artificial intelligence programs will require the ability to organize knowledge as groups of active objects. Each object should have only its own local expertise, the ability to operate in parallel with other objects, and the ability to communicate with other objects. Artificial Intelligence programs will also require a great deal of flexibility, including the ability to support multiple representations of objects, and to incrementally and transparently replace objects with new, upward-compatible versions. To realize this, we proposed a model of computation based on the notion of an actor, an active object that communicates by message passing. Actors blur the conventional distinction between data and procedures. The actor philosophy is illustrated by description of our prototype actor interpreter Act 1. Author (GRA)

SOFTWARE MODELING STUDIES. VOLUME 2: THE POLYNOMIAL MEASURE OF COMPLEXITY Final Technical Report, Jan. 1978 - Oct. 1980

Henry Ruston Jul. 1981 60 p refs
(Contract F30602-78-C-0057; AF Proj. 2304)
(AD-A105004; RADC-TR-81-183-Vol-2) Avail: NTIS HC A04/MF A01 CSCL 09/2

A new measure of software complexity is introduced, one which describes a flow chart by a polynomial. This measure takes both the elements of a flow chart and its structure into account. Rules are given for obtaining the polynomials for various types of flow charts. The polynomial complexity measure can be used to compare alternate software designs and to divide a computer program into modules to obtain a minimal overall complexity. A comparison is made of this measure with several known complexity measures. Author (GRA)

TECHNOLOGY OF TOMORROW: COMPUTER ASSISTED DESIGN AND FABRICATION Final Report [VEILLE TECHNIQUE CFAO]

M. Chaussier 28 Nov. 1980 45 p refs In FRENCH
(CETIM-1.4A.32.3) Avail: NTIS HC A03/MF A01

The potentials of computer assisted design and fabrication (CADF) are analyzed for mechanical applications in industry. Adaptation of CADF systems to the specific needs of industrial companies is seen as problematical. The linking of many systems through ever more sophisticated data bases is suggested in order to improve CADF efficiency. The impact of interactive man machine techniques and of automated decision making are taken into account. Interactive graphics, a successful application of CADF, is cited for its contribution to mechanical engineering. Increased development and diffusion of CADF technology is forecast. Author (ESA)

(TNOT/0001/SAAB-Issue-3; TNOT/0007/SAAB-Issue-1; RA-SAT-5-275-Issue-2; ESA-CR(P)-1445) Avail: NTIS HC A04/MF A01

The results of the acceptance test of the breadboard model of a multispectral image data processor (IDP) are presented. A timing analysis of critical parts is included. Data were successfully compressed into 16 and then 32 classes. The hardware design of a processor for data rate reduction of image data for remote sensing satellites is given. The data reduction unit processes a whole multispectral image line. It is composed of several elementary processors (compressor modules) working in parallel. Each compressor module is a multispectral IDP, processing a 512 (maximum) pixel multispectral line segment. A breadboard model was used to verify functioning of the design of the processor with respect to those parts of the circuits carrying out specific steps of the selected algorithm. Author (ESA)

ALGOL 68 PLUS: A SUPERLANGUAGE OF ALGOL 68 FOR PROCESSING THE STANDARD-PRELUDE
L. G. L. T. Meertens and J. C. vanVliet Jun. 1981 18 p refs
(MC-IW-168/81) Avail: NTIS HC A02/MF A01; Stichting Mathematisch Centrum, Amsterdam FL 3.15

A sequence of declarations in a super language of ALGOL 68, ALGOL 68 plus, is given. These declarations together constitute the standard-prelude. In order to have an ALGOL 68 compiler process a version of the standard-prelude, it is necessary to define ALGOL 68 plus in which that version is written. The compiler must be able to accept programs (modules) written in ALGOL 68 plus. The necessary super language is defined, but only insofar as changes are needed to accomodate the standard-prelude itself (including the transput). Author (ESA)

CORRECTNESS OF PROGRAMS WITH FUNCTION PROCEDURES
J. W. deBakker, J. W. Klop, and J.-J.C. Meyer (Free Univ., Amsterdam) Jul. 1981 21 p refs Submitted for publication
(MC-IW-170/81) Avail: NTIS HC A02/MF A01; Stichting Mathematisch Centrum FL 3.15

The correctness of programs with programmer-declared functions is investigated. The framework of typed lambda calculus with explicit declaration of (possibly recursive) functions is used. Its expressions occur in the statements of a simple language with assignment, composition and conditionals. A denotational and an operational semantics for this language are provided, and their equivalence is proven. A proof system for partial correctness is presented and its soundness is shown. Completeness is then established for the case that only call by value is allowed. Allowing call by name as well, completeness is shown only for the case that the type structure is restricted, and at the cost of extending the language of the proof system. The completeness problem for the general case remains open. In the technical considerations, an important role is played by a reduction system which essentially makes it possible to reduce expression evaluation to systematic execution of auxiliary assignments. Termination of this reduction system is shown using Tait's computability technique. Author (ESA)

THE ANALYSIS AND SYNTHESIS OF INTERCONNECTION NETWORKS FOR DISTRIBUTED COMPUTER SYSTEMS Ph.D. Thesis
Han-Ping Daniel Chen 1981 270 p
Avail: Univ. Microfilms Order No. 8120931

An interconnection network is synthesized from a set of user-specified requirements. Four well-defined synthesis procedures are proposed: the element deletion synthesis procedure, the matrix-reductio synthesis procedure, the stagewise-formulation synthesis procedure, and the tree-merging synthesis procedure. The user requirements are divided into two major categories: functional constraints and design constraints. A generalized failure model the 2 x 2 basic switching element is presented. A generalized reliability model is defined to handle all known failure modes and any given component dependency. A graphical evaluation structure and some graphical AND-OR operations are introduced to evaluate configuration reliability, connection reliability, functional reliability, and network reliability. Two kinds of network descriptions are used: first the physical structure containing elements and wiring patterns; second, the logical model containing a set of logical entities using the graphical model as a starting point. MULTICAST AND SYNCHRONIZATION IN DISTRIBUTED SYSTEMS
Jan Skansholm 1981 51 p refs
(Contract SWEDBTD-71.348-U-253)
(CTH-81.2-R) Avail: NTIS HC A04/MF A01

The construction of distributed algorithms and synchronization tools in distributed systems becomes simple if a multicast addressing principle is used. However, the transport mechanism must satisfy the requirements that all messages are delivered to all processes, and that all messages are delivered in the same order to all processes. These requirements are found to be realistic and some network types are especially well suited for this kind of addressing. An algorithm is presented which can make any network able to guarantee that messages are delivered in the same order to the processes in a system. Author (ESA)

FAULT TESTING AND DIAGNOSIS IMPLEMENTATION IN MICROPROCESSOR CONTROLLED DATA NETWORKS
Wafae Boghdady Mar. 1981 227 p refs
(ESNT-D-81001) Avail: NTIS HC A11/MF A01

Fault testing technique is reviewed and on-line self test procedures for microprocessor systems are proposed. Random access memory (RAM) test procedures with half the test time requirement of the known RAM minimum test pattern, MASEST, and increased applicability are considered. Global self test procedures for microprocessor units, derived from a combination of structural, functional and behavioral approaches, specified by introducing algorithmic patterns, and composed of sequential dedicated programs, each of which has its own meaningful test objective are discussed. Oriented test procedures based on the combination of the philosophy of real time tests and the partitioning of the applications programs by controllability observability and maintenance engineering technique (COMET) are presented. THE QUEUEING DELAY PROBLEM IN MULTIPLE ACCESS SCHEMES Ph.D. Thesis

Terek Nazir Saadawi 1980 164 p

Avail: Univ. Microfilms Order No. 8121100

Multiple access schemes with a finite number of buffered uses were analyzed. The approach is suitable for a variety of accessing schemes including random access schemes and reservation based demand access. The approach models the interaction between the competing terminals by a combination of two Markov chains; describes the buffer concepts of the typical user, and describes the state of all the users in the system. The dependence between equilibrium distributions of the states of the user Markov chain and those of the system Markov chain produces sets of coupled equations for these probabilities which are solved numerically. It is assumed that all messages consist of single packets, which are generated in a bursty manner, the arrival process at each terminal is assumed to be Bernoulli.

A SURVEY OF SOME PROBLEMS AND RECENT RESULTS FOR PARAMETER ESTIMATION AND OPTIMAL CONTROL IN DELAY AND DISTRIBUTED PARAMETER SYSTEMS

H. T. Banks Jul. 1981 33 p refs Presented at the Conf. on Volterra and Functional Differential Equations, Blacksburg, Va., 10-13 Jun. 1981

(Contracts NAS1-15810; NAS1-16394; DAAG29-79-C-0161; Grants AF-AFOSR-3092-76; NSF MCS-79-05774-02; AF Proj. 2304)

(NASA-CR-16491; AD-A105415; LCDS-81-19; AFOSR-81-0670TR) Avail: NTIS HC A03/MF A01 CSCL 12A

The investigator surveyed a number of applications and problems motivating his current efforts on numerical techniques for parameter estimation in and optimal control of delay and partial differential equations. He then outlined two different approaches for establishing theoretical convergence results for estimation algorithms. An application of modal techniques to the investigation of transport in brain tissue is briefly explained. A sketch of a convergence theory for spline techniques for function space parameter estimation problems is given. GRA

A number of Artificial Intelligence (AI) systems have appeared in recent years whose approaches appear very fruitful for a wide variety of real-world tasks that are performed by knowledgeable (but not necessarily understanding) experts. In the interest of acquainting a wider audience to a representative sampling of these systems, and especially to the approaches they embody, the following selective reading list is proposed. These readings are not overly technical, and usually make their main points by way of examples of natural language dialog between a user and the expert AI system. Papers usually contain further references to related work and background material. The intended audience includes engineers (especially designers), social scientists, computer specialists without AI background, and other professionals. In the following, I have grouped papers roughly into categories, some of which contain specific systems while others are broader overviews or even general introductions to the wider field of AI. In the interest of being representative, a number of systems of approximately equal significance to those given hear have been omitted. The papers here do in fact refer to these others. GRA

SEMANTICS OF INHERITANCE AND ATTRIBUTIONS IN THE DESCRIPTION SYSTEM OMEGA

Giuseppe Attardi and Maria Simi Aug. 1981 43 p refs

(Contracts N00014-80-C-0505; N00014-75-C-0522)

(AD-A104776; AI-M-642) Avail: NTIS HC A04/MF A01 CSCL 05/7

Omega is a description system for knowledge embedding which incorporates some of the attractive modes of expression in natural language such as descriptions, inheritance, quantification, negation, attributions and multiple viewpoints. Omega represent an investigation both on logic formalisms more expressive then first order predicate logic and on the foundations of knowledge representation. The logic of Omega combines mechanisms of the predicate calculus, type systems, and set theory. As-a logic, Omega achieves the goal of an intuitively sound and consistent theory of classes which permits unrestricted abstraction within a powerful logic system. Description abstraction is the contruct provided in Omega corresponding to set abstration. Attributions and inheritance are the basic mechanisms for knowledge structuring. To achieve flexibility and incrementality, the language allows to express descriptions with an arbitrary number of attributions, rather then predicates with a fixed number of arguments as in predicate logic. This requires an unusual interpretation for instance descriptions, which in turn provides insights into the use and meaning of several kind of attributions. The logic foundations for Omega are investigated. Semantic models are provided, an axiomatization is derived and the consistency and completeness of the logic is established.

PROJECT IMPACT ANALYSIS AS AN OPTIMAL CONTROL PROBLEM

G. Anandalingam 1981 43 p refs Presented at the Joint Meeting of the Inst. of Management Sci. and Operations Res. Soc., Toronto, 3-6 May 1981

(Contract DE-AC02-76CH-00016)

(DE81-028465; BNL-29881; CONF-810542-5) Avail: NTIS HC A03/MF A01

The effects of a major investment project on a multi-sector less developed economy are analyzed. Single investment projects with external effects reaching across the entire economy are frequently encountered in developing countries. The Mahaweli Ganga development project in Sri Lanka, a multi-dam irrigation and hydroelectric power project is evaluated. The Mahaweli project calls for an annual investment level, in 1970 prices, of $150 million over a period of six years, which is 50 percent of the annual expenditure of the government. The project requires a large fraction of total investment over a medium term planning period and materially alters the existing supply and demand for major goods and services. The project is sufficiently large that its effect is economy-wide. The model used is a dynamic input-output optimizing model having the mathematical structure of an optimal control problem. DOE

THE NUMERICAL SOLUTION OF FREDHOLM INTEGRAL EQUATIONS OF THE FIRST KIND Ph.D. Thesis

Kevin Ray Hickey 1981 135 p

Avail: Univ. Microfilms Order No. 8122522

A convergence theorem for Lee and Prenter's filtered least squares method for solving the Fredholm first kind equation $Kf = g$ is corrected. Under suitable restrictions, the filtered least squares method is shown to be well-posed under compact perturbations in K and arbitrary perturbations in g. Several convergence results are proved for the M-solution. A modified Gram-Schmidt method for calculating the M-solution of Kf = g is compared to a modification of the normal equations method which is used to calculate the M-solution of Kf = g. This modified Gram-Schmidt method is shown to be well-posed under compact perturbations in K and arbitrary perturbations in g. A convergence theorem for Marti's method for solving the Fredholm first kind equation Kf = g is corrected. Marti's method is shown to be well-posed under perturbations in g. It is shown that Marti's method is not necessarily well-posed under compact perturbations in K. Dissert. Abstr.

NATURAL EXPONENTIAL FAMILIES WITH QUADRATIC VARIANCE FUNCTIONS

Carl N. Morris Jul. 1981 41 p Prepared jointly with Rand Corp., Santa Monica, Calif.
(Grant NSF MCS-80-03416)
(P-6637) Avail: NTIS HC A03/MF A01

The normal, Poisson, gamma, binomial, and negative binonial distributions are characterized as natural exponential families with quadratic variance functions. A sixth family is identified as being generated by the hyperbolic secant distribution. These families are examined in a unified way with respect to infinite divisibility, cumulants, orthogonal polynomials, large deviations, and limits in distribution. Insights are obtained concerning the possible limit laws and the self-regulating nature of infinite divisibility. R.J.F.

A REGRESSION DESIGN APPROACH TO OPTIMAL AND ROBUST SPACING SELECTION

Randall L. Eubank Jul. 1981 20 p refs
(Contract N00014-75-C-0439)
(AD-A104728; TR-144) Avail: NTIS HC A02/MF A01 CSCL 12/1

The problem of location and/or scale parameter estimation using the asymptotically best linear unbiased estimator based on sample quantiles is considered. The problem of optimal spacing selection for these estimators is shown to be equivalent to the problem of regression design for time series with Brownian motion or Brownian bridge covariance structures and a particular variable knot spline approximation problem. This equivalence is employed, in conjunction with a regression framework, to investigate the asymptotic properties of certain spacing selection schemes. In particular, an asymptotic alternative is developed to a robust estimation procedure suggested by Chan and Rhodin (1980). Author (GRA)

MINIMUM MEAN SQUARE ERROR PREDICTION OF AUTOREGRESSIVE MOVING AVERAGE TIME SERIES

H. Joseph Newton and Marcello Pagano (State Univ. of New York at Buffalo) Apr. 1981 29 p refs
(Contracts DAAG29-80-C-0070; N00014-81-MP-10001)
(AD-A104939; TR-N-24) Avail: NTIS HC A03/MF A01 CSCL 12/1

A computer program is described and presented for calculating finite memory predictors and prediction variances for autoregressive moving average time series models. The Cholesky decomposition algorithm is used, and a number of simplifying results are described and implemented in the program. Author (GRA)

N82-12849# Texas A&M Univ., College Station. Inst. of Statistics.

AUTOREGRESSIVE SPECTRAL ESTIMATION, LOG SPECTRAL SMOOTHING AND ENTROPY

Emanuel Parzen Jul. 1981 9 p refs
(Contract DAAG29-80-C-0070)
(AD-A104940; TR-N-26) Avail: NTIS HC A02/MF A01 CSCL 12/1

Two important methods of spectral estimation, autoregressive spectral estimation, and log spectral kernel estimation are derived from a minimum information divergence estimation principle. The fact that autoregressive spectral estimators are maximum entropy estimators is shown to be proved without the use of the calculus of variations using the properties of minimum information divergence estimation. Adaptive procedures for forming these estimators (and combining to form iterated estimators) are provided by order-determining and truncation point determining criteria, which are described. An estimated spectrum is given for Wolfer's sunspot data. Author (GRA)

A MODEL FOR UNCOORDINATED DISTRIBUTED COMPUTATION OF FIXED POINTS

Dimitri P. Bertsekas Sep. 1981 7 p refs
(Contract N00014-75-C-1183)
(AD-A104819; LIDS-P-1144) Avail: NTIS HC A02/MF A01 CSCL 09/2

We present an algorithmc model for distributed computation of fixed points whereby several processors participate simultaneously in the calculations while exchanging information via communication links. We place essentially no assumption on the ordering of computation and communication between processors thereby allowing for completely uncoordinated execution. We find that even under these potentially chaotic circumstances it is possible to solve several important classes of problems including the calculation of fixed points of contraction and monotone mappings arising in linear and nonlinear systems of equations, shortest path problems, and dynamic programming. SOLUTION METHODS ON ALGEBRA PROBLEMS WITH SIMULTANEOUS EQUATIONS

Jane Sachar Jan. 1981 24 p refs
(AD-A105178; RAND/P-6593) Avail: NTIS HC A02/MF A01 CSCL 12/1

Problem solving approaches often find a path from the givens to the unknown or from the unknown to the givens. This study explores those approaches using written protocols of Navy subjects while solving for the numerical value of an unknown from several knowns and a system of equations. For a subset of the items, solutions require subjects to retain expressions with both literals and numerals. Successful and unsuccessful students were similar in their preference to work backward and to use literals rather than numerals and in the efficacy of their solutions. Students acquired successful solution methods during instruction and used them consistently. Author (GRA)

THE AUTOMATIC SOLUTION OF FREDHOLM EQUATIONS OF THE SECOND KIND

H. Schippers Dec. 1980 31 p refs Submitted for publication
(MC-NW-99/80) Avail: NTIS HC A03/MF A01; Stichting Mathemathisch Centrum, Amsterdam FL 4.20

A code for the automatic solution of Fredholm equations of the second kind, solve-int-eq, is presented. The linear system resulting from the discretization of the integral equation is iteratively solved by a multiple grid method. This method was selected because it has been shown that multiple grid processes take only 0 (N sup 2) arithmetic operations. For a variety of problems, the performance of solve-int-eq is compared with Aktinson's program iesimp. This program appears to be about 50% more expensive than solve-int-eq. Additionally, solve-int-eq was applied to the aerodynamic problem of calculation of potential flow around a Karman-Trefftz airfoil. Numerical examples were computed on a CDC Cyber 175 computer in single precision arithmetic. Results demonstrate the appropriateness of solve-int-eq to this class of aerodynamic problem. INSTRUCTIVE EXPERIMENTS WITH RUNGE-KUTTA-ROSENBRUCK METHODS

J. G. Verwer Mar. 1981 25 p refs Submitted for publication
(MC-NW-100/81) Avail: NTIS HC A02/MF A01; Stichting Mathematisch Centrum, Amsterdam FL 3.15

Certain boundedness properties of Runge-Kutta-Rosenbrock methods when applied to nonlinear stiff systems are dealt with. Instructive examples and numerical experiments are performed with a number of simple two stage schemes and the Rosenbrock code ROW4A. Attention is paid to the conversion of nonautonomous problems to the autonomous form. An important conclusion is that this conversion may lead to a significant loss in accuracy. Author (ESA)

N82-12857# Stichting Mathematisch Centrum, Amsterdam (Netherlands). Dept. of Numerical Mathematics.

ON THE PRACTICAL VALUE OF THE NOTION OF BN-STABILITY

J. G. Verwer Mar. 1981 12 p refs Submitted for publication
(MC-NW-101/81) Avail: NTIS HC A02/MF A01; Stichting Mathematisch Centrum, Amsterdam FL 3.15

A standard implementation of diagonally implicit Runge-Kutta methods, having equal diagonal elements, is discussed. Under what circumstances unconditional nonlinear stability can be realized in practice is questioned. The oldest concept of unconditional stability of numerical integration methods for ordinary differential systems is that of A-stability. This concept is related to linear systems having constant coefficients. There has been much interest in unconditional stability properties of numerical integration methods when applied to nonlinear dissipative systems (G-stability, BN-stability, A-contractivity). Various classes of implicit Runge-Kutta methods have already been shown to be BN-stable. However, contrary to the property of A-stability, when implementing such a method for practical use this unconditional stability property may be lost. This is clarified for the class of diagonally implicit methods and it is shown at the same time that Rosenbrock's method is not BN-stable. Author (ESA)

N82-12858# Stichting Mathematisch Centrum, Amsterdam (Netherlands). Dept. of Numerical Mathematics.

APPLICATION OF THE OSHER-ENGQUIST DIFFERENCE SCHEME AND THE FULL MULTIGRID METHOD TO A TWO DIMENSIONAL NONLINEAR ELLIPTIC MODEL EQUATION

E. J. vanAsselt Apr. 1981 19 p refs Submitted for publication
(MC-NW-103/81) Avail: NTIS HC A02/MF A01; Stichting Mathematisch Centrum, Amsterdam FL 3.15

A nonlinear boundary value problem in two dimensions is considered. For the discretization of this boundary value problem, the Osher-Engquist difference scheme is used and the discrete equations are solved by a full multigrid method (FMGM). In the FMGM, a coarse to fine sequence of grids with uniform meshes is applied. The result obtained on a coarser grid serves as initial approximation to the solution on the finer grid. On each grid the discrete equations are solved by Newton iteration. The Newton equations are approximately solved by the iterative use of a linear multilevel algorithm. Numerical results are given and comparisons with the method of time steps show that the multigrid approach is far more efficient than the method with explicit time steps. Author (ESA)

ANALYSIS OF RICHARDSON ITERATION IN MULTIGRID METHODS FOR NONLINEAR PARABOLIC DIFFERENTIAL EQUATIONS

P. J. vanderHouwen and B. P. Sommeijer Apr. 1981 41 p refs Submitted for publication
(MC-NW-105/81) Avail: NTIS HC A03/MF A01; Stichting Mathematisch Centrum, Amsterdam FL 5.25

The behavior of nonlinear Richardson iteration in multigrid methods for solving the implicit relations obtained when an implicit one step method is applied to the space discretized form of a nonlinear parabolic differential equation is analyzed. This analysis leads to an unconventional form of the Richardson method which turns out to be a remarkably efficient predictor formula to start the multigrid method. Numerical experiments are run with a two grid algorithm and a comparison is made with nonlinear Gauss-Seidel iteration. For large integration steps and for strongly nonlinear problems the Richardson iteration method appears to be superior to Gauss-Seidel iteration. Author (ESA)

N82-12860# Stichting Mathematisch Centrum, Amsterdam (Netherlands). Dept. of Numerical Mathematics.

A SPECIAL CLASS OF MULTISTEP RUNGE-KUTTA METHODS WITH EXTENDED REAL STABILITY INTERVAL

P. J. vanderHouwen and B. P. Sommeijer May 1981 33 p refs Submitted for publication

(MC-NW-106/81) Avail: NTIS HC A03/MF A01; Stichting Mathematisch Centrum, Amsterdam FL 4.20

A special class of k-step Runge-Kutta methods is investigated which is generated by nonlinear Chebyshev iteration (Richardson iteration) of an implicit linear multistep method. By terminating the iteration process after m iterations, a family of the k-step, m-stage Runge-Kutta method is obtained whose real stability interval can be derived for general values of k and m by a special application of the boundary locus method. The real stability boundary is maximized by choosing suitable values for the coefficients in the generating k-step method. The considerations are mainly restricted to second order methods. Examples are given for k = 1,2,3, and 4, and numerical experiments are reported with a nonlinear parabolic initial boundary value problem. Author (ESA)

MODIFIED MULTILAG METHODS FOR VOLTERRA FUNCTIONAL EQUATIONS

P. H. M. Workenfelt Jun. 1981 33 p refs Submitted for publication

(MC-NW-108/01) Avail: NTIS HC A03/MF A01; Stichting Mathematisch Centrum, Amsterdam FL 4.20

Linear multistep methods for ordinary differential equations in conjunction with a family of computationally efficient quadrature rules are employed to define a class of multilag methods for the solution of Volterra integral and integrodifferential equations. In addition, modified multilag methods are proposed which have the property that the stability behavior is independent of the choice of the quadrature rules. High-order convergence of the methods is established. In particular, a special class of high-order convergent methods is presented for the efficient solution of first kind Volterra equations. Numerical experiments are reported. Author (ESA)

N82-12862# Stichting Mathematisch Centrum, Amsterdam (Netherlands). Dept. of Computer Science.

TWO THEOREMS ABOUT THE COMPLETENESS OF HOARE'S LOGIC

J. A. Bergstra (Leiden Univ.) and J. V. Tucker (Bristol Univ. England) Apr. 1981 16 p refs Submitted for publication

(MC-IW-165/81) Avail: NTIS HC A02/MF A01; Stichting Mathematisch Centrum, Amsterdam FL 3.15

Two theorems about the completeness of Hoare's logic for the partial correctness of 'while' programs over an axiomatic specification are proven. The first result is a completion theorem: any specification (Sigma, E) can be refined to a specification (Sigma sub zero, E sub zero), conservative over (Sigma, E), whose Hoare's logic is complete. The second result is a normal form theorem: any complete specification (Sigma, E) possessing some complete logic for partial correctness can be refined to an effective specification (Sigma sub zero, E sub zero), conservative over (Sigma, E), which generates all true partial correctness formulas with Hoare's standard rules. SIMULATION OF THE THERMAL BEHAVIOR OF AN OBJECT AND ITS NEARBY SURROUNDINGS

P. A. M. Jacobs Feb. 1980 96 p refs

(Contract A72/KL/026)

(PHL-1980-08; IDCK-73838) Avail: NTIS HC A05/MF A01

A physical-mathematical model which describes thermal behavior of an object in a natural environment is presented. An airtight rectangular box was fixed to a base which prevents evaporation, (brick, concrete, etc). Dimensions are arbitrary. The model is used to decide specifications for camouflage materials and/or to predict thermal contrasts. It calculates the daily course of temperature, sunshine etc. and the total irradiance incident on a detector at a given bearing. For given meteorological data the model solves the time dependant heat balance equation valid for the box surface and base. Effects of shadow, wind sheltering, etc., are taken into account. An explicit finite difference method is used for the algorithm. When checked against measurement (wind, solar irradiance, etc.) the model performs well. Author (ESA)

A STATISTICAL APPROACH TO FUZZY DATA ANALYSIS Ph.D. Thesis

Larry Wayne Lewis 1981 169 p

Avail: Univ. Microfilms Order No. 8121457

An extension of classical nonparametric hypothesis testing is given for the analysis of fuzzy-number data. An atypical format which permits a theoretical population containing fuzzified forms of data which reside in a classical population is discussed. A fuzzified parametric hypothesis testing format is given. This format lends itself to the direct analysis of fuzzy data sets of known distributional form. Both the nonparametric and the parametric procedures outlined for fuzzy data analyses reduce to their classical antecedents when the fuzzy numbers are sharp--i.e., real numbers. Dissert. Abstr.

LOG ODDS RATIO ESTIMATION IN A GROUPED POPULATION Ph.D. Thesis

Richard Sposto 1981 237 p

Avail: Univ. Microfilms Order No. 8122850

A population consisting of a subpopulation of diseased individuals and one of nondiseased individuals, and made up of K-groups, such that the withingroup log odds ratio phi, of exposure to a factor is the same in all groups is considered. Methods to obtain point estimates and confidence intervals for phi in K-groups are examined. Some of the asymptotic properties of the point and interval estimators are derived and a sampling experiment is performed to assess and compare the small sample properties of these estimators. The study of properties of confidence intervals for the common log odds ratio is emphasized. It is indicated that the sampling experiment of the Mantel-Haenszel or unconditional maximum likelihood estimators of phi are at least as good as or preferable to the others. Dissert. Abstr.

N82-12866 California Univ., Los Angeles.

SPACE-TIME CLUSTERING ANALYSIS Ph.D. Thesis

Timothy Lane McAuliffe 1981 149 p

Avail: Univ. Microfilms Order No. 8120999

Methods for detecting space time clustering was surveyed. A method of testing for space time clustering which does not depend on arbitrary constants is proposed. Procedure is based on nearest neighbor distances. It is suggested that the powers of the Knox and the Mantel reciprocal transformation method are quite sensitive to the choice of their critical constants, with the Knox methods the more sensitive. The nearest neighbor approach has power usually as great as that of the Mantel procedure. The nearest neighbor approach is recommended for testing the presence of space time clustering based on its control of the true significance level, its power and its avoidance of choosing arbitrary constants. Dissert. Abstr.

DISCRIMINATION RULES BASED ON MARGINAL DISTRIBUTIONS Ph.D. Thesis

Carl Edward Pierchala 1981 285 p

Avail: Univ. Microfilms Order No. 8121031

A new method of discriminant analysis used in a recent medical study was evaluated. The D-Rule method is based on the marginal distributions of the observations. For bivariate

Gaussian populations, results for the D-Rule were obtained and interpreted in geometric terms. The performance of Fisher's linear discrimination rule (LDR) in the case of the known univariate lognormal populations was examined. The effects of sample size and of missing values were studied. Sampling distributions of the cross-validation total probability of correct classification were compared by of box-and-whisker plots. The methods studied were the D-Rule; three variants thought to be improvements upon the D-Rule; and two versions of the LDR for missing data. The consequence of using the resubstitution total probability of correct classification to choose among the several rules is also studied.

OPTIMAL ADAPTIVE STOCHASTIC CONTROL OF LINEAR DYNAMICAL SYSTEMS WITH MULTIPLICATIVE AND ADDITIVE NOISE Ph.D. Thesis
Hagop Vartevar Panossian 1981 181 p
Avail: Univ. Microfilm Order No. 8121027

The adaptive stochastic control of linear multivariable discrete time systems with purely random parameters is investigated. No aposteriori learning is available for the system parameters and the control law is non-dual. In these cases of perfect measurement, the apriori level of uncertainty of the system parameters modulates the control law and the certainty equivalence principle does not apply. It is shown that for the linear-quadractic Gaussian (LQG) optimal control problem the steady-state solution exists only under certain conditions. The stability and optimality are treated and contrasted by studying the discounted cost version of the LQG problem. For the situation of noisy measurement, the problem of estimating the plant phase coordinate vector is considered. An algorithm is developed which is of lower dimension than the Kalman-Bucy filtering algorithm. The control law requires the solution of a coupled, highly nonlinear two point boundary value problem. Computer simulations of the forward and backward difference equations involved are presented for some insight for the closed-loop system.

ERROR PROPAGATION IN THE GRAVITY MODEL Ph.D. Thesis
James Stuart Weber 1981 216 p
Avail: Univ. Microfilms Order No. 8120574

The need for modeling of flows, the frequent use of the gravity family of models, the necessity for a basic statistical perspective, and the calculus notation needed for the study of error propagation in a multidimensional setting are reviewed. Two procedures for computing the linear estimates of the error propagation for the doubly constrained gravity model are derived, and the appropriate procedure for the estimation of confidence intervals for minority employment given certain aggregate statistics, the estimation of confidence intervals for doubly constrained gravity model forecasts, and the more efficient updating of doubly constrained gravity model flows are applied. The error propagation statistics for the generalized gravity model separation factor parameters is studied. Error propagation is examined in the context of model output in terms of estimates of expected flows, of forecasts of flows, and of an efficient updating procedure as well as in the context of variable selection and fitting the model to observed data.
Dissert. Abstr.

A QUANTILE FUNCTION APPROACH TO THE k-SAMPLE QUANTILE REGRESSION PROBLEM Ph.D. Thesis
James Michael White 1981 122 p
Avail: Univ. Microfilms Order No. 8121975

A procedure for estimating the parameters of a quantile regression function is investigated. The procedure is based on the work of Parzen (1979a) in the theory of quantile functions and is applicable to a wide range of distributional families. The procedure assumes the quantile functions of k populations to be location-scale shifts of a common quantile function. First, a goodness-of-fit procedure for determining the common distributional shape of the k populations generalizes the one-population data modeling techniques of Parzen. An estimator of the shape parameter of a distribution is also investigated. A regression model for the location and scale parameters is specified, and the resulting estimators of the regression parameters are used to determine a regression function for any quantiles of the observed data. Finally it is shown that inferences about the quantile relationships can be based on the asymptotic normality of the estimated parameters. The procedures are applied to some published data sets.

ON PROBABILITY PROPORTIONAL TO SIZE SAMPLING DESIGNS: THEIR CONSTRUCTION, ALGEBRAIC PROPERTIES, AND APPLICATIONS Ph.D. Thesis
Bing-Ying Lang Lin 1981 78 p
Avail: Univ. Microfilms Order No. 8120568

A special method of sample selection, the so-called probability proportional to size sampling designs (abbreviated to PPS sampling designs) is presented. A sample, flexible, complete class type procedure is devised to construct PPS sampling designs (without replacement) for any sample size. The procedure for constructing a PPS sampling design is described. An algebraic interpretation of PPS sampling designs is described. Utilizing this algebraic interpretation, PPS sampling designs with property (2) are found by solving some related linear programming problems.

THE DISTRIBUTION OF QUADRATIC FORMS IN NORMAL VARIABLES WITH APPLICATIONS TO THE COMPARISON OF VARIABLE SELECTION CRITERIA Ph.D. Thesis
Robert Hayes Brown 1981 115 p
Avail: Univ. Microfilms Order No. 8121606

Some existing representations for the distribution function of quadratic forms in normal variables are reviewed and are found to lead to inefficient computational algorithms. In the positive definite case it is shown that these inefficiencies can be overcome through a simple rearrangement in the order of computations. These representations are then extended to the case of indefinite quadratic forms and it is shown that the computational efficiencies carry over to the more general case. Some well-known results concerning the mean squared error function of preliminary test estimates are reviewed and are seen to be restricted to the case where the test statistic is a simple function of the residual sum of squares of the given models. These results are then extended to the more general case where the test statistic is only assumed to be a quadratic form in the observations. The resultant mean squared error function is seen to involve the distribution function of a quadratic form in normal variables. Two variable selection criteria are then compared.

CONFIDENCE INTERVAL ESTIMATION AND TESTS FOR TEMPORARY OUTMIGRATION IN TAG-RECAPTURE STUDIES Ph.D. Thesis
John Paul Balser 1981 215 p
Avail: Univ. Microfilms Order No. 8119520

A probability model was devised using the conditional distribution of the subsequent recaptures of the marked animals released at the various sample times, given appropriate summary statistics. The test is based on the chi square distribution and the power of the test is approximated for a number of possible parameter configurations by Monte Carlo simulation. The conditional test is derived and its power examined for the multiple recapture experiment as analyzed by the Jolly-Seber method, and for the bird banding study, a type of single recapture census. The power of this test is approximated by Monte Carlo simulation and is compared to that of the conditional test. For the Jolly-Seber method, the maximum likelihood estimate and two unbiased type estimates are examined. It is concluded that the confidence interval based on the natural logarithmic transformation is best for the Jolly-Seber estimate of survival, and that based on the square root transformation is best or the bird banding survival estimate.

DEVELOPMENT AND ANALYSIS OF A MODIFIED SCREENING PROCEDURE TO INCREASE ACCEPTABLE PRODUCT
Youn-Min Chou (Texas Univ. at San Antonio) and D. B. Owen

Aug. 1981 16 p refs
(Contract N00014-76-C-0613)
(AD-A104936; TR-148) Avail: NTIS HC A02/MF A01 CSCL 12/1

Much work has been done on screening procedures under the assumption of a bivariate normal distribution. However, very little effort has been expended on data which are from a truncated bivariate normal distribution. Methods are developed for a screening procedure to increase acceptable product from a truncated distribution. An acceptance criterion on a linear combination of the largest order statistics from a truncated normal population with a given truncation point is discussed. This paper also uses the approximate distribution of the sample correlation coefficient in random samples of any size drawn from a singly truncated bivariate normal distribution to obtain a lower confidence limit on the population correlation coefficient sigma. The screening procedure discussed here is based on knowledge of the truncation point, the sample size and the lower confidence limit for sigma. Author (GRA)

ON THE COMPUTATION OF OPTIMAL DESIGNS FOR CERTAIN TIME SERIES MODELS WITH APPLICATIONS TO OPTIMAL QUANTILE SELECTION FOR LOCATION OR SCALE PARAMETER ESTIMATION

Randall L. Eubank, Patricia L. Smith, and Philip W. Smith Jul. 1981 28 p refs Prepared in cooperation with Old Dominion Univ., Norfolk, Va.
(Contract N00014-75-C-0439; Grant DAHC04-75-0816)
(AD-A104935; TR-146) Avail: NTIS HC A03/MF A01 CSCL 12/1

Using the results of Chow (1978) on the optimal placement of knots in the approximation of functions by piecewise polynomials, an algorithm is presented for the computation of optimal designs for certain time series models considered by Eubank, Smith and Smith (1981). The ideas underlying this algorithm form a unified approach to the computation of optimal spacings for the sample quantiles used in the asymptotically best linear unbiased estimator of a location or scale parameter. THE FINITE MEMORY PREDICTION OF COVARIANCE STATONARY TIME SERIES

H. J. Newton and Marcello Pagano (State Univ. of New York at Buffalo) Apr. 1981 17 p refs
(Contracts DAAG29-80-C-0070; N00014-81-MP-10001; N00014-78-C-0599; Grant NCI CA-28066)
(AD-A105413; TR-N-21) Avail: NTIS HC A02/MF A01 CSCL 12/1

An algorithm is presented for conveniently calculating h step ahead minimum mean square linear predictors and prediction variances given a finite number of observations from a covariance stationary time series Y. It is shown that elements of the modified Cholesky decomposition of the covariance matrix of observations play the role in finite memory prediction that the coefficients in the infinite order moving average representation of Y play in infinite memory prediction. The algorithm is applied to autoregressive-moving average time series where further simplifications are shown to occur. A numerical example illustrating the basic points of the general algorithm is presented. Author (GRA)

ON SOME NUMERICAL PROPERTIES OF ARMA PARAMETER ESTIMATION PROCEDURES

H. Joseph Newton Jul. 1981 8 p refs
(Contract DAAG29-80-C-0070)
(AD-A104938; TR-N-25) Avail: NTIS HC A02/MF A01 CSCL 12/1

This paper reviews the algorithms used by statisticians for obtaining efficient estimators of the parameters of a univariate autoregressive moving average (ARMA) time series. The connection of the estimation problem with the problem of prediction is investigated with particular emphasis on the Kalman filter and modified Cholesky decomposition algorithms. A result from prediction theory is given which provides a significant reduction in the computations needed in Ansley's (1979) estimation procedure. Finally it is pointed out that there are many useful facts in the literature of control theory that need to be investigated by statisticians interested in estimation and prediction problems in linear time series models. NORM CONDITIONS FOR THE PATH REGULARITY OF RANDOM PROCESSES

Olav Kallenberg 1981 16 p refs
(CTH-Math-1981-12) Avail: NTIS HC A02/MF A01

Norm continuous L sub p processes of bounded L sub p-variation (p > 1) are shown to be absolutely continuous with respect to some fixed measure. Moreover, the rate of convergence of the norm sums for finite interval partitions provides precise information on the sample path behavior of the process and its density, such as Lipschitz conditions on the process or its density, and absolute continuity of the density. A basic role is played by a general norm inequality for L sub p random variables of independent interest. Author (ESA)

LARGE-SCALE SYSTEMS OPTIMIZATION USING NONLINEAR INTEGER GOAL PROGRAMMING METHODS Ph.D. Thesis
Charles Hulbert Alvord, III 1981 199 p
Avail: Univ. Microfilms Order No. 8120397

Hybrid algorithms for solving large scale optimization problems which contain nonlinear constraints and/or objectives and discrete decision variables are presented. Goal programming fundamentals are used and several heuristics are combined with the modified Hooke-Jeeves pattern search technique. Nonlinear programming methods, discrete optimization methods, and heuristics are reviewed. Each method is evaluated for suitability in the content of a nonlinear integer goal programming algorithm. Arguments on the computational complexity of heuristic methods are summarized. The algorithm is applied to two real world large scale multi-objectie optimization problems, the system partitioning problem and the distributed processing design problem. The algorithm's performance is shown empirically for these problem types. Dissert. Abstr.

SATISFACTORY SOLUTIONS APPROACH TO CONTROL AND OPTIMIZATION OF LARGE-SCALE SYSTEMS Ph.D. Thesis
Nachappagounder Gopalsami 1981 152 p
Avail: Univ. Microfilms Order No. 8120565

The design of decentralized control structures with minimum communication links among the controllers is considered. The decomposition of a large system problem into subproblems corresponding to subsystems and the coordination of the solution of these subproblems to obtain the overall solution is described. A multilevel feedback scheme is considered, in which the subsystems are decoupled by ignoring the interactions and the local controllers are designed in an optimal control theoretic setup. These subsystems are then interconnected and coordinated using the interaction variables in a feedback form. The degree of suboptimality of the derived control law can be inferred from a theoretical result, which provides a lower as well as an upper bound on the optimal index. An alternate approach to coordination is devised to make use of the cooperative aspect of the subsystems. The necessary mathematical framework to define and quantify a satisfactory solution is developed by considering a parameter optimization problem with a vector type of performance index. Numerical examples are presented to illustrate the solutions approach. A decentralized type of control for an interconnected power system is devised. Dissert. Abstr.

(Contract N00014-79-C-0685)
(AD-A105117) Avail: NTIS HC A03/MF A01 CSCL 12/1

The work at the center on game-theoretic models of multiperson decision problems has strengthened the analytical tools available to study the phenomena of organizations. There are bright prospects that several of the more intractible topics can be addressed a new with better chances of clear-cut resolution. To take a specific example, we are particularly interested in developing the theory of bargaining modeled as a dynamic game with incomplete information. That is, bargaining or negotiations are typically affected by incomplete information about each other's preferences, resources, and opportunities. At the same time, bargaining is inherently a dynamic process of offers and counteroffers, perhaps interrupted by combative tactics (strikes, lockout, 'war'). It seems clear that the analysis of such a model can proceed smoothly along the lines developed in work to date. GRA

Optically induced changes in magnetization (optomagnetism) have been observed for CdCr2Se4 and several other magnetic semiconductors. The effect has never been adequately explained although the most likely cause is RKKY coupling through optically excited carriers. Optomagnetism and other manifestations of carrier-spin interaction are intimately related to the electronic structure of these materials, particularly the narrow d and f bands. Realistic theories of these effects are lacking, in part because of the controversy surrounding the electronic structure of many of these materials. GRA

INVESTIGATIONS OF THE REFLECTION, TRANSMISSION, AND CONVERSION OF ULTRASONIC WAVES Ph.D. Thesis
Hugh Miles South 1981 134 p
Avail: Univ. Microfilms Order No. 8120048

A theory describing the reflection, transmission, and mode conversion of surface waves at the corners of wedges is developed. The theory is an asymptotic one, and the mathematics is developed for two regions of wedge: near the apex and far from the apex. The reflection and transmission coefficients of the surface waves are calculated and are shown to compare favorably with experimental results. The partition of power between the various wave types is also calculated. This partition provides a good check on the internal consistency of the theory. Next a optical technique for the measurement of bulk waves is described, and measurements using this technique are presented. The relationship between bulk waves and the optical properties of the sample material is then examined in detail. Experimental results are presented to confirm the theoretical predictions. Dissert. Abstr.

(Contract NAS7-100)
(NASA-Case-NPO-15453-1; US-Patent-Appl-SN-314929) Avail: NTIS HC A02/MF A01 CSCL 20A

An object within a chamber is acoustically moved by applying wavelengths of different modes to the chamber to move the object between pressure wells formed by the modes. In one system, the object is placed in one end of the chamber while a resonant mode, applied along the length of the chamber, produces a pressure well at the location. The frequency is then switched to a second mode that produces a pressure well at the center of the chamber, to draw the object. When the object reaches the second pressure well and is still traveling towards the second end of the chamber, the acoustic frequency is again shifted to a third mode (which may equal the first mode) that has a pressure well in the second end portion of the chamber, to draw the object. A heat source may be located near the second end of the chamber to heat the sample, and after the sample is heated it can be cooled by moving it in a corresponding manner back to the first end of the chamber. The transducers for levitating and moving the object may be all located at the cool first end of the chamber. NASA

VERIFICATION OF AN ACOUSTIC TRANSMISSION MATRIX ANALYSIS OF SOUND PROPAGATION IN A VARIABLE AREA DUCT WITHOUT FLOW

J. H. Miles 1981 15 p refs Presented at the 102 Meeting of the Acoustical Soc. of Am., Miami Beach, Fla., 1-4 Dec. 1981
(NASA-TM-82741; E-1053) Avail: NTIS HC A02/MF A01 CSCL 20A

A predicted standing wave pressure and phase angle profile for a hard wall rectangular duct with a region of converging-diverging area variation is compared to published experimental measurements in a study of sound propagation without flow. The factor of 1/2 area variation used is sufficient magnitude to produce large reflections. The prediction is based on a transmission matrix approach developed for the analysis of sound propagation in a variable area duct with and without flow. The agreement between the measured and predicted results is shown to be excellent. Author

REGIONAL DEPENDENCE OF VERY LOW-FREQUENCY SOUND ATTENUATION IN THE DEEP SOUND CHANNEL: CORRELATION WITH INTERNAL WAVE MEASUREMENTS

David G. Browning, Michael J. Fecher, and Robert H. Mellen 22 Sep. 1981 16 p Conf. held at Honolulu, Hawaii, 27 Nov. - 1 Dec. 1978
(AD-A105061; NUSC-TD-6561) Avail: NTIS HC A02/MF A01 CSCL 20/1

The most promising mechanism for the very low-frequency sound attenuation observed in the deep sound channel is diffusive scattering by internal waves. Mellen, et al. (1976) have obtained estimates for the extra attenuation using the Garrett-Munk internal wave model and found consistency with the lower experimental values reported. Kibblewhite, et al. (1978) have shown a definite regional dependence in the Pacific. This paper compares regional oceanographic measurements with the Garrett-Munk internal wave model and also correlate local acoustic measurements with estimates of the extra attenuation. GRA

MEASUREMENT OF SOUND ABSORPTION OF SCREENS

Hans Jonasson Dec. 1979 53 p refs
(SP-RAPP-1979-31) Avail: NTIS HC A04/MF A01

A method for measurement in a reverberation room is given. Screens are randomly arranged in discrete positions with a minimum distance of 2 m between them. No screen is closer than 1 m to any reflecting surface. The measurements are carried out in 1/3 octave bands in the frequency range 100 to 5000 Hz. Below 300 Hz separate measurements with at least two sound sources, 3m apart, are made. Recordings are made with at least five microphone positions. Minimum number of decays for each frequency band is 10. A significant difference is shown between in-line and discrete positioning of screens. Discrete positions are recommended. Author (ESA)

EFFECT OF THE ORIENTATION OF THE SPEAKER'S HEAD AND AZIMUTH OF A NOISE SOURCE ON THE SPEECH RECEPTION THRESHOLD FOR SENTENCES

R. Plomb and A. M. Mimpen 1980 12 p refs Submitted for publication

(IZF-1980-18; TDCK-75015) Avail: NTIS HC A02/MF A01

The speech reception threshold (SRT) for sentences in a free field condition was investigated as a funcion of (1) the orientation of the speaker's head, and (2) the azimuth of a noise source, with the listener always looking in the direction of the speaker. A miniature electric microphone with a flat frequency response was glued to the upper lip of a pseudospeaker standing 2 m from a loudspeaker. For each of ten directional orientations of the pseudospeaker, corresponding to angles, of zero deg. 22.5 deg. 45 deg. 90 deg. and 180 deg relative to the loudspeaker, a list of 13 sentences was reproduced and rerecorded through the microphone. Results show that (1) the maximum effect of direction in speech radiation from the mouth of the speaker ie, in terms of signal to noise ratio, 6 dB, and (2) the maximum effect of the azimuth of the noise source is 10 dB. NONLINEAR INTERACTION OF SOUND WAVES IN WATER: EXPERIMENTS WITH PARAMETRIC ARRAYS

J. Verbiest, P. L. Rosenkranz, and J. M. H. Theunissen Oct. 1979 61 p refs

(PHL-1979-44; TDCK-73423) Avail: NTIS HC A04/MF A01

The theory of nonlinear interaction of sound waves and approaches to numerical prediction of parametric sound generation in water are presented. Lighthill's wave equation, nonlinearity in fluids, second order wave equations, collinear plane waves, attenuation effects, and calculation of the second order sound field are discussed. Sound pressure is measured as a function of range and azimuth angle with a hydrophone. A discrepancy between measured and predicted curves based on difference frequencies is shown. Author (ESA)

Progress is reported on research in molecular physics involving electron-bombardment molecular dissociation. The velocity distribution of metastable and ionic fragments are measured using a pulsed electron beam and a time-of-flight technique. Fragments from the hydrogen molecule and its deuterated forms have been investigated using electron energies from 30 to 100 electron-volts. Dissociation channels via particular molecular or molecular ion excited states have been proposed to explain observed features in the velocity spectra. A similar experiment involving hydrogen fragments from the hydrogen halides is also in progress. Preliminary data show several resolved velocity groups indicating the presence of multiple dissociating channels. Experiments using water and hydrogen sulfide molecules are also underway. Finally, we are continuing to develop our ion mass filter which allows us to obtain separate ion velocity distributions for each mass in a situation in which several ion masses are present. OXYGEN INDUCED TRIPLET STATE TRANSITIONS OF BENZENE IN CRYOGENIC SOLUTIONS

J. Lee and E. R. Bernstein 16 Sep. 1981 21 p refs Submitted for publication Sponsored in part by ONR and NSF

(Contract N00014-79-C-0647)

(AD-A105432; TR-4) Avail: NTIS HC A02/MF A01 CSCL 07/3

A new way of investigating the oxygen induced triplet state transitions of simple organic molecules is presented. The method involves dissolving the organic along with oxygen in hydrocarbon liquids such as propane, ethane, or propene. Both triplet B(lu) from singlet A(lg) and triplet E(lu) from singlet A(lg) transitions of C6H6 and C6D6 are studied in this work. These results indicate that both triplet states and their vibrational spacings are quite sensitive to the environment. The suggested dominant feature of the triplet B(lu) state of C6H6 is nu(8) (916 per cm) of e(2g) symmetry. Observed triplet state intensity enhancement is believed to be due to a non-statistical oxygen/benzene van der Waals complex formed in the low temperature liquid. Author (GRA)

DYNAMICS OF AN INTENSE RELATIVISTIC ELECTRON BEAM INJECTED INTO FULL DENSITY AIR

R. B. Fiorito, E. W. Fordham, J. R. Greig, R. E. Pechacek, J. D. Sethian, R. F. Fernsler, and J. C. Halle 21 Sep. 1981 43 p refs

(RR0110941)

(AD-A104743; NRL-MR-4557) Avail: NTIS HC A03/MF A01 CSCL 20/8

We have injected an intense relativistic electron beam (about 1 Mev, 16 kA, 25 ns) into the atmosphere and observed the beam in visible light caused by direct beam excitation of air molecules. The emitted visible light was primarily emission in the 2nd positive system of N2 which was delayed with respect to the beam current by about 6 ns but had the same duration (FWHM) as the beam current. Streak photographs of the beam in this visible light were taken with an Imacon 790 camera at various axial positions with a camera time resolution of about 1 ns. These photographs show that the beam remained a single current filament which oscillated about its initial direction as it propagated through the atmosphere, and that while the 'body' of the beam was pinched to a radius of < or = 5 cm the 'nose' was expanded to give the characteristic trumpet-like shape. Beam and net current monitors were used to determine the beam current and the plasma return current whose peak value was > or = 60% of the peak beam current. Comparison of the measured net current to that predicted from the calculated air conductivity and a simple circuit model to represent the beam propagating in the atmosphere showed good agreement provided a transmission line model including the capacitance of the beam in the ionized atmosphere was used. BREMSSTRAHLUNG ENERGY SPECTRA FROM ELECTRONS OF KINETIC ENERGY 1 keV LESS THAN OR EQUAL TO T LESS THAN OR EQUAL TO 2000 keV INCIDENT ON NEUTRAL ATOMS 1 LESS THAN OR EQUAL TO Z LESS THAN OR EQUAL TO 92

Lynn Kissel, Crawford MacCallum, and R. H. Pratt (Pittsburgh Univ.) Aug. 1981 73 p refs

(Contract DE-AC04-76DP-00789)

(DE81-030984; SAND-81-1337) Avail: NTIS HC A04/MF A01

Theoretical predictions for the electron bremsstrahlung energy spectrum from neutral atoms as a function of atomic number Z, incident electron kinetic energy T, and fraction of energy radiated k/T (k is the emitted photon energy) were tabulated. Values for

2 less than or equal to Z less than or equal to 92 were obtained by interpolation from a smaller set of calculated data points. The calculated points were obtained by describing bremsstrahlung as a single-electron transition in a relativistic self-consistent screened potential. Tabulated values for Z = 1 are obtained from the formfactor corrected Born approximation times the Elwert Factor. The tables correct errors found in a previous tabulation. Various plots of the tabulation are presented and the general behavior of the energy sspectrum is discussed. Energy scaling of the spectrum is investigated and T/Z is found to best scale the data. PAPIN: A FORTRAN-4 PROGRAM TO CALCULATE CROSS SECTION PROBABILITY TABLES, BONDARENKO AND TRANSMISSION SELF-SHIELDING FACTORS FOR FERTILE ISOTOPES IN THE UNRESOLVED RESONANCE REGION

J. G. Munoz-Cobos Aug. 1981 41 p refs
(Contract W-7405-eng-26)
(DE81-030436; ORNL/TM-7883; ENDF-310) Avail: NTIS HC A03/MF A01

A FORTRAN 4 code was developed to calculate cross section probability tables, Bondarenko self-shielding factors, and average self-indication ratios for non-fissile isotopes, below the inelastic threshold, on the basis of prescriptions for the unresolved resonance region. Monte-Carlo methods are utilized to generate ladders of resonance parameters in he unresolved resonance region, from average resonance parameters and their appropriate distribution functions. The neutron cross sections are calculated by the single level Breit-Wigner formalism, with s, p and d-wave contributions. The cross section probability tables are constructed by sampling the Doppler-broadened cross sections. The various self-shielded factors are computed numerically as Lebesgue integrals over the cross section probability tables. The program was validated through extensive comparisons with several deterministic codes. DOE

DESCRIPTION AND USE OF THE MONTE CARLO CODE LILITA

J. GomezdelCampo and Robert G. Stokstad Sep. 1981 42 p refs
(Contract W-7405-eng-26)
(DE81-030704; ORNL/TM-7295) Avail: NTIS HC A03/MF A01

Two major applications of the code LILITA were developed. The first is the prediction of relative yields, computer energy spectra and angular distributions of evaporation residues and light particles (alphas, protons and neutrons) produced in a heavy-ion compound-nuclear reaction. The second consists of modeling the equilibrium decay of excited fragments produced in a two-body collision (such as quasi-elastic or deep inelastic scattering). The equilibrium decay of the reaction products is calculated by using the Hauser-Feshbach formula in conjunction with the Monte Carlo method. The approximations used in evaluating the Hauser-Feshbach formula and its use in conjunction with the Monte Carlo method are described. A description of the program input and a discussion of the event-by-event calculations are given. The processing of the event-by-event file used for coincidence calculations, either for fusion reactions or for two-body inelastic collisons is described. Comments on the parameters used for the statistical model calculations are given, and the flow diagram of the code is discussed. DOE

NUCLEAR STRUCTURE STUDIES BY THE SCATTERING OF MEDIUM-ENERGY ELECTRONS Progress Report, 1 Oct. 1980 - 31 Jul. 1981

G. A. Peterson Aug. 1981 33 p refs
(Contract DE-AC02-76ER-02853)
(DE81-030058; DOE/ER-02853/T1) Avail: NTIS HC A03/MF A01

Both magnetic elastic and transverse inelastic scattering cross sections were measured. A liquid-nitrogen-cooled gas target is used in a study of deuteron elastic magnetic scattering and electrodisintegration over a large energy range. A measurement of elastic magnetic and transverse inelastic scattering from N-14 was started. Measurements of the elastic magnetic scattering from C-13, N-15, Al-27, Si-29, and P-31 were completed. The data set on N-15 inelastic scattering are now complete and analysis of the data is in progress. A study of M8 transitions in Fe-54 and Ni-60 is nearing completion. A measurement of the transverse quasi-elastic scattering from Fe-56 was started. Large-basis shell model calculations pertaining to the above nuclei and others were made. Theoretical calculations of exchange currents, nuclear convection currents, and other nuclear phenomena are in progress. Finally, considerations are being given to the design of an integrated storage-ring-experimental system. DOE

INCLUSIVE PROTON SPECTRA AND TOTAL REACTION CROSS SECTIONS FOR PROTON-NUCLEUS SCATTERING AT 800 MeV

John Alexander McGill Aug. 1981 103 p refs
(Contract W-7405-eng-36)
(DE81-030505; LA-8937-T) Avail: NTIS HC A06/MF A01

Current applications of multiple scattering theory to describe the elastic scattering of medium energy protons from nuclei are shown to be quite successful in reproducing the experimental cross sections. These calculations use the impulse approximation, wherein the scattering from individual nucleons in the nucleus is described by the scattering amplitude for a free nucleon. Such an approximation restricts the inelastic chennels to those initiated by nucleon-nucleon scattering. As a first step in determining the nature of p + nucleus scattering at 800 MeV, both total reaction cross sections and (p,p') inclusive cross sections were measured and compared to the free p + p cross sections for hydrogen, deuterium, and compared to the free p + p cross sections for hydrogen, deuterium, calcium 40, carbon 12, and lead 206. It is concluded that as much as 85% of all reactions in a nucleus proceed from interactions with a single nucleon in the nucleus, and that the impulse approximation is a good starting point for a microscopic description of p + nucleus interactions at 800 MeV. DIFFUSION OF GASES IN CAPILLARIES Ph.D. Thesis

Nathan S. Jacobson Aug. 1981 108 p refs
(Contract W-7405-eng-48)
(DE82-000267; LBL-13227) Avail: NTIS HC A06/MF A01

Two aspects of the diffusion of gases in capillaries are explored. A Monte Carlo computer simulation of Knudsen flow is adapted to count collisions and record collision distributions. The behavior of gases in both open and closed end tubes is examined. Given a tube with one end closed and a length-to-radius ratio of L/R, it is shown that a molecule entering this tube will strike the wall an average of 2 L/R times before escaping and that most molecules do not travel vary far into the pore. Those reaching the pore bottom usually strike the walls many times before escaping. The average number of collisions a molecule undergoes in passng through an open-end capillary is also calculated. If the reaction probability is already known, the

processes in a supported catalyst can be simulated. From this analysis the distribution of active material, pore size, and pellet diameter can be optimized for a given reaction. Knudsen and surface diffusion in porous alumina is studied. Measurements of surface diffusion are shown to be temperature dependent.

MONTE CARLO SIMULATION OF MOLECULAR FLOW IN A NEUTRAL-BEAM INJECTOR AND COMPARISON WITH EXPERIMENT

R. A. Lillie, T. A. Gabriel, S. W. Schwenterly, R. G. Alsmiller, Jr., and R. T. Santoro Sep. 1981 30 p refs Submitted for publication
(Contract W-7405-eng-26)
(DE82-000503; ORNL/TM-7911) Avail: NTIS HC A03/MF A01

Monte Carlo calculations were performed to obtain estimates of the background gas pressure and molecular number density as a function of position in the prototype neutral beam injector. Estimates of these quantities together with the transient and steady state energy deposition and molecular capture rates on the cryopanels of the cryocondensation pumps and the molecular escape rate from the injector were obtained utilizing a detailed geometric model of the neutral beam injector. The molecular flow calculations were performed using an existing Monte Carlo radiation transport code which was modified slightly to monitor the energy of the background gas molecules. The credibility of these calculations was demonstrated by the excellent agreement between the calculated and experimentally measured background gas pressure in front of the beamline calorimeter located in the downstream drift region of the injector. The usefulness of the calculational method as a design tool was illustrated by a comparison of the integrated beamline molecular density over the drift region of the injector for three modes of cryopump operation.

(DE81-030426; ORNL/TM-7879) Avail: NTIS HC A05/MF A01

Four 50-kV, 100-A sources to be used for neutral beam heating of the confined plasma on Tokamak device were constructed. These sources have higher current capability than scaled down sources, and they are required to run for 0.5 s as opposed to the 0.3 s requirement for other sources. Due to an innovative electrode design, these higher power sources met these requirements and achieved a higher transmission efficiency - 76% of the total input power on target. Using the same electrode design with a tetrode accelerating structure and an indirectly heated cathode, repeatable long pulse, high energy conditions of, 70 kV, 7 A, 8 s, and 90 kV, 9 A, 5 s were achieved. Grid deformation calculations and Monte Carlo beam blocking, direct recovery device is described, and theoretical considerations of it are discussed.

(MPIS-14/1980; ISSN-0436-1199) Avail: NTIS HC A05/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 17,40

An experimental scattering device was developed and used to determine closed channel (Feshbach) resonances in systems belonging to the outer range which require a high energy resolution and apparatus time constant. A primary blast nozzle source with a broad velocity range and a high time constant was developed and tested on the known H2-Kr system whose integral scattering cross section was determined with a 2.2% resolution. Theoretical background and detailed apparatus description are presented. To determine Feshbach resonances the integral scattering cross sections of the p-H2-Kr and HD-Xe systems were measured with an energy resolution from 1.9 to 2.2% in the range of the j=0 to 2 rotation transition, which is not sufficient to prove these resonances. Several improvements of the apparatus are required.

APPLICATION AND DESCRIPTION OF THE INTERACTING BOSON MODEL Ph.D. Thesis

Philip Dewitt Duval 1981 140 p
Avail: Univ. Microfilms Order No. 8120729

The principles and phenomenology of the interacting boson model (IBM) are reviewed. The basic model is applied to the even tungsten isotopes and compared with experimental observables associated with the low-lying states. These observable include transition rates, branching ratios, rho(EO) values, quadrupole moments of the first two excited 2(+) states, two-neutron separation energies, and isomer and isotope shifts. The results agree with the experimental data. The IBM is extended to describe configuration mixing two sub-shells. The predictions for the IBM parameters dependent on neutron number are seen to be in better agreement with empirically determined values than the predictions for the single j-shell (the proton-number dependent parameters are not treated) The interacting boson-fermion model for describing nuclei with an odd number of protons or neutrons is introduced Dissert Abstr

The energy extraction efficiency as a function of input intensity was determined from a large-volume HF amplifier For an input intensity of 4 x 10(6)W/cm(2), 1080 Joules was extracted from the amplifier This corrresponded to an energy extraction efficiency of 0.90 At the highest H2/F2/O2 pressures used, 1700 Joules was obtained from this system when used in an oscillator configuration These results also show evidence that energy extraction at low input intensities in large-volume HF amplifiers is strongly influenced by parasitic oscillations The results also indicate that, for a long-pulse HF amplifier (60-nsec electron beam), the timing between th amplifier and oscillator to achieve optimum operating conditions is not very critical This same amplifier, used in conjunction with a short-pulse, good-beam-quality oscillator-preamplifier chain, has also been used to evaluate pulse compression using angular multiplexing Using two sequential 24-nsec pulses, the essential elements of angulr multiplexing were evaluated as a function of interpulse separation time DOE

Practical matrix materials for future develoment that most enhance the stability of the matrix waste forms were investigated. The functions of the matrix were reviewed Desirable matrix material properties were discussed and listed relative to the matrix functions. Potential matrix materials were discussed and recommendations were made for future matrix development. The matrix mechanically contains waste cores, reduces waste form temperatures, and is capable of providing a high quality barrier to leach waters High r matrices that separate and individually encapsulate the waste cores are fabricated by powder fabrication methods, such as sintering, hot pressing, and hot isostatic pressing. Three material classes potential satisfy the requirements for a barrier matrix and are recommended for development: titanium, glass, and graphite. Polymers appear to be marginally adequate, and a more thorough engineering assessment of their potential should be made. DOE

LOW-LEVEL RADIOACTIVE WASTE: AN INTRODUCTORY OVERVIEW
H. W. Godbee and A. H. Kibbey 1981 9 p Presented at the ASME Short Course on Radioactive Waste Management for Nucl. Power Reactors and Other Facilities, Alexandria, Va., 13-17 July, 1981
(Contract W-7405-eng-26)
(DE81-026334; CONF-810733-1) Avail: NTIS HC A02/MF A01

In 1980, the accumulated volume of buried low-level waste (LLW) in the United States amounted to over 92,000 cu m. Of this, 49,700 cu m was attributed to the US commercial fuel cycle, 36,400 cu m to institutional and industrial, and 76,300 cu m to government activities. In addition, there was another 6500 cu m of LLW sent to commercial burial grounds from government agencies or other licensed activities (e.g., fabrication of fuel for foreign reactors). If no more land is licensed for commercial burial, Barnwell with its limited waste acceptance will be the only site still operating in the year 2000. Of the DOE sites, only NTS and Hanford will have ample land. All the other principal DOE sites except LASL will be exhausted and this site will have about 7 of usable land left. DOE

PROCESS FOR THE DENITRIFICATION OF HIGH-LEVEL RADIOACTIVE LIQUID WASTES
F. J. Gattys 10 Jul. 1981 17 p refs Transl. into ENGLISH of German patent 2,807,324 (21 Feb. 1978)
(DE81-026875; PNL-TR-415) Avail: NTIS HC A02/MF A01

Commercial paraformaldehyde with a low water content and mean particle size smaller than 60 microns is introduced as denitrifying agent at about 110 C into the liquid waste. A buffer of citric acid and phosphate is added during the denitrification reaction. The escaping gases contain nitrogen oxides which are recombined and concentrated to about 40 percent by weight nitric acid. DOE

MONITOR FOR DETECTING NUCLEAR WASTE LEAKAGE IN A SUBSURFACE REPOSITORY
S. Klainer, T. Hirschfeld, H. Bowman, F. Milanovich, D. Perry, and D. Johnson 5 Nov. 1980 89 p refs
(Contract W-7405-eng-48)
(DE81-026429; LBL-11981) Avail: NTIS HC A05/MF A01

A remote fiber optics system is employed in conjunction with the coprecipitation enhanced fluorimetry technique to detect radioactive waste leakage. An in situ monitoring capability using fiber optics to effect communication between the instrumentation and the sample is demonstrated. The sample is an actinide or a tracer material leaking from an underground nuclear waste repository into the ground water. A lanthanide (which is an excellent fluorescent agent), actinide or other species which does not radiation damage is chosen as the tracer to maximize sensitivity, specificity, and relevance. Taggants having variable excitatio and emission wavelengths create a need for an acromatic retroreflective fiber coupler. This was done using the geometrical properties of the fiber to design a coupler requiring no dichroics or glossy energy splitting surfaces. DOE

CALCULATION OF TRANSIENT AND QUASI-STATIONARY FLOWS IN HIGH TEMPERATURE REACTORS WITH SPHERICAL NUCLEAR FUEL ELEMENTS, USING THE VORTEX FLOW METHOD Ph.D. Thesis [ZUR ANWENDUNG DER WIRBELSTROMMETHODE FUER DIE TRANSIENTE UND QUASISTATIONAERE STROEMUNGSBERECHNUNG IN HOCHTEMPERATURREAKTOREN MIT KUGELFOERMIGEN BRENNELEMENTEN]
Immanuel Hoefer Dec. 1980 183 p refs In GERMAN
(IKE-4-98) Avail: NTIS HC A09/MF A01

The equations of the vortex flow method were derived in their primitive form for inhomogeneous regions in order to calculate the flows and the temperature behavior in high temperature nuclear reactors, aiming at a further development of the computerized simulation of these reactors. By modifying the flow function in parallel channels in the reflector region, a parallel flow is simulated. The flow in regions with low pressure losses are approximated by a potential flow. After comparing a number of explicit and implicit difference methods to solve numerically the time dependent convective part of the equations, the method UPWIND differences was chosen as an interpolation procedure. Examples show the applicability of this calculation method for spherical nuclear fuel elements with forced and natural convection. Author (ESA)

OPTOGALVANIC SPECTROSCOPY AND CATAPHORETIC LASER ISOTOPE SEPARATION Ph.D. Thesis
Andrew Keith Gabriel 1981 313 p
Avail: Univ. Microfilms Order No. 8121059

A microscopic theory for the positive column discharge (PCD) was developed using rate equations and power balance equations to model the microscopic discharge processes. Macroscopic variables were calculated from the microscopic parameters. The model is used to characterize a hydrogen-helium PCD. The equations in the model are modified to account for the presence of resonant (H-alpha) radiation from an external source. The model is then used to predict the voltage change in a hydrogen PCD (the optogalvanic effect) as a function of current, illumination intensity, and gas pressure. The results compare very favorably with experiments conducted to measure the OGE. Dissert. Abstr.

STUDY OF HOLLOW CORNER RETROREFLECTORS FOR USE IN A SYNCHRONOUS ORBIT Final Report, Sep. 1974 - Feb. 1975

P. R. Yoder, Jr. Mar. 1975 119 p refs
(Contract NAS5-20580)
(NASA-CR-166750; ER-275) Avail: NTIS HC A06/MF A01 CSCL 20F

The performance of a hollow corner cube retroreflector made up of three mutually perpendicular optically flat mirrors when undergoing the thermal-mechanical strains induced by a spacecraft environment was studied. Of particular interest was a device of 200 square centimeter optical aperture used on a satellite in a synchronous orbit. It was assumed that the reflector always faces the earth. The effects of direct solar irradiance, earthshine, and albedo were considered. The results included the maximum mirror surface temperature during the orbit as well as the worst-case loss of optical performance due to thermally-induced mirror distortions. It was concluded that a device made of three suitably coated flat ULE mirrors, optically contacted to each other and supported mechanically in a nonrigid mount, would be expected to concentrate over 80 percent of the theoretical maximum energy in the central of the far field diffraction pattern. Continued development of the device through a detailed design, fabrication, and test phase was recommended. R.J.F.

INTEGRATION OF A DETECTOR ARRAY WITH AN OPTICAL WAVEGUIDE STRUCTURE AND APPLICATIONS TO SIGNAL PROCESSING Final Report, 15 Jun. 1976 - 14 Mar. 1981

J. T. Boyd, D. A. Ramey, C. L. Chen, A. Naumaan, and S. Dutta 7 Aug. 1981 73 p refs
(Grant AF-AFOSR-3032-81; AF Proj. 2305)
(AD-A105067; AFOSR-81-0695TR) Avail: NTIS HC A04/MF A01 CSCL 20/12

Both planar thin film and channel optical waveguides have been integrated with charge-coupled devices (CCDs). Coupling of light from the waveguide region to the detector elements utilizes a smooth and uniformly-tapered region of SiO2 to minimize scattering. CCd transfer inefficiency of 1.0 times ten to the minus fourth power is consistently obtained for a number of devices. A channel waveguide array formed in a fan-out pattern is introduced as a means of enhancing focal plane resolution in integrated optical devices using optical waveguide lenses. High spatial resolution can thus be obtained without making detector spacings too small, thus avoiding detector problems with regard to fabrication, crosstalk, linearity, and charge transfer inefficiency. Operation of an integrated optical channel waveguide array-CCD transversal filter is reported. Channel waveguides formed in V-grooves couple directly to the sensor elements of the four phase, double polysilicon CCD. Experimental results include a filter transfer function having good agreement with theoretical results. The voltage contrast mode of a scanning electron microscope (SEM) is utilized to observe charge-coupled devices (CCDs) which have been cross sectioned. A new cross sectioning technique which uses anisotropic etching to accurately define the axis along which fracture occurs is presented. GRA

INFRARED REFLECTANCE AND REFRACTIVE INDEX MEASUREMENTS IN VACUUM-RATED HEMIELLIPSOIDAL MIRROR REFLECTOMETER FROM 20 TO 300 DEG K Interim Report, 1 Feb. 1977 - 1 Mar. 1979

B. E. Wood and A. M. Smith Sep. 1981 37 p refs
(AD-A105113; AEDC-TR-81-21) Avail: NTIS HC A03/MF A01 CSCL 20/6

Experimental studies have been carried out for determining the change in reflectance caused by the condensation of thin films on 77 and 20 deg. K mirror surfaces in the 20 to 25 microns wavelength range. Refractive indices of the gases condensed were measured at the He-Ne laser wavelength, 0.6328 microns. Hemispherical-directional reflectance measurements of the mirror-condensed gas composites were made using a hemiellipsoidal mirror reflectometer system. The refractive index and reflectance of condensed films of N2, O2, CO2, H2O, NH3, N2O, NO, CO, CH4, argon, air, and allene were measured. Thicknesses and refractive indices were determined using the two-angle interference technique. In addition to the reflectance measurements made on cryogenic samples, an interfacility comparison of relfectance measurements was made on several anodized metal coatings at room temperature using reflectometers at the Air Force Materials Laboratory at Wright-Patterson Air Force Base, the Convair Division of General Dynamics Corporation in San Diego, and at AEDC. Reflectance measurements were also made on a variety of salt samples (such as nitrates, sulfates, and chlorides) at room temeprature and at 77 K to demonstrate the applications available for the HEMR. THE UNIQUENESS OF PHASE RETRIEVAL FROM INTENSITY MEASUREMENTS Final Report, 1 Apr. 1980 - 31 Mar. 1981

John T. Foley Aug. 1981 57 p refs
(Grant AF-AFOSR-0162-80; AF Proj. 2301)
(AD-A105168; AFOSR-81-0679TR) Avail: NTIS HC A01/MF A01 CSCL 20/6

Several aspects of the question of the determination of the phase of a wavefield from the knowledge of its intensity in the aperture plane and focal plane of a thin lens are investigated. The role of diffraction from the lens aperture is studied. It is shown that for an astigmatic Gaussian beam this method of phase retrieval is highly nonunique if the beamwidth in the aperture plane is much smaller than the radius of the aperture. For several test cases, it is shown that if the beamwidth is not small compared to the radius of the aperture the above-mentioned nonuniqueness is removed (except for the well-known twin solution ambiguity). The twin solution is discussed and a method for eliminating it is proposed. Author (GRA)

ANISOTROPIC AND ELECTRO-OPTICAL EFFECTS IN LIQUID CRYSTALS Final Report, 1 Oct. 1976 - 30 Nov. 1980

J. David Margerum Aug. 1981 193 p refs
(Contract F49620-77-C-0017; AF Proj. 2303)
(AD-A105189; AFOSR-81-0690TR) Avail: NTIS HC A09/MF A01 CSCL 20/6

The objective of this program was to study the effects of the chemical structure of liquid crystal components on the anisotropic properties of nematic mixtures, especially in regard to their electro-optical response characteristics. The program was particularly aimed at obtaining a better understanding of the effects of components on the DS mode. A similar, secondary goal was to study the effects of structure on the VGM in some of the same nematic mixtures. We chose to study ester LCs in this program because of our prior experience with phenyl benzoate LCs and dopants for DS effects. The phenyl benzoate ester mixtures are of particular interest for DS because they are colorless and relatively stable to moisture, they can be formulated to have a negative dielectric anisotropy, they can be adequately purified for controlled doping, and they show good dc stability when used with redox dopants. In this program we have examined the properties and effects of many different types of ester LC components, including cyclohexanecarboxylates, biphenylcarboxylates, benzoylaoxybenzoates, acyloxybenzoates, and thiobenzoates, as well as various benzoate structures. PRODUCTION INTERFEROMETRIC TESTING OF DIAMOND-TURNED SURFACES

R. E. Sladky Sep. 1981 30 p refs
(Contract W-7405-eng-26)
(DE82-000172; Y-2208) Avail: NTIS HC A03/MF A01

Some of the optical interferometric tests that are used to examine the figure of diamond-turned optics are described. Some tests are routine, and the results can be statistically examined to measure the repeatability of the testing process. Interferograms are analyzed to obtain the rms or peak-to-valley errors and optical aberrations. From these data, the repeatability of the interferometric procedure is obtained. Tests show that a single interferogram can be digitized repeatedly with excellent precision, but a series of interrerograms is affected by changing environmental conditions. Precision measurements of a plated mirror over a period of time are affected by variations in the temperatures of the mirror. DOE

DEVELOPMENT OF A SMALL OPTO-ELECTRONIC DISTANCE MEASURING DEVICE Final Report

Hans Jochen Koellner Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 19 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-80-168; ISSN-0340-7608) Avail: NTIS HC A02/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 4

A miniaturized opto-electronic distance measuring device, suitable for mass production and capable of covering a variety of applications, was developed. The principle of time of flight measurement of light pulses is used. The basis of this development is a method of defining the beginning and the end of a time measurement. A prototype meeting the required technical specifications as to distance measuring range, distance and angle resolution, measuring frequency and averaging is presented. After running through a preparation phase it can be produced in large quantities in a relatively inexpensive way. Major application fields will be automation and general distance measurements.

DISRUPTION OF HIGH BETA PLASMA INDUCED BY RESISTIVE DRIFT MODE

Shinji Hiroe, Toshiju Kunibe, and Hidenori Akiyama Sep. 1981 37 p refs
(IPPJ-538) Avail: NTIS HC A03/MF A01

The observation of a disruptive instability when a high density cold plasma is injected into the ASMIC-I symmetric mirror is reported. The azimuthal mode number of the disruption is m = 0. When the plasma disrupts, it escapes both across and along the magnetic field lines. This disruption is observed only when the resistive drift instability grows near the surface of the plasma. The disruption can be suppressed when the resistive mode is stabilized. T.M.

ECR DISCHARGE CLEANING EXPERIMENT IN THE JIPP T-11

Y. Sakamoto, Y. Ishibe, S. Ishii, K. Okazaki, H. Oyama, K. Yano, N. Noda (Nagoya Univ., Japan), K. Kawahata (Nagoya Univ., Japan), Y. Kawasumi (Nagoya Univ., Japan), and S. Tanahashi (Nagoya Univ., Japan) Nagoya, Japan Nagoya Univ. Sep. 1981 22 p refs
(IPPJ-539) Avail: NTIS HC A02/MF A01

The JIPP T-2 torus device was used to find the effect of the cleaning on Tokamak discharges. To characterize the Tokamak discharge property, mean plasma resistivity, intensity of an oxygen ions spectral line and mean electron density without gas puffing were measured. The first cleaning operation for 5 hrs drastically improved the purity of the Tokamak discharge plasma. The succeeding 75 hrs cleaning gave the wall surface condition corresponding to Z(eff) = 1.5. The cleaning plasma had the electron temperature of 5 eV and density of about 10 billion cu cm with a hydrogen pressure of 0.029 Pa and a microwave power of 800 W. A.R.H.

STABILIZATION OF RAYLEIGH-TAYLOR INSTABILITY DUE TO THE SPONTANEOUS MAGNETIC FIELD IN LASER PRODUCED PLASMA

Masatada Ogasawara and Masami Takita (Keio Univ. Yokohama, Japan) Sep. 1981 17 p refs
(IPPJ-537) Avail: NTIS HC A02/MF A01

Spontaneous magnetic fields due to the temperature gradient VT0 produced by a focused laser beam on one point of a pellet are taken into account in deriving the dispersion relation of Rayleigh-Taylor instability. Growth rate (gamma) decreases with time. Density fluctuation with wavelength shorter than 1.5 (R/L sub T) x (n sub s/n sub 0) to the 1/2 power micrometer is remarkably stabilized, where R, L sub T, n sub s and n sub 0 are the radius of a pellet, L sub T/1 = (VT sub 0/T sub 0), number densities of solid and the pellet. Validity condition of the theory is gamma to sub 0 >> 1 or in another form R >> L, where t sub 0 is the time of thermal expansion of a pellet and L/1 = Vn sub 0/n sub 0. Author

END REGION AND CURRENT CONSOLIDATION EFFECTS UPON THE PERFORMANCE OF AN MHD CHANNEL FOR THE ETF CONCEPTUAL DESIGN

S. Y. Wang and J. Marlin Smith [1981] 9 p refs To be presented at the 20th Aerospace Sci. Conf., Orlando, Fla., 11-14 Jan. 1982; sponsored by AIAA
(Contract DE-AI01-77ET-10769)
(NASA-TM-82744; DOE/NASA/10769-22; E-1057) Avail: NTIS HC A02/MF A01 CSCL 20I

The effects of MHD channel end regions on the overall power generation were considered. The peak plant thermodynamic efficiency was found to be slightly lower than for the active region (41%). The channel operating point for the peak efficiency was shifted to the supersonic mode (Mach No., M sub c approx. 1.1) rather than the previous subsonic operation (M sub c approx. 0.9). The sensitivity of the channel performance to the B-field, diffuser recovery coefficient, channel load parameter, Mach number, and combustor pressure is also discussed. In addition, methods for operating the channel in a constant-current mode are investigated. This mode is highly desirable from the standpoint of simplifying the current and voltage consolidation for the inverter system. This simplification could result in significant savings in the cost of the equipment. The initial results indicate that this simplification is possible, even under a strict Hall field constraint with resonable plant thermodynamic efficiency (40.5%). N.W.

THRESHOLD CRITERIA FOR A SPACE SIMULATION BEAM-PLASMA-DISCHARGE Interim Report
E. P. Szuszczewicz, K. Papadopoulos (Science Applications, Inc., McLean, Va.), W. Bernstein (Rice Univ.), C. S. Lin (Bendix Field Engineering Corp., Columbia, Md.), and D. N. Walker 23 Sep. 1981 29 p refs
(RR0330244)
(AD-A104937; NRL-MR-4608) Avail: NTIS HC A03/MF A01 CSCL 20/9

We have conducted an experimental and theoretical study of the threshold characteristics of a space-simulation beam-plasma-discharge (BPD) with emphasis on density profiles and density-dependent ignition criteria. The study included various beam-plasma conditions covering beam currents from 8 to 85 ma, beam energies from 0.8 to 2.0 ke V and magnetic fields at 0.9 and 1.5 gauss. The study included experimental determinations of radial profiles of electron density for each of the selected conditions extending from a low-density per-BPD state to a strong BPD condition. At BPD threshold it was determined that 3.9 < or = omega p/omega c < or = 5.8 was the density-dependent ignition criterion. The experimental results are shown to agree with detailed model calculations which consider the BPD to be produced by large amplitude electron plasma waves resulting from the beam-plasma interaction. NOVEL LIMITER PUMP TOPOLOGIES
Joel E. Schultz 1981 33 p refs
(Contract DE-AC02-78ET-51013)
(DE81-030029; DOE/ET-51013/6) Avail: NTIS HC A03/MF A01

The use of limiter pumps as the principle plasma exhaust system of a magnetic confinment fusion device promises significant simplification, when compared to previous investigation of divertor based systems. Further simplifications, such as the integration of the exhaust system with a radio frequency heating system and with the main reactor shield and structure are investigated. The integrity of limiters in a reactor environment is threatened by many mechanisms, the most severe of which may be erosion by sputtering. Two novel topologies are suggested which allow high erosion without limiter failure. DOE

COMPARISON OF RESULTS BETWEEN THE BALLOONING MODES CODES BLOON AND BALOON
J. K. Munro, Jr. Aug. 1981 35 p refs
(Contract W-7405-eng-26)
(DE81-030259; ORNL/CSD/TM-157) Avail: NTIS HC A03/MF A01

Ballooning mode equation eigenvalues calculated by two different codes, BLOON and BALOON were compared for a sequence of equilibria having a range of beta values. The results agree for marginal stability only. Differences away from marginal stability may be due to differences in the coordinate systems used for the analysis in the two codes. Equilibria were generated using the ISLAND code. Results of various convergence studies made with the codes are presented together with recommendations for their use. DOE

N82-12950# Wisconsin Univ., Madison.
HIGH-MODE-NUMBER MHD STABILITY OF A TOROIDAL MULTIPOLE
M. W. Phillips Sep. 1981 25 p refs
(Contract DE-AS02-76ET-53051)
(DE81-030484; DOE/ET-53051/26) Avail: NTIS HC A02/MF A01

The stability of an axisymmetric plasma with no toroidal magnetic field is studied using a high toroidal mode number expansion of the MHD energy principle. A partial differential eigenvalue equation governing electromagnetic modes is derived. This equation is solved using a perturbation expansion with the inverse toroidal mode number as the smallness parameter resulting in two ordinary differential equations one determining the structure of the mode parallel to magnetic field lines and the other determining structure perpendicular to field lines. The equations are solved numerically for the levitated octapole and stability criteria are given. DOE

EFFECTS OF PREIONIZATION LEVEL ON A STABILIZED Z-PINCH
C. Silawatshananai, F. S. B. Anderson, M. H. Brennan, G. Durance, I. R. Jones, E. L. Murray, and J. Tendys Feb. 1980 54 p refs
(FUPH-R-164) Avail: NTIS (US Sales Only) HC A04/MF A01; DOE Depository Libraries

The influence of the degree of preionization on the formation and properties of a conventional 'stabilized' Z-pinch was studied experimentally for preionization levels ranging from 2 percent to 35 percent. It is concluded that the possibility exists of using varying levels of preionization to tailor radial profiles of density and pressure, and hence to influence the value of (ALPHA) sub (theta). DOE

SIMPLE-POWER-BALANCE MODEL FOR MICROWAVE HEATING IN EBT

D. B. Batchelor Aug. 1981 65 p refs
(Contract W-7405-eng-26)
(DE81-030428; ORNL/TM-7001) Avail: NTIS HC A04/MF A01

A simple model is presented for the production and absorption of ordinary and extraordinary mode energy in various regions of the ELMO bumpy torus plasma. The plasma is divided into two regions: (1) the low magnetic field side of the extraordinary mode cutoff and (2) the high field side of the cutoff. Energy balance equations are written for the sources (injection, mode conversion, and tunneling) and sinks (mode conversion, absorption, and tunneling) in each region, and simplified models are introduced to account for each of these processes. Since a typical ray makes several reflections from cavity wall surfaces before being absorbed, additional simplifying assumptions are made that the wave fields are an isotropic incoherent superposition of plane waves and that the energy density of each mode is uniform in a given region. DOE

INERTIAL FUSION PROGRAM Program Dates, 1 Jun. - 30 Jun. 1979

F. Skoberne, comp. Jun. 1981 196 p refs
(Contract W-7405-eng-36)
(DE81-030512; LA-8114-PR) Avail: NTIS HC A09/MF A01

Progress in the development of high-energy short-pulse carbon dioxide laser systems for fusion research is reported. Improvements for the Gemini System and the eight-beam system Helios are summarized and the 100- to 200-TW Antares target irradiation system is discussed. Other topics covered include: (1) phase conjugation by degenerate four-wave mixing and its applicability to laser fusion system; (2) frequency multiplexing as a means toward multipulse energy extraction; (3) experiments with targets designed accurate diagnostics; (4) the detection of expanding ions, neutron yield, and X-ray emission; (5) target design codes for use with the CRAY-1 computer; (6) implosion phenomena; (7) the development of a ICF reactor blanket that offers a promising alternative to the usual lithium blanket; and (8) the formulation of capital-cost data base for laser fusion reactors. SELECTED AREA GROWTH FOR DIGITAL INTEGRATED CIRCUITS AND ATOMIC PLANE DOPING OF GALLIUM ARSENIDE BY MOLECULAR BEAM EPITAXY Ph.D. Thesis

George Martin Metze 1981 244 p
Avail: Univ. Microfilms Order No. 8119457

Molecular beam epitaxy, because of its low growth rate and control (i.e., modulation) over numerous molecular beams, provides tremendous accuracy and flexibility in growing the most complex structures. Lamella doping is used to tailor doping profiles within an active region to nearly any concentration gradient and profile required. The technique doping requires the momentary suspension of growth, during which a predetermined amount of dopant (lamella) is deposited on the surface of the grown layer. Growth is then resumed and the process repeated with subsequent lamella concentrations altered to provide correct doping profiles. Another potentially important technique involves the simultaneous deposition of single crystal and polycrystalline GaAs. This planar process of selective molecular beam epitaxy was used to define and isolate single crystal GaAs regions. Dissert. Abstr.

ELECTRON FIELD EMISSION TUNNELING SPECTROSCOPY OF PLATINUM GROUP AND TUNGSTEN METALS IN THE PRESENCE OF MOLECULAR GAS AND NOBLE METAL ADSORBATES Ph.D. Thesis

Robert Louis Billington, III 1981 182 p
Avail: Univ. Microfilms Order No. 8119476

Hydrogen, carbon monoxide, oxygen, nitrogen, nitric oxide, ammonia and hydrazine were adsorbed on several crystal faces of iridium. Gold and copper were adsorbed on iridium, rhodium and platinum and on the crystal faces of tungsten. On W(100) the surface state present in the clean FEED spectrum disappears immediately as adsorption of gold and copper begins. However, at both one and two monolayer coverages, the surface state and, in fact, the entire clean energy spectrum returns. For the platinum group metals, a large binding energy anisotropy between the Ir(111) plane and the emitter surface around it is found for both gold and copper. Either metal rapidly diffuses off the flat(111) plane at 600 K. The most common result obtained in the gas adsorption experiments is that the interesting d-band energy structure found on the clean iridium surface is removed, leaving a free-electron-like FEED spectrum. Complx phenomena observed for nitric oxide are described. Dissert. Abstr.

A SYSTEMATIC STUDY OF THE EFFECTS OF 3d, 4f AND 5f IMPURITIES ON THE CRITICAL TEMPERATURE OF SUPERCONDUCTING Th; MEASUREMENTS TO 20 KILO-BARS Ph.D. Thesis

John Bradley Bulman 1981 156 p
Avail: Univ. Microfilms Order No. 8121356

Superconducting transition temperature (Tc) measurements at pressures from zero to 20 kilobars are presented on alloy systems of various impurities from the iron group, rare earth and actinide series in thorium. The alloy systems studid are classified in terms of the effect of the impurity ions on Cooper pairs. The impurity system ThCr exhibits temperature dependent pair breaking and ThMn appears to also. The systems ThNd, ThSm, ThGd, ThDy, ThHo and ThEr show evidence of temperature independent pair breaking. Measurements on the ThPr and ThTb systems suggest a crystalline electric field modified pair breaking interaction, while the ThCe is a non-magnetic pair weakening system. The Actinide impurity system ThU too is a non-magnetic pair weakening system. Analysis of the initial rate of depression of Tc vs. impurity concentration supports an increasing degree of localization of the partially filled shells, progressing from the iron group to the actinides to the rare earths. Dissert. Abstr.

EFFECTS OF UNIAXIAL STRESS ON THE SCHOTTKY-BARRIER ELECTROREFLECTANCE SPECTRA OF GaAs AND GaP Ph.D. Thesis

Michael John Bohan 1981 102 p
Avail: Univ. Microfilms Order No. 8122502

Schottky barrier electroreflectance measurements were performed on samples of GaAs and GaP under uniaxial stress.

The E sub 0 structure of GaP and the E sub 2 structure of GaAs are investigated. Values are obtained for the linear contribution to the deformation potential of the E sub 0 peak of GaP. No stress induced splittings are resolved in the E sub 2 structure of GaAs due to the large value of the broadening parameter (200 mV). Empirical nonlocal pseudopotential calculations are used to locate two nearly degenerate critical points which may contribute to the E sub 2 structure. The predicted behavior of these critical points under uniaxial stress is calculated.

THE EXTINCTION BY SMALL ALUMINUM PARTICLES FROM THE FAR INFRARED TO THE VACUUM ULTRAVIOLET Ph.D. Thesis
Janice Elaine Rathmann 1981 79 p
Avail: Univ. Microfilms Order No. 8121922

Absorption measurements were performed from .12 micrometer to 250 micrometers on small particles of Al produced by the standard inert gas evaporation technique. These were done because experimental results of Granqvist et.al. revealed a discrepancy of over three orders of magnitude with the predictions of both the classical Drude theory for spherical particles and the quantum mechanical Gor'kov Eliashberg theory. The results of Granqvist et.al. in the far IR were confirmed and the data were extended to the UV. The anomalous absorption is explained with a model using the classical Drude theory by taking into account a distribution of ellipsoidal shapes and an amorphous oxide layer, which is found to cover the particles. In order to determine the optical constants of amorphous aluminum oxide required in the calculation, a technique applicable to powdered materials was used. The model developed with the shape distribution was found to give excellent agreement with the experimental results. Several models proposed by other authors to explain the anomalous far IR absorption were also considered, but did not agree as well with the data.

NUCLEAR MAGNETIC RESONANCE STUDIES OF SOLID KRYPTON Ph.D. Thesis
Eric Irvine Maderas 1981 229 p
Avail: Univ. Microfilms Order No. 8122748

A 1.55 MHz pulsed NMR experiment was performed on solid krypton samples containing 11.55% and enriched 73.1% Kr(83). The computer controlled experiment measured relaxation times T sub 1, T sub 2c, T sub 2q and T sub 1p; T sub 1 principally reflects quadrupolar Raman relaxation of the spin 9/2 Kr (83) by thermal phonons. The T sub 1p measured with an adiabatic demagnetization in the rotating frame (ADRF) at low H sub 1 field showed two relaxation times. One was associated with the partially resolved quadrupolar non-central transitions and labelled T sub 1pg(ADRF). The other time was associated with the-1/2 to 1/2 central transition and denoted by T sub 1pc(ADRF). The ratio of T sub 1 at high field to T sub 1pq(ADRF) at low field was 4 and is discussed in terms of relaxation by independent fluctuating quadrupolar interactions. All the various T sub 1p measurements indicated a thermally activated minimum associated with atomic diffusion near 95 K. These data, together with a corresponding temperature variation in T sub 2c provided a determination of self-diffusion in solid kryton.

A STUDY OF THE PHASE TRANSITIONS IN BENZIL BY RAMAN AND BRILLOUIN SCATTERING TECHNIQUES Ph.D. Thesis
Douglas Raymond Moore 1981 163 p
Avail: Univ. Microfilms Order No. 8120570

The polarization Raman spectra exhibited by the external vibration modes of benzil were studied over the temperature range from 10 K to 300 K. Eight modes were observed above T sub c and the doubly degenerate E modes were seen to split into A and B components below T sub c. The lowest E mode exhibited considerable softening as the phase transition was approached from above and below and careful measurements near T sub c revealed a discontinuity in the Raman shift indicative of a first order transition. A series of Brillouin scattering measurements were performed on several oriented single crystals of benzil. At least squares analysis of the data led to the determination of the entire set of elastic constants at room temperature. A relatively small value of the elastic constant was found and its effect on the elastic properties of benzil is discussed.

IMPURITY RESISTANCE IN FERROMAGNETIC METALS Ph.D. Thesis
I-Min Jiang 1981 125 p
Avail: Univ. Microfilms Order No. 8120909

Two aspects of impurity resistance in ferromagnetic metals were investigated. First, the effect due to nonmagnetic impurities was investigated by considering the spin-dependent screened Coulomb potential as well as the different densities of states at the Fermi surface. It was found that the electrical resistivity increases monotonically with the increase of magnetization. This result is contrary to Neiminen's work which showed that electrical resistivity decreases when magnetization increases. Furthermore, The result also exhibited a significant difference from other results in which a resistivity minimum at low temperatures is predicted. Second, based on a dilute localized impurity spin model, the effect of magnetic impurities in a spin-polarized electron gas ated. A logarithmic divergent resistivity was found a low temperatures. This is qualitatively in agreement with the experiments. It is shown that the spin-dependent screened Coulomb potential is not able to interpret the anomalous resistivity minimum at low temperatures in ferromagnetic metals. However, magnetic impurities do contribute in a significant way to this anomaly.

MODELING OF THIN-FILM GaAs GROWTH Progress Report, 15 May - 15 Sep. 1981
John H. Heinbockel Oct. 1981 42 p refs
(Grant NAG1-148)
(NASA-CR-164992) Avail: NTIS HC A03/MF A01 CSCL 20L

A solid Monte Carlo model is constructed for the simulation of crystal growth. The model assumes thermally accommodated adatoms impinge upon the surface during a delta time interval. The surface adatoms are assigned a random energy from a Boltzmann distribution, and this energy determines whether the adatoms evaporate, migrate, or remain stationary during the delta time interval. For each addition or migration of an adatom, potential wells are adjusted to reflect the absorption, migration, or desorption potential changes.

A Hewlett-Packard digital fast Fourier transform spectral analyser was purchased and adapted for our purpose by writing several computer programs for the output display. Test jigs for devices under test and preamplifiers were built. Further, a real time dual channel correlation spectral analyzer was designed and partially built. Measurements involving temperature fluctuations and correlations in metal films and in integrated circuit transistors are described. The latter have been recently completed. It is conclusively shown that temperature fluctuations are not the cause of 1/f noise in these devices. Under the heading of theoretical work, an extensive analysis is presented of noise in diffusion systems. Several analytical models, not considered before, have been solved and the noise is presented. It is conclusively shown that volume (bulk) diffusion noise, whether based on the physical diffusion source or on Voss and Clarke's P-source, never leads to 1/f-type spectra. However, surface fluctuations as, e.g., caused by stochastic surface generation-recombination processes, can give rise to many decades of 1/f noise. This is worked out in detail for a MOSFET structure. We conclude, therefore, that the large noise observed in MOSFETs can be due to carrier number fluctuations subject to diffusion, at low frequencies the MacWhorter-van der Ziel model may be operative, whereas at higher frequencies our model takes over. Finally, in the theory section we present a novel derivation of quantum 1/f noise, occurring in emission processes. Author (GRA)

X-RAY SCATTERING INVESTIGATION OF MICROALLOYING AND DEFECT STRUCTURE IN ION IMPLANTED COPPER Progress Report
S. Spooner 26 Aug. 1981 17 p refs
(Contract N00014-78-C-0270)
(AD-A105442; GIT-E-19-664) Avail: NTIS HC A02/MF A01 CSCL 07/4

The double-crystal method for X-ray scattering analysis of radiation has been applied to the investigation of aluminum implanted copper. The interpretation of X-ray observations is based on effects of lattice strain in the surface microalloy and the presence of dislocation loops which originate from implantation damage. The copper crystal with a dislocation less than 1000 cm/cu cm was implanted with aluminum to a dose of 2 x 10 to the 16th power ions/cm with energies up to 200 keV. The response of the implanted crystal to annealing at 500 C and 600 C was determined. The quantitative use of the X-ray technique to assess implantation effects and the limitations of the technique are discussed. GRA

SURFACE STRUCTURE AND GROWTH OF CRYSTALLINE MATERIALS Final Technical Report, 15 Nov. 1979 - 14 Nov. 1980
David P. Landua 14 Jul. 1981 7 p
(Grant AF-AFOSR-0053-80; AF Proj. 2301)
(AD-A105223; AFOSR-81-0621TR) Avail: NTIS HC A02/MF A01 CSCL 20/2

Computer simulation methods have been used to study spiral crystal growth from multiple dislocation edges. The results showed that after the spiral arms had all interacted once growth proceeded in agreement with the Burton-Cabrera-Frank continuum theory. For small Frank-Read dislocations the existence of a nucleation barrier was shown. Computer simulation studies of simple models of magnetic (binary alloy) lattices with exposed surfaces were also carried out. Surface order-disorder and order-order transitions were studied as a function coupling both below and above the bulk transition surface. GRA

CHARACTERIZATION OF AS-GROWN DISLOCATION STRUCTURE IN NIOBIUM BY X-RAY DIFFRACTION TOPOGRAPHY
Stuart R. Stock, Haydn Chen, and Howard K. Birnbaum Sep. 1981 15 p refs
(Contract N00014-75-C-1012)
(AD-A105431) Avail: NTIS HC A02/MF A01 CSCL 07/4

The behavior of dislocations in b.c.c. metals has been extensively examined using relatively macroscopic methods, such as deformation studies and etch pitting, as well as with microscopic TEM methods. While these studies have led to significant increases in the understanding of dislocation behavior, the need remains for a method for studying the microscopic behavior of dislocations in relatively thick specimens. One such method, X-ray diffraction topography, has not been extensively applied due to the relatively high X-ray absorption of many of the metals of interest, such as niobium, and the consequent need to prepare highly perfect thin crystals. In the present note we report the preparation of such niobium crystals and the use of Lang topography to characterize their dislocation structures. Single crystal niobium specimens of thickness suitable for transmission topographic studies were grown by recrystallization of a heavily deformed polycrystalline ribbon of niobium. The procedure consisted of resistance heating at 2200 K and 2.6 times 10 to the minus 8th power Pa for times on the order of an hour. It should be noted, however, that due to outgassing of the niobium, protracted annealing was required to obtain this pressure. GRA

DEEP LEVELS IN AL SUB X Ga SUB 1 XAs:Fe SINGLE CRYSTALS Interim Report
Rangaiya A. Rao 1 Mar. 1981 39 p refs
(Grant AF-AFOSR-0099-80; AF Proj. 2306)
(AD-A105233; TR-81-01; AFOSR-81-0696TR) Avail: NTIS HC A03/MF A01 CSCL 20/2

Deep levels are energy levels in the bandgap of a semiconductor with activation energies which are large compared to kT. At a deep defect, the carrier wavefunction is localized near the site of the defect and, hence, delocalized in k-space. The defect can couple to a variety of phonons and interacts strongly with the lattice. Deep states generally tend to be nonradiative centers. Physically, they could result from certain chemical impurities, native defects such as vacancies, complexes involving native defects and impurities, surfaces, and interfaces. A variety of deep centers are almost always present in semiconductor crystals. They may be introduced intentionally into a semiconductor crystal by various methods. Gold introduces a deep acceptor level and a deep donor level in silicon. Gold may be evaporated onto the surface of a silicon wafer and then diffused-in by heating the wafer at a temperature of the order of 900 C for several minutes so that the gold atoms distribute themselves uniformly in the silicon crystal. Impurities like chromium and iron may be added to the melt from which GaAs, Al sub x Ga(1 sub x)As, and other semiconductors are grown by liquid phase epitaxy. Heat treatment and bombardment by energetic electrons also create deep centers in semiconductors. Deep levels affect device performance in many ways. GRA

MEASUREMENT OF PAIR-QUASIPARTICLE INTERFERENCE IN JOSEPHSON TUNNEL JUNCTIONS Final Report
Robert I. Gayley 10 Jun. 1981 43 p refs Presented at the 1980 Appl. Superconductivity Conf.
(Contract N00014-77-C-0415)
(AD-A105251) Avail: NTIS HC A03/MF A01 CSCL 20/10

A successful program for applying the microscopic theory to the computation of the time-dependent behavior of a Josephson junction has now been developed. It was based, originally, on one due to D. MacDonald of NBS Boulder, but extensive modifications had to be made in order to bring the computation time and computer memory requirements down to levels that made it possible to deal with the kinds of problems I wished to attack. Such computations are very demanding because a junction has a long 'memory'. Its behavior at some moment is dependent on its history over a long time interval in the past. It can be shown that the length of this memory is directly related to the sharpness of the voltage jump that appears in the junction current-voltage characteristic at the gap voltage. R. Harris of NBS Boulder has pointed out that real junctions do not have as sharp a jump as theory predicts, and this implies that their memories are not as long as theory suggests. I investigated this question and found that artificially shortening the theoretical memory does indeed lead to rounding of the jump at the gap voltage. I found that the amount of shortening that is required to give a reasonable rounding is in fact enough to produce an appreciable reduction in both computation time and computer memory requirements. GRA

TDPAC STUDY OF THE In2Se3 CRYSTAL STRUCTURE

Karl Krusch and John A. Gardner 17 Aug. 1981 25 p refs Submitted for publications
(Contract N00014-79-C-0668; NR Proj. 056-721)
(AD-A104729; TR-3) Avail: NTIS HC A02/MF A01 CSCL 20/2

The time-differential perturbed angular correlation (TDPAC) technique has been used to investigate the temperature dependence of the electric field gradient (EFG) at Cd impurities in the semiconducting compound In2Se3. Between room temperature and the melting point, four different phases could be observed. Most crystal structures which have been proposed for the alpha and beta phases are shown to be incorrect. The beta prime phase (550-720 C) has not been reported previously. The data suggests that the beta phase may be a Peierls distortion of the beta prime phase. The EFG in the alpha phase is well described by a simple point charge model suggesting that the electronic part of the EFG is alpha - In2Se3 is small. GRA

OPTICAL CONSTANTS OF BORON CARBIDE Final Report

James L. Lauer 14 Aug. 1981 130 p refs
(Contract N00164-79-M-2522)
(AD-A105451; NWSC/CR-RDTR-150) Avail: NTIS HC A07/MF A01 CSCL 20/6

The optical constants n and k have been determined in the 700 - 1200 per cm wavenumber region for a boron carbide flat of compressed 2 micrometer diameter particles by the polarized reflection method. A broad absorption band has been found near 1050 per cm, where k reached values of 1 to 2 and n of lower than 1.5. The scatter of the data points was large, probably because of the demonstrated presence of up to 10% of iron oxide on the surfaces (by SEM/X-ray). More accurate procedures are suggested for future work. The suspension of the particles in one arm of a Michelson interferometer is probably the most direct and superior method for obtaining n and k for such particles. Author (GRA)

AUTOMATED X-RAY ORIENTATION FOR QUARTZ CRYSTAL RESONATORS Interim Report, 1 Jul. - 31 Dec. 1980

Robert W. Birrell, Robert J. Valihura, John L. Chambers (Advanced Research and Applications Corp.), Myron A. Pugh (Advanced Research and Applications Corp.), and Thomas A. Workman (Advanced Research and Applications Corp.) Fort Monmouth, N.J. Army Electronics Research and Development Command Sep. 1981 73 p refs
(Contract DAAK20-79-C-0254; DA Proj. 1L1-62705-AH-94)
(AD-A104945; DELET-TR-79-0254-3; IR-3) Avail: NTIS HC A04/MF A01 CSCL 09/1

The objective of this program is to develop an automatic X-ray orientation system (AXROS) that is capable of measuring the angles of cut of doubly rotated (SC) quartz crystals, to an accuracy of seconds of arc, on a production basis. The technique selected for the system utilizes recognition of several major spots in a back-reflected Laue pattern in conjunction with a laser measurement of crystal surface orientation to determine the angle of cut. The pattern recognition is done via an algorithm implemented on a dedicated mini-computer. The same computer also drives servo-mechanisms used to rotate and position the crystal. A secondary objective of the program is to use the AXROS measurements to provide the input for an angle correction device to be implemented in conjunction with the AXROS. Author (GRA)

FUNDAMENTAL TESTS AND MEASURES OF THE STRUCTURE OF MATTER AT SHORT DISTANCES

Stanley J. Brodsky Jul. 1981 38 p refs Presented at the 2nd Intern. Conf. on Precision Meas. and Fundamental Constants, Washington, D.C., 8-12 Jun. 1981
(Contract DE-AC03-76SF-00515)
(DE81-030644; SLAC-Pub-2776) Avail: NTIS HC A03/MF A01

Recent progress in gauge field theories has led to a perspective on the structure of matter and basic interactions of short distances. It is clear that at very high energies quantum electrodynamics, together with the weak and strong interactions, are part of a unified theory with fundamental constants, symmetries, and conservation laws. A nontechnical introduction to these topics is given, with emphasis on fundamental tests and measurements. DOE

STUDY OF Al/Si INTERFACE BY PHOTOEMISSION, AUGER ELECTRON SPECTROSCOPIES

K. L. I. Kobayashi, J. Barth, F. Gerken, and C. Kunz Jun. 1980 15 p refs
(DESY-SR-80/08) Avail: NTIS (US Sales Only) HC A02/MF A01; DOE Depository Libraries

Photoemission, Auger electron yield, and Auger electron spectra were observed for Al/Si(111) interfaces with various Al coverage prepared by successive deposition using a moleculr beam source. The Al 3p derived states are introduced at around the top of the valence band by the Al coverage of less than one monolayer. The Al surface layer behaves as a 'metal' and the Fermi level is stabilized in the Al 3p derived states at about 0.3 eV above the top of the valence band of Si. The Schottky barrier height in this stage is about 0.8 eV and further increase in Al coverage does not change the barrier height. A covalent bonding model of the Al/Si interface based on the experimental results is proposed. The present result favors the on-top geometry of Al atoms on Si(111) surface among the geometries used in the pseudopotential calculation by Zhang and Schlueter. DOE

SILICON TRANSPORT EPITAXY Final Report

Peter Duro Braun Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 126 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie

(BMFT-FB-T-80-165; ISSN-0340-7608) Avail: NTIS HC A07/MF A01

Selective epitaxial deposition of silicon was obtained. The epitaxial growth of silicon and the conditions for selective deposition were investigated at temperatures as low as 600 C. During investigations of the dopant incorporation, anomalous behavior of n-type dopants was discovered, and called hyperdoping. A radiation heated horizontal reactor was developed. A fully developed production process for low voltage Zever diodes was realized. Silicon transport epitaxy also proves to function in an open tube process, and selective deposition can also be achieved under these conditions. The epitaxial growth allows the use of nitrogen as carrier gas. Author (ESA)

ELECTRO-OPTICAL EFFECTS IN LIQUID CRYSTALS FOR DISPLAY USE Final Report

Guenter Baur, Gerhard Meier, Hanspeter Schad, Axel Stieb, Waltraud Fehrenbach, and Friedrich Windscheid Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 119 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie

(BMFT-FB-T-80-200; ISSN-0340-7608) Avail: NTIS HC A06/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 25

Improvements of the twisted nematic liquid crystal cell are considered. The material properties of liquid crystals were investigated. The structure of the alignment defects, occurring at the edges of the electrode segments in liquid crystal layers with a small tilt angle, could be cleared up. The dependence of optical appearance on the observation angle were calculated to optimize the twisted nematic cell by variation of the material parameters. The interdependence of contrast and brightness is investigated for different types of dichroic liquid crystal cells. A figure of merit for reflective display cells is defined. Author (ESA)

Methods for series production of GaAs 0.6P0.4 layers on gallium arsenide and geranium substrates were developed. The influence of temperature, composition of the gas phase, and substrate preparation were examined and optimized. The layers were tested by Hall effect and photoluminescence measurements, and the quantum efficiency was determined by means of zinc diffused test diodes. Epitaxial layers were also successfully tested in the production lines of a German and an American light emitting diode manufacturer. Layers of GaAs(0.65)P(0.35) deposited on gallium phosphide substrates show good crystal quality, but the quantum efficiencies need further development. Cutting and polishing of gallium arsenide and gallium phosphide wafers were developed to production maturity. Author (ESA)

COLLECTIVE EFFECTS IN DIFFUSE AMBIPLASMA Ph.D. Thesis

Shelley Hill Rogers 1981 172 p

Avail: Univ. Microfilms Order No. 8120539

Astronomical observations reveal no signs of antimatter on a large scale. If matter and antimatter exist in separate regions without, in effect, interacting there must be a repulsive force between the matter and antimatter that prevents them from mixing; in particular, such a force is crucial to the coexistence of large, diffuse regions akin to the galactic interstellar clouds. A previously proposed mechanism in which a thin, magnetized layer of ambiplasma keeps matter and antimatter plasmas separated with the energy released in occasional annihilation to dynamic collisions between diffuse regions and specifically to collisions between unmagnetized plasmas and between magnetized atomic clouds. A model for the generation of magnetic fields by an electromagnetic instability was developd from Vlasov and quasi-linear theories. The character of collisionless shocks driven by annihilation-electron currents was derived by matching four physical requirements self-consistently. Dissert. Abstr.

ANALYTICAL EXPRESSIONS FOR SPECIFIC HEATS AND ISENTROPIC EXPONENTS OF HIGH-TEMPERATURE GASES WITH THEIR APPLICATIONS

Riichi Matsuzaki and Noriaki Hirabayashi 1981 46 p refs In JAPANESE; ENGLISH summary

(NAL-TR-671; ISSN-0389-4010) Avail: NTIS HC A03/MF A01

Exact analytical expressions for the specific heats and isentropic exponents were obtained for several sets of high temperature gases composed of dissociated and ionized species in thermodynamic equilibrium. The sets of species considered are: monatomic gas (A, A+, A++, e-), pure diatomic gas (A2, A, A2+, A+, e-), heteronuclear diatomic gas (AB, A, B, AB+, A+, B+, e-), triatomic gas (AB2, A2, B2, A, B, AB, A2B), and a model air (O2, N2, O, N, NO, O+, N+, NO+, O2+, N2+, e-). For another model of air including Ar and Ar+, an approximate method for calculating specific heats and isentropic exponents is proposed. Second virial correction terms for thermodynamic properties are also derived analytically. The corrected values of the specific heats and isentropic exponents at high density reveal better agreement with available tables. Debye-Huckel correction can be neglected in the present ranges of temperature and pressure. Simple applications to the study of equilibrium flow of air around a corner and in a nozzle show that these analytical expressions are useful in practical purposes. R.J.F.

DEVELOPMENT OF A THERMODYNAMIC PROPERTIES CORRELATION FRAMEWORK FOR THE COAL CONVERSION INDUSTRY, PHASE 1A Annual Report, 1 Sep. 1980 - 31 Aug. 1981

K. E. Starling, L. L. Lee, K. H. Kumar, M. R. Brule, S. Watanasiri, V. Gupta, M. H. Li, R. McFall, W. Chang, C. K. So et al 1981 33 p ref

(Contract DE-FG22-80PC-30249)

(DE81-030363; DOE/PC-30249/T2; AR-1) Avail: NTIS HC A03/MF A01

A three-parameter corresponding states framework developed originally for light hydrocarbons was modified to rapidly develop a practical thermodynamic properties prediction capability for the coal conversion industry. The three-parameter corresponding states correlation describes the thermodynamic behavior of pure nonpolar and slightly polar nonassociating coal fluids and mixtures for which the mixture constituents are known. Characterization techniques are outlined for converting distillation analysis of underfined mixtures (with composition available in terms of broad fractions) into representative pseudo components. Empirical correlations are developed to estimate the three corresponding states characterization parameters for each fraction from measurements made on the fraction (boiling point, specific gravity, molecular weight). Results for one and two ring polar and associating coal fluids indicate that an extension of the corresponding states methodology to associating fluids using a five-parameter correlation is possible. DOE

AN EXPLORATORY STUDY OF COSTS TO OPERATE GOVERNMENT-OWNED, CONTRACTOR-OPERATED (GOCO) FACILITIES M.S. Thesis

William O. Bennett and Mark L. Hodges, Jr. Jun. 1981 124 p refs

(AD-A104854; AFIT-LSSR-43-81) Avail: NTIS HC A06/MF A01 CSCL 05/1

During World War II, the U.S. Government recognized a need to expand the nation's industrial base. The government decision was to build production facilities and contract with private firms to operate them. In 1970 the Secretary of Defense issued a directive to sell many government facilities. As of 1980, 147 remained in government possession, being managed differently by each DOD component. The researchers sought to determine if management structure impacted upon operational costs of GOCOs. The researchers discovered that operational cost data were not readily available DOD-wide. A study of Army ammunition GOCOs was conducted to determine if sufficient correlation between costs of operating GOCOs could be found to justify the expense of data collection for hypothesis testing. The results of the study showed positive correlation between operation and maintenance costs of GOCOs and total costs of GOCOs. Production costs were not found to be significantly correlated to operation and maintenance costs. Evidence of a structural variable impacting upon production cost was found. The study recommended further study to refine the cost data, then further research into operational costs and management structure. Author (GRA)

AN APPROACH TO THE MANAGEMENT OF HAZARDOUS MATERIALS Final Report

J. V. Zaccor, H. L. Hsu, and C. Wilton Sep. 1981 103 p refs

(Contract EMW-C-0432)

(AD-A104869; SSI-8043-4) Avail: NTIS HC A06/MF A01 CSCL 13/12

This report describes an approach to hazardous material emergency management that includes organizing, relating, and keeping track of decision information being developed in the various operating sectors. Ongoing hazardous materials data collection, done by different Federal, State, local, and private agencies, is not coordinated. A simple, pragmatic decision information system with a standard data acquisition format is needed. A matrix approach, where data are acquired and developed to determine ranking problems, may be an answer. Information exchange media are examined and assessed for potential effectiveness in transferring the acquired and developed information to the area where information needs are greatest - the level of first responder. Test communities should be established to participate in information exchange programs. Author (GRA)

ASSIGNMENT TECHNIQUES FOR HEAVILY LOADED NETWORKS [TOEDELINGSTECHNIEKEN VOOR ZWAAR BELASTE NETWERKEN]

H. E. R. Meinjer Delft Netherlands Organization for Applied Scientific Research TNO Oct. 1979 38 p refs In DUTCH

(A-79-VK-45-07) Avail: NTIS HC A03/MF A01

A survey of the most important assignment methods is presented. It is based on literature reviewing, except for the equilibrium assignment method and it is limited to models for one traffic method with fixed demands, where the effects of congestion on the assignment result are taken into account. The two equilibrium methods treated use a monotonically increasing function linking current and resistance, and result in a unique solution where all the employed routes between origin and destination have the same resistance and the nonemployed routes have higher resistance. COMPUTER-BASED NATIONAL INFORMATION SYSTEMS: TECHNOLOGY AND PUBLIC POLICY ISSUES

Sep. 1981 203 p refs

(OTA-CIT-146; LC-81-600144) Avail: SOD HC

Developments in computer and information management technology and their impact on society are discussed. Among the issues discussed are the following: innovation, productivity, and employment; privacy, security of computer information; government management of data processing; society's dependence on information systems; and the constitutional rights and regulatory boundaries affected by information systems. For individual titles, see N82-12990 through N82-13003.

COMPUTER-BASED NATIONAL INFORMATION SYSTEMS: TECHNOLOGY AND PUBLIC POLICY ISSUES. SUMMARY

In its Computer-based Natl. Inform. Systems Sep. 1981 p 3-25 (For primary document see N82-12989 03-82)

Avail: SOD HC

The structure of information policy issues was examined. Information policy, law, and regulation were studied. System issues, information issues, secondary policy impacts, and long-term societal effects are discussed. Government management of data processing and its implications are also discussed. T.M.

N82-12991# Office of Technology Assessment, Washington, D. C.

BACKGROUND AND PURPOSE OF THE STUDY

In its Computer-based Natl. Inform. Systems Sep. 1981 p 29-34 (For primary document see N82-12989 03-82)

Avail: SOD HC

As computer-based national information systems become more important to American society, particularly for Government administration, they create corresponding public policy problems. These problems are discussed and include: the design, procurement, and operation of Government data systems; the potential for Government agencies to abuse the large record systems they operate that contain personal data; the effects of computer technology on the structure and operations of the banking industry; the role of the Postal Service in providing electronic message service; problems concerned with the protection of privacy and constitutional rights presented by the use of large automated data systems; and the impact of information technologies on copyright laws. T.M.

INFORMATION SYSTEMS AND COMPUTERS

In its Computer-based Natl. Inform. Systems Sep. 1981 p 37-43 refs (For primary document see N82-12989 03-82)
Avail: SOD HC

Computers carry out a wide variety of tasks associated with processing information. It is important to understand the entire range of these capabilities in order to appreciate the nature and magnitude of the potential social impacts of this technology when used in information systems. Computer capabilities are discussed and include: data collection, information storage, information organization, calculations, communication, information presentation, and numerical control. T.M.

N82-12993# Office of Technology Assessment, Washington, D. C.

INFORMATION IN SOCIETY

In its Computer-based Natl. Inform. Systems Sep. 1981 p 47-54 refs (For primary document see N82-12989 03-82)
Avail: SOD HC

The nature of information is discussed. The commercial value, public value, and private value of information are considered. The role of information as an economic commodity on the development of the economy was examined. T.M.

N82-12994# Office of Technology Assessment, Washington, D. C.

THE STRUCTURE OF INFORMATION POLICY

In its Computer-based Natl. Inform. Systems Sep. 1981 p 55-61 refs (For primary document see N82-12989 03-82)
Avail: SOD HC

Current policies governing information systems are a composite of many specific regulations and laws, which are based on three main factors: the areas affected or the regulatory concerns (privacy, freedom of information, etc.); the affected sector of society (banking, education, Government, etc.); and the lawmakers and/or rulemakers (Congress, the Federal Communications Commission, State legislatures, etc.). Areas of law and regulation that affect information systems or are affected by them are discussed. T.M.

N82-12995# Office of Technology Assessment, Washington, D. C.

INNOVATION, PRODUCTIVITY, AND EMPLOYMENT

In its Computer-based Natl. Inform. Systems Sep. 1981 p 65-70 refs (For primary document see N82-12989 03-82)
Avail: SOD HC

The structure of innovation and product development in the computer industry is discussed. Basic research in computer science is based on the technology rather than on physical laws. Thus, the leadtime between a fundamental theoretical advance in computer science and a practical application is, in general, relatively short, a few years of less. The vitality of the industry is in part based on the vitality of academic computer science and industrial computer science. The competition between the university and the commercial laboratories are highlighted. T.M.

N82-12996# Office of Technology Assessment, Washington, D. C.

PRIVACY

In its Computer-based Natl. Inform. Systems Sep. 1981 p 73-78 refs (For primary document see N82-12989 03-82)
Avail: SOD HC

Policy issues related to privacy were reviewed on a historical basis. Future privacy issues are discussed and include: an omnibus versus a selective policy on recordkeeping issues, the collection of data, access, and microprocessors and surveillance. T.M.

N82-12997# Office of Technology Assessment, Washington, D. C.

THE SECURITY OF COMPUTER SYSTEMS

In its Computer-based Natl. Inform. Systems Sep. 1981 p 81-86 refs (For primary document see N82-12989 03-82)
Avail: SOD HC

The technology of security was surveyed. Threats and targets were determined and include: theft, sabotage, data alteration, blackmail, extortion, corporate espionage, systems failure, and service interruption. Future security issues are discussed with emphasis on protection of Federal systems and vital domestic information systems. T.M.

N82-12998# Office of Technology Assessment, Washington, D. C.

GOVERNMENT MANAGEMENT OF DATA PROCESSING

In its Computer-based Natl. Inform. Systems Sep. 1981 p 89-94 refs (For primary document see N82-12989 03-82)
Avail: SOD HC

The problems that arise from the Federal Government falling behind the private sector in its use and management of up to date computing technology are discussed. Potentially lost opportunities to use the newest technology to improve the efficiency and effectiveness of Government programs, and increased cost and decreased reliability resulting from operating systems that are becoming obsolete from archaic management procedures are highlighted. T.M.

N82-12999# Office of Technology Assessment, Washington, D. C.

SOCIETY'S DEPENDENCE ON INFORMATION SYSTEMS

In its Computer-based Natl. Inform. Systems Sep. 1981 p 97-102 refs (For primary document see N82-12989 03-82)
Avail: SOD HC

System failures and their implications are discussed. The calculation, assignment, and management of the risks involved with information system failures, were examined. T.M.

N82-13000# Office of Technology Assessment, Washington, D. C.

CONSTITUTIONAL RIGHTS

In its Computer-based Natl. Inform. Systems Sep. 1981 p 105-112 refs (For primary document see N82-12989 03-82)
Avail: SOD HC

Little legal precedent exists, in many cases, for applying constitutional law to the issues raised by computer based information systems. These issues will become incorporated into existing legal precedent. Five areas of constitutional law that may be affected by information systems were examined and they are the first, the fourth, the fifth, the sixth, and the fourteenth ammendment rights. T.M.

N82-13001# Office of Technology Assessment, Washington, D. C.

REGULATORY AND OTHER ISSUES

In its Computer-based Natl. Inform. Systems Sep. 1981 p 115-120 (For primary document see N82-12989 03-82)
Avail: SOD HC

As computer based information systems evolve, they challenge traditional concepts of boundaries - physical or social - that are reflected in the law and regulatory policy. The integration of computer and communication technologies form systems that cross boundaries between nations, states, and organizations. The issues of transborder data flow computer crime, computer software protection, and information gap are discussed and exemplify the kinds of problems created by such integration. T.M.

N82-13002# Office of Technology Assessment, Washington, D. C.

TRENDS IN COMPUTER TECHNOLOGY

In its Computer-based Natl. Inform. Systems Sep. 1981 p 123-143 (For primary document see N82-12989 03-82)
Avail: SOD HC

Computer technology is advancing rapidly. To assess the impacts of information systems, the current state of this technology and where it is heading must be understood. The capability that information technology puts in the hands of the computer user determines the nature of the applications that are developed. Developmental trends shaping the nature of the information based services that will be provided in the coming decade are discussed. T.M.

N82-13003# Office of Technology Assessment, Washington, D. C.

INDUSTRY STRUCTURE

In its Computer-based Natl. Inform. Systems Sep. 1981 p 147-166 (For primary document see N82-12989 03-82)
Avail: SOD HC

The companies examined range widely in size. While the market is clearly dominated in terms of size by the top eight (70 percent of the total revenues), much of the significant market shifting and innovation that will affect the future of computer use are taking place among the smaller companies. The top eight companies are those marketing full lines of general purpose computers, referred to in the industry as mainframe computers. The rest succeed, in general, by focusing on a more limited market sector - very small machines, very large machines, specialized peripheral hardware, or various types of computer services. T.M.

N82-13004 California Univ., San Diego.

REDUNDANCY VERSUS QUERY TIME TRADE-OFFS FOR DATA STRUCTURES Ph.D. Thesis

Dennis James Volper 1981 168 p
Avail: Univ. Microfilms Order No. 8120546

Trade-offs and lower bounds on several data retrieval problems are exploded. The three problems considered are the Range Query problem, the Partial Mach Query problem, and the Slotted Retrieval problem. In the Range Query problem data structure which return the sum of the contents of a contguous portion of an array are studied In the Partial Match Query problem data structure which return the sum of record whose keys match a given partial pattern are studied. In the Slotted Retrieval problem are examined. Data in the Slotted Retrieval problem data structure which return the sum of all but one of the elements in an array are examined. This problem is used to illustrate a situation in which the usual method does not provide a good lower bound. It is also used to illustrate that a data problem which allows solutions that use subtraction can be solved by a more powerful data structure than one which allows only addition. Dissert. Abstr.

N82-13005 California Univ., Los Angeles.

ABSTRACT DATA TYPES AND DATA BASES Ph.D. Thesis

Paolo Paolini 1981 306 p
Avail: Univ. Microfilms Order No. 8121028

Abstract data types (ADTs) describe data through a set of operations and their properties. They are used to write specifications for data behavior and to define programming languages which treat data as abstract objects (i.e., instances of ADTs). Data models for data bases are formally specified as ADTs. Therefore the correctness of their implementation is proven, and the properties of the programs which use them is derived. A technique, based on algebraic definitions of ADTs, is useful for formal definition of data models. Transactions which operate upon a data base are described as abstract operations. A particular technique is developed to formally describe a transaction and to prove the correctness of its implementation. Dissert. Abstr.

VIDEO DISCS: THEIR APPLICATION TO INFORMATION STORAGE AND RETRIEVAL

Alan Horder Jun. 1979 42 p refs
(NRCd-12; ISBN-85267-1709) Copyright. Avail: Issuing Activity

The development of video disks is traced. The main systems are described. Specialized applications in education and industry, e.g. in libraries or advertising, are discussed. Uses in information retrieval are analyzed. Optical systems are most suitable since there is no physical contact between disk and stylus. There is less deterioration in playback quality as a result. Video files have a potential information capacity of 6 billion bits, i.e. 7000 to 8000 times more dense than microfilm. Author (ESA)

DEFENSE TECHNICAL INFORMATION CENTER FREE TEXT EXPERIMENT: TECHNICAL REPORT FILE Final Report, Dec. 1979 - Jan. 1981

John L. Carney, Carlynn J. Thompson, and Charles D. Edmondson Oct. 1981 39 p
(AD-A105449) Avail: NTIS HC A03/MF A01 CSCL 05/2

DTIC has conducted an experiment that utilizes the free text inversion technique to retrieve records from the Technical Reports data base. It was felt that free text inversion as a form of retrieval would be beneficial in supporting DTIC's revitalized role in the transfer of technical information. The intent of this project was to determine if the free text inversion technique could be implemented on the DROLS on-line system without severely impacting the on-line system's storage capacity and to determine whether the added capability could improve upon or replace the present practice of using open-ended/identifier indexing terminology. Based on the results of the experiment, it was determined that searching of DTIC's Technical Reports data base is a viable retrieval technique that will provide searchers with an additional enhancement that can be used to augment DTIC's present retrieval methods. However, evidence that will support the use of free text in lieu of the use of identifiers and open-ended terminology remains inconclusive. Additional data collected in a 'live environment' will have to be analyzed before a conclusion can be made concerning the use of open-ended terminology. GRA

PRELIMINARY INTERNAL DATA SCREENING: A COMPONENT OF QUANTITATIVE DATA ANALYSIS IN DATA VALIDATION

David J. Pack Sep. 1981 35 p refs
(Contract W-7405-eng-26)
(DE81-000502; ORNL/CSD-85) Avail: NTIS HC A03/MF A01

Internal data screening is validation of data by quantitative internal comparisons across records for a given variable, across variables for a given record, across time for a given variable and record, etc. Preliminary internal data screening has the objectives of producing: (1) a frozen, archived data base ready for efficient computer analysis, and (2) a general understanding of key variables, a rough cut at response meaningfulness, a qualification of the type of error present, and an assessment of the expected level of difficulty in the comprehensive validation. The first objective is defined and seen to be achievable through simple computer methodology. Methodological suggestions for accomplishing objectives centering exploratory data analysis techniques of Tukey are made, recognizing these techniques appropriateness for a general examination of a large data base that may contain numerous errors. A GENERAL THESAURUS FOR THE GERMAN LIBRARY. PILOT STUDY Final Report

Ingetraut Dahlberg Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 74 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-ID-80-015; ISSN-0170-8996) Avail: NTIS HC A04/MF A01

The kind and form of the terms used by the Deutsche Bibliothek (DB) were analyzed for subject description and tested for their suitability as elements of a general library thesaurus. The possibility and fundamental principles of such a thesaurus, its necessary structure (coverage of subject fields, number of main groupings, depth of hierarchy), the necessary relationships (conceptual and terminological), possibilities of delimitation of the number of terms, the treatment of names and the possibilites of terminological control are considered. The DB terms are considered suitable for a thesaurus, but must be supplemented by terms which may partly be taken from the total of reference terms in order to establish the necessary links to hierarchically higher concepts. (Contract ESA-4421/80/F-FC(SC))
(ESA-CR(P)-1457) Avail: NTIS HC A04/MF A01

The METEOSAT concept through its development and well into its expected operational mode, up to 1990 was analyzed. Account was taken of the disturbance introduced by the METEOSAT 1 failure in November 1979, of the delay in the launch of METEOSAT 2, and of the uncertainties arising from the lack of decision, at the end of 1980, on the operational METEOSAT follow-on. Results show important positive economic effects both for the users community (direct benefits) and for the contracting industry concerned (induced benefits).

ANALYSIS OF INTEGRATED FUEL-EFFICIENT, LOW-NOISE PROCEDURES IN TERMINAL-AREA OPERATIONS
J. B. McKinley Jan. 1981 125 p refs
(Contract DE-AC01-80CS-50141)
(DE81-029833; DOE/CS-50141/T1) Avail: NTIS HC A06/MF A01

The specific aviation energy conservation issues, terminal area fuel conservation and airport noise level relationships, are investigated. The potential fuel savings and noise level reduction in the Los Angeles International (LAX) terminal area between 1980 and 1990 attributable to compliance with the noise requirements of FAR Part 36 were quantified. These savings are due to the retiring, retrofiting and re-engining of older narrow-body aircraft (DC-8, B707, etc.) and the growth of wide body aircraft operations (DC-10, B747, B767, etc.). Current noise abatement procedures that could be relaxed without adversely impacting current (1980) noise levels, and at the same time conserving additional fuel. Two FAA computer models were used. The Integrated Noise Model (INM) Version 2.7, was used for noise analysis, and INKMOD, a preliminary fuel burn model, for the fuel analysis. The results of this detailed analysis revealed that due to the changing aircraft mix at LAX to include more wide body aircraft and fewer narrow body aircraft operations, airport noise level will decrease by 8.5 and 9.2 square miles on the 75 Ldn contour for 1985 and 1990, respectively, from the 1980 baseline.

METHOD FOR ESTIMATING TECHNOLOGICAL PENETRATION RATES IN COMMERCIAL AUTOMOBILE FLEETS
J. R. Wagner Nov. 1980 84 p refs
(Contract DE-AC02-76CH-00016)
(DE82-000433; BNL-51312) Avail: NTIS HC A05/MF A01

A technique for estimating market penetration rates of electric and hybrid cars in commercial (including police and nonfederal government) fleets is described. The approach is also applicable to other vehicle technologies in the fleet market. It employs survey data cllected from 142 fleet operators in March 1979. The data describe physical and economic criteria used by fleet operators to select vehicles. This information, together with a variety of derived relationships and constants, provides the basis for a computer simulation model called CPEN (Fleet Car Market Penetration Simulatos). The hypothetical vehicles. The CPEN then produces market penstration estimates, based on the physical capabilities, purchase prices, and discounted life-cycle costs of alternative vehicles.

WET AIR OXIDATION OF WASTE WATER Final Report
Gerhard Friedhofen, Hans Karres, Joerg Rosenbaum, and Reinhard Thiel Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 42 p refs In GERMAN; ENGLISH summary

Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-80-132; ISSN-0340-7608) Avail: NTIS HC A03/MF A01

In order to solve ecological problems, research in laboratories and technical schools on the purification of chemically contaminated waste water by wet air oxidation was carried out and resulted in the construction of a prototype technical plant. The plant is designed for purifying waste water with 12 to 15 t/day organic substances at 320 to 330 C and 160 to 180 bar, and with conversion rates of up to 97%. Inorganic substances in solution can be recycled while the heat of reaction is utilized for steam production. The plant operates at lower costs than biological waste water treatment. Author (ESA)

STUDY ON A REFINED IMAGE PROCESSING SYSTEM FOR SPACE ASTRONOMY
E. Golton Paris ESA Mar. 1981 258 p
(Contract ESA-4134/79/D-IM(SC))
(ESA-CR(P)-1458) Avail: NTIS HC A12/MF A01

The Madrid IUE data processing systems are reviewed. Recommendations for extending the standby experiment display system (EDS) to provide an offline interactive analysis facility are made. Software design to meet user requirements uses EDS color raster graphics hardware; it evolves in top-down fashion driven by the requirements, and is modular and open ended. It is based on a series of interacting tasks, giving the user power to intermix and overlap analytic processes, and making for maximum power and flexibility. Data and formats likely to be generated by future astronomical satellites are considered and the possibility of common standards and processing requirements is investigated. All such data can be held within a file structure, and can be processed for many applications using a common suite of display and analysis programs. Designs based on an extended EDS computer, a supermini computer, a pipeline processor, and a parallel array processor are presented. Author (ESA)

A series of research tasks were undertaken to assess the potential fuel economy improvements for passenger cars and light trucks during the 1980 to 1985 time frame, and later to 1990. Specific subject areas of investigation include: spark ignition engine improvements; fuel economy potential of aternate engines; reductions in tire rolling resistance, aerodynamic drag, and engine friction (through improved lubricants); weight reduction of domestic and certain import passenger vehicles, including a teardown of a Chrysler - Dodge Omni for an analysis of materials and weight and a technology assessment of carbon composites as a future substitute materials. Manufacturing and consumer costs for the fuel economy improvement areas identified, identification of unregulated diesel emission problem areas in need of research and a determination of the cost benefits of petroleum conservation by means other than fuel economy standards are included. X-RAY IMAGING OBSERVATIONS OF THE RADIO GALAXIES CEN A, VIR A, AND 3C273 Ph.D. Thesis
Eric Dennis Feigelson 1980 252 p
Avail: Univ. Microfilms Order No. 8120241

Two dimensional X-ray images of three radio galaxies obtained with the high resolution imager and imaging proportional counter on board the Einstein X-ray Observatory (HEAO-b satellite) are reported. Several distinct sources of X-ray emission in these galaxies including the active nucleus, hot interstellar medium, stars, radio lobes and jets are revealed. X-ray jets in all three of these galaxies, demonstrate that highly energetic processes occur in the transport of energy and matter from radio galaxy nuclei to lobes. The strongest evidence to date for inverse Compton X-ray emission from extended radio lobes, and for hydrostatic (in contrast to ram) pressure confinement of radio lobes by a hot external medium is observed. (NASA-CR-164986) Avail: NTIS HC A02/MF A01 CSCL 03A

The IUE satellite observatory was used to obtain absolutely-calibrated emission line fluxes for diagnostic lines of multiply-ionized C, N, O, Si, Ne, and Ar which occur in the ultraviolet spectral region of planetary nebulae. These data, when combined with data from the blue, visual, and near infrared, provide improved estimates of ionic concentrations, plasma temperatures and densities, and elemental abundances. B.W.

ALIGNMENT OF THE CASSEGRAIN AND COUDE OPTICS OF THE 3.8m UK INFRARED TELESCOPE; ASSESSMENT OF THE OPTICAL PERFORMANCE AND RESULTS OF ABERRATION CALCULATIONS
D. S. Brown (NEI Grubb Parsons), C. M. Humphries, T. E. Purkins, and R. V. Willstrop (Cambridge Univ., England) 1 Feb 1981 39 p
(UKIRT-10; ISSN-0260-9983) Avail NTIS HC A03/MF A01

The alignment procedures used for the f/9 and f/20 systems of the United Kingdom infrared telescope (UKIRT) are described. For the f/9 system, the primary mirror was positioned radially so that it was centered in the mirror cell by equalizing the combined signals from opposite pairs of the load cells incorporated in the mirror cell. An alignment telescope (AT) was mounted on a flange bolted to the rotatable instrument flange of UKIRT. An alignment fixture was positioned so as to provide an accurate ground surface on which the AT bullseye target reflector could be mounted. Improved performance resulted when the AT was replaced by a Hartmann camera with eyepiece and graticule. Spherical aberration is introduced into the image when the focal plane is displaced axially from the optimum position. Coma results, primarily from misalignment of the primary and secondary mirrors. Astigmation of 0.232 arc sec, are reported for the primary mirror. Author (ESA)

METALLIC FILM THICKNESS REQUIREMENTS FOR MIRRORS IN THE INFRARED
C. M. Humphries and H. Seddon 25 Feb. 1980 14 p refs
(UKIRT-13; ISSN-0260-9983) Avail NTIS HC A02/MF A01

The thickness requirements for mirrors used at wavelengths up to 100 microns and, possibly, up to 1 mm are given. The experimental and calculated reflectance data for aluminum, gold, and nickel coatings in the infrared region are shown. The penetration depth given by d = lambda/4 pi k2 is considered a satisfactory criterion for determining the thickness required for evaporated metallic films. Aluminum coating thicknesses of 1000A give penetration depths sufficient for wavelengths up to 100 microns. Reflectance for three UKIRT mirrors in series is 97% of maximum overall reflectance. Nickel requires thicker coatings than gold, and gives lower maximum reflectances than aluminum in the 0.5 to 10 micron band. The maximum reflectance from gold is slightly higher than aluminum from 2 to 10 microns and thicker coatings are required. At 1 micron the maximum reflectance from gold is significantly higher than of aluminum, but lower at 0.5 microns. Author (ESA)

THIN MIRROR TELESCOPES: EXPERIENCE GAINED WITH THE UK INFRARED TELESCOPE
C. M. Humphries 1 Mar. 1980 9 p ref Presented at Opt and IR Telescopes for the 1990's Conf., Tuscon, Arizona, Jan. 1980
(UKIRT-14; ISSN-0260-9983) Avail NTIS HC A02/MF A01

The United Kingdom's infrared telescope has f/q Cassegrain and f/20 coude focal planes and the additional option of an f/35 Cassegrain chopping secondary mirror. The optical system including contributions from the secondary mirror, the respective support systems, and atmospheric viewing gives a Cassegrain image of diameter 1 arcsec (90% incident radiation) and a coude image of diameter 1.25 arcsec. A thin mirror approach is used both for primary and secondary mirrors. The lightweight design concept can be applied to altazimuth as well as equatorial designs and to optical as well as to infrared ground based telescopes. It can be used in conjunction with the segmented or multiple mirror approach. Author (ESA)

COMPUTER AIDED BALANCING OF UKIRT: A PRELIMINARY REPORT
A. McLachlan 14 Mar. 1980 8 p
(UKIRT-15; ISSN-0260-9983) Avail NTIS HC A02/MF A01

A combination of mechanical and computer techniques used in balancing UKIRT is described, and the computer program used is presented. The balance in one axis of an out of balance telescope can be examined by driving the telescope along the axis towards a given point from opposite directions. At the position, for each direction of movement, the difference between the position demanded and the encoder is calculated. The sum of differences is an indication of the out of balance moment. For a perfectly balanced telescope the sum is zero. Several measurements at different positions of the telescope are necessary to determine the position of the center of gravity relative to the pivot point. Author (ESA)

TOPICS IN THE EVOLUTION OF COSMOLOGICAL PERTURBATIONS Ph.D. Thesis
Ethan Tecumseh Vishniac 1980 217 p
Avail: Univ. Microfilms Order No. 8120244

The evolution of perturbations of the standard Friedmann cosmology at early times is studied. Special emphasis is placed on those perturbations that remain regular as one approaches the initial singularity. The nature of perturbations much larger than the particle horizon are discussed. A number of widespread beliefs are shown to be incorrect and results are obtained concerning the effect of local variations in the equation of state. Next the growth of perturbations are epochs when a substantial fraction of the energy content of the universe was contained in a collisionless neutrino gas examined. Most perturbations that diverge at early times are strongly affected by the neutrinos. The effect of nonlinear interactions on the evolution of adiabatic perturbations whose scale is much less than the particle horizon. Finally, the evolution of adiabatic perturbations is followed through the era of recombination. The shortest wavelength perturbations that emerge from recombination without suffering attenuation are larger than the largest scale nonlinear clustering observed in the present universe. Dissert. Abstr.

(NASA-CR-166749; CAL-1471) Avail: NTIS

HC A03/MF A01 CSCL 03B

The documentation and software programs developed for the reception, initial processing (quickbook), and production analysis of data obtained by solar X-ray spectroscopy, stellar spectroscopy, and X-ray polarimetry experiments on OSO-8 are listed. The effectiveness and sensitivity of the Bragg crystal scattering instruments used are assessed. The polarization data polarimetric data obtained shows that some X-ray sources are polarized and that a larger polarimeter of this type is required to perform the measurements necessary to fully understand the physics of X-ray sources. The scanning Bragg crystal spectrometer was ideally suited for studying rapidly changing solar conditions. Observations of the Crab Nebula and pulsar, Cyg X-1, Cyg X-2, Cyg X-3, Sco X-1, Cen X-3, and Her X-1 are discussed as well as of 4U1656-53 and 4U1820-30. Evidence was obtained for iron line emission from Cyg X-3. A.R.H.

THE UNIVERSE: PAST AND PRESENT REFLECTIONS

Fred Hoyle May 1981 66 p refs

(Preprint-70) Avail: NTIS HC A04/MF A01

The age of the universe is considered. The big bang theory is attacked on the grounds that it does not allow enough time for life to develop. The chance of a random shuffling of amino acids producing a workable set of enzymes is estimated at less than 10 to the minus 40,000th power. The big bang theory postulates 10 billion years as the age of the universe. The initial stages would have been unsuitable for the generation of life because of the harmful radiation present. The biochemical structure of enzymes has changed little during the past 4 billion years. The time remaining is too short, so the Universe must be older than 10 billion years. Moreover, since the Universe is defined as 'everything' it is illogical to limit it in time. Time is part of the Universe, not one of its limiting characteristics. Author (ESA)

THE RIGID SHELL COMPONENT FOR SUPERROTATION IN PLANETARY ATMOSPHERES: ANGULAR MOMENTUM BUDGET, MECHANICAL ANALOG AND SIMULATION OF THE SPIN UP PROCESS

H. G. Mayr and I. Harris Sep. 1981 47 p refs Presented at the 12th Ann. Meeting of the Div. for Planetary Sci. of the Am. Astron. Soc., Tucson, Ariz., Oct. 1980

(NASA-TM-83831) Avail: NTIS HC A03/MF A01 CSCL 03B

An analysis of superrotation in the atmosphere of planets, with rotation axis perpendicular to the orbital plane is presented. As the atmosphere expands, Hadley cells develop producing a redistribution of mass and angular momentum. A three dimensional thermally driven zonally symmetric spectral model and Laplace transformation simulate the time evolution of a fluid leading from corotation under globally uniform heating to superrotation under globally nonuniform heating. For high viscosities the rigid shell component of atmospheric superrotation can be understood in analogy with a pirouette. During spin up angular momentum is transferred to the planet. For low iscosities, the process is reversed. A tendency toward geostrophy, combined with increase of surface pressure toward the poles (due to meridional mass transport), induces the atmosphere to subrotate temporarily at lower altitudes. Resultant viscous shear near the surface permits angular momentum to flow from the planet into the atmosphere propagating upwards to produce high altitude superrotation rates. M.D.K.

ON THE GLOBAL CIRCULATION AND THE HURRICANE SYSTEM OF THE JOVIAN ATMOSPHERE

H. G. Mayr, K. Meada, and I. Harris Sep. 1981 22 p refs

(NASA-TM-83833) Avail: NTIS HC A02/MF A01 CSCL 03B

An argument is made to support the proposal that Jupiter's red spot and the white and brown ovals are hurricanes or cyclones. Against the background of a convectively unstable troposphere, the general condition exists for the formation of hurricanes. The energy Jupiter emits must be transported upwards through the troposphere. If that transport is accelerated by the prevailing upward motions in the solar driven multicellular meridional circulation, eastward jets develop such as observed in the I region. But if that vertical transport is impeded by the prevailing downward motions in the meridional circulation, the atmosphere reacts and tends to maintain the process through the development of hurricanes. Dynamically induced by solar differential heating, an ordered latitudinal structure with alternating stability and instability is impressed on the troposphere to form alternating zonal strata where hurricanes are forbidden and permitted, respectively. B.W.

STRUCTURE AND ORIGIN OF COMETARY NUCLEI

Bertram Donn and Jurgen Rahe Sep. 1981 39 p refs Submitted for publication

(NASA-TM-83823) Avail: NTIS HC A03/MF A01 CSCL 03B

There is strong evidence that a comet nucleus consists of a single object whose basic structure is Whipple's icy conglomerate. A number of cometary phenomena indicate that the nucleus is a low density, fragile object with a large degree of radial uniformity in structure and composition. Details of the ice-dust pattern are more uncertain. A working model is proposed which is based on theories of accumulation of larger objects from grains. This nucleus is a distorted spherical aggregate of a hierarchy of ice-dust cometesimals. These cometesimals retain some separate identity which lead to comet fragmentation when larger components break off. The outer layers of new comets were modified by cosmic ray irradiation in the Oort Cloud. The evidence for meteorite-comet association is steill controversial. Current dynamical studies do not seem to require a cometary source of meteorites. A.R.H.

ORBIT IMPROVEMENT OF THE SATELLITES OF THE OUTER PLANETS Final Report, 1 Nov. 1973 - 30 Apr. 1981
Kaare Aksnes and Fred Franklin Nov 1981 7 p refs
(Grant NGR-09-015-213)
(NASA-CR-164987) Avail NTIS HC A02/MF A01 CSCL 03B

Data reduced from 127 plates showing Jupiter's and Saturn's satellites in the interval 1972 to 1974 are available on computer cards in the form of (O-C) residuals. Initial orbit calculations and several later orbit improvements for Jupiter XIII (Leda) culminated in an extended ephemeris for Leda to the year 2000. The possible existence of several small satellites just outside Saturns rings was predicted. De Sitter's incomplete theory for the motion of the Galilean satellites was reviewed and an outline for a revised, complete theory was developed. Observations of nearly 100 relative positions of the Galilean satellite with a mean accuracy of about 100 km (0 03 arc sec) were used to improve Sampson's theory for these satellites. Results were published on (1) a long ferm upper limit to Jupiter's orbital eccentricity, (2) deviation of an accurate modern value of the ellipiclity of Uranus from balloon-borne images and consequent evaluation of the planet's rotation rate; and (3) identification of features in Saturn's rings as produced by heretofore undetected tesseral harmonics of Saturn's gravitational field. X-RAY OBSERVATIONS OF STELLAR CORONAE Ph.D. Thesis
Kenneth Paul Topka 1980 265 p
Avail: Univ. Microfilms Order No 8120242

Data from the 8.5 magnitude stellar survey and the Gliese survey of all nearby stars listed in either of the two catalogs of the nearest stars that accidentally fell into any Einstein observation are presented. The results of the 8.5 and Gliese survey have been integrated with those of four other Einstein surveys. A correlation of X-ray luminosity with spectral type (soft X-ray H-R diagram) is presented. The observations are explained by the presence of hot coronae around stars of nearly every spectral type. However, the data is at variance in many respects to existing theoretical coronal models based on acoustic flux dissipation. The presence of stellar outer convection zones, surface magnetic fields, and rotation rates are discussed. Dissert. Abstr.

STUDY OF RADIATIVELY SUSTAINED CESIUM PLASMAS FOR SOLAR ENERGY CONVERSION Final Report, 1 Jul. 1978 - 30 Jun. 1980
A. J. Palmer and G. J. Dunning Jul. 1980 67 p refs
(Contract NAS2-10001)
(NASA-CR-166265) Avail: NTIS HC A04/MF A01 CSCL 10A

The results of a study aimed at developing a high temperature solar electric converter are reported. The converter concept is based on the use of an alkali plasma to serve as both an efficient high temperature collector of solar radiation as well as the working fluid for a high temperature working cycle. The working cycle is a simple magnetohydrodynamic (MHD) Rankine cycle employing a solid electrode Faraday MHD channel. Research milestones include the construction of a theoretical model for coupling sunlight in a cesium plasma and the experimental demonstration of cesium plasma heating with a solar simulator in excellent agreement with the theory. Analysis of a solar MHD working cycle in which excimer laser power rather than electric power is extracted is also presented. The analysis predicts a positive gain coefficient on the cesium-xenon excimer laser transition. R.J.F.

A STUDY OF GALACTIC LIGHT, EXTRAGALACTIC LIGHT, AND GALACTIC STRUCTURE USING PIONEER 10 OBSERVATIONS OF BACKGROUND STARLIGHT Ph.D. Thesis
Gary Neil Toller 1981 247 p
Avail: Univ. Microfilms Order No 8120063

The diffuse astronomical background sky brightness (background starlight) was determined over 95 percent of the sky using Pioneer 10 photometric measurements in sky regions where the zodiacal light is negligible. Brightness levels are presented at blue (3950-4850A) and red (5900-6800A) wavelengths. The B-R color index distribution is established over the celestial sphere. A computer model of our galaxy was constructed which computes the emitted and observed brightness from any volume element. The relation between DGL, direct starlight, and extinction along the line of sight is established. A small influence of galactic spiral structure on surface brightness levels exists at 1 = 2 deg (Sagittarius arm), 1 = 69 deg (Orion arm), and 1 = 288 deg (Carina arm). A correlation between brightness features and interstellar extinction is established. Analysis of the distribution of brightness peaks and dips and the location of the brightness symmetry plane establishes the Sun's elevation above the galactic plane as 12.2 + or - 2.1 pc. Dissert. Abstr.

ON THE NATURE OF THE COSMIC RAY POSITRON SPECTRUM
R. J. Protheroe Oct. 1981 25 p refs Submitted for publication
(NASA-TM-83834) Avail: NTIS HC A02/MF A01 CSCL 03B

A calculation was made of the flux of secondary positrons above 100 MeV expected for various propagation models. The models investigated were the leaky box or homogeneous model, a disk halo diffusion model, a dynamical halo model, and the closed galaxy model. In each case the parameters of these models were adjusted for agreement with the observed secondary or primary ratios and Be 10 abundance. The positron flux predicted for these models was compared with the available data. The possibility of a primary positron component was considered. R.J.F.

99 GENERAL

N82-13042# Office of Naval Research, Tokyo (Japan).
JAPANESE RESEARCH INSTITUTES FUNDED BY THE MINISTRY OF EDUCATION
Seikoh Sakiyama, comp. Jan. 1980 156 p
(ONRT-M2) Avail: NTIS HC A08/MF A01

The name, address, and telephone number of 317 research institutes are compiled. Exploraory notes are added where the specialty of the laboratory is not clear. The size of each laboratory, in terms of staff and budget is given. S.L.

N82-13043*# National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
RESEARCH AND TECHNOLOGY Annual Report
Nov. 1981 68 p

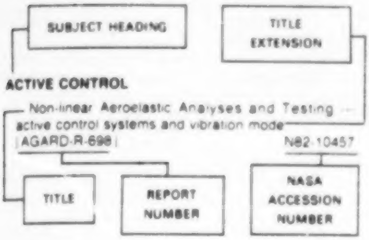
(NASA-TM-83221) Avail: NTIS HC A04/MF A01 CSCL 05B

Langley Research Center is engaged in the basic an applied research necessary for the advancement of aeronautics and space flight, generating advanced concepts for the accomplishment of related national goals, and provding research advice, technological support, and assistance to other NASA installations, other government agencies, and industry. Highlights of major accomplishments and applications are presented. S.L.

SUBJECT INDEX

SCIENTIFIC AND TECHNICAL AEROSPACE REPORTS VOLUME 20 NUMBER 3

Typical Subject Index Listing



The subject heading is the key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension has been added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The NASA accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus* (NASA SP-7050).

A

ABERRATION
Alignment of the Cassegrain and Coude optics of the 3.8m UK infrared telescope; assessment of the optical performance and results of aberration calculations
[UKIRT-10] N82-13024
ABLATION
The Rayleigh-Taylor and Kelvin-Helmholtz instabilities in targets accelerated by laser ablation
[AD-A104804] N82-12433
ABSORBERS (EQUIPMENT)
Basic investigations of an absorption heat pump, using heat of median temperature (heat transformer)
[BMFT-FB-T-81-013] N82-12405
ABSORBERS (MATERIALS)
Measurement of sound absorption of screens
[SP-RAPP-1979-31] N82-12895
ABSORPTION
Hydrogen and hydrocarbon absorption and desorption in sensors with transition metal gates on MOS capacitors N82-12331
ABSORPTION SPECTRA
Orientation measurements from polymer surfaces using Fourier transform infrared photoacoustic spectroscopy
[AD-A105398] N82-12232
Optical constants of boron carbide
[AD-A105451] N82-12975
ABSORPTIVITY
Photothermal measurement of optical surface absorption using strain transducers
[AD-A104745] N82-12420
A new power meter concept for high energy lasers
[AD-A104824] N82-12432
ACCELERATION (PHYSICS)
Susceptibility of materials processing experiments to low-level accelerations N82-12118
Spacecraft dynamic environments N82-12122
Contributions of orbital mechanics to conducting experiments in space N82-12124
Exceedance statistics of accelerations resulting from thruster firings on the Apollo-Soyuz mission N82-12127
ACCELEROMETERS
Seismic Engineering Program Report, September - December 1979
[USGS-CIRC-818-C] N82-12694
ACCESS CONTROL
Optimal synchronization for a distributed database N82-12791
UNIX NSW front end enhancements, volume 1
[AD-A105035] N82-12801
ACCIDENT PREVENTION
An analysis of civil aviation propeller-to-person accidents: 1965-1979
[AD-A105365] N82-12053
Overview of the biomedical and environmental programs at the Oak Ridge National Laboratory
[DE81-027864] N82-12765
Review of human and operational factors affecting the feasibility of the see-and-avoid concept
[DFVLR-MITT-81-13] N82-12780
Methodical study of the contribution of the human system to the insecurity of technological systems --- computerized accident analysis N82-12788
ACCLIMATIZATION
Higher plant acclimation to solar ultraviolet-B radiation N82-12737
ACCURACY
A second-order accurate procedure for solving the boundary layer equations based on the predictor-corrector form of the Crank-Nicolson scheme
[NAL-TR-655T] N82-12384
ACETYLENE
Acetylene terminated phenylene thermoset systems
[AD-A105394] N82-12176
ACID RAIN
Environmental pollutant studies, FY 1980
[DE81-028051] N82-12666
Preliminary study. Use of low-sulfur coal and coal cleaning in control of acid rain
[DE81-028930] N82-12675
ACOUSTIC ATTENUATION
Regional dependence of very low-frequency sound attenuation in the deep sound channel: Correlation with internal wave measurements
[AD-A105061] N82-12892
Measurement of sound absorption of screens
[SP-RAPP-1979-31] N82-12895
ACOUSTIC DUCTS
Numerical techniques in linear duct acoustics, 1980-81 update
[NASA-TM-82730] N82-12890
ACOUSTIC EMISSION
Acoustic emission of plastic flow in metals and alloys N82-12209
Acoustic emission from concrete specimens
[AD-A105416] N82-12478
ACOUSTIC LEVITATION
Analysis of SPAR 8 single-axis levitation experiment
[NASA-TM-82447] N82-12093
Drop dynamics N82-12113
Accustic system for material transport
[NASA-CASE-NPO-15453-1] N82-12889
ACOUSTIC MEASUREMENTS
Measurement of sound absorption of screens
[SP-RAPP-1979-31] N82-12895
ACOUSTIC PROPAGATION
Numerical techniques in linear duct acoustics, 1980-81 update
[NASA-TM-82730] N82-12890
Verification of an acoustic transmission matrix analysis of sound propagation in a variable area duct without flow
[NASA-TM-82741] N82-12891
ACOUSTICAL HOLOGRAPHY
Development and applications of computer-assisted acoustic holography N82-12418
ACOUSTICS
Verification of an acoustic transmission matrix analysis of sound propagation in a variable area duct without flow
[NASA-TM-82741] N82-12891
Research activities report of the Institute of Sound and Vibration Research N82-12894
ACOUSTO-OPTICS
A new power meter concept for high energy lasers
[AD-A104824] N82-12432
ACTIVATED CARBON
Significance of micropores in estimating adsorption properties of activated carbon
[VTT-39] N82-12147
Carbon-supported iron catalysts for CO hydrogenation N82-12154
ACTIVATION ANALYSIS
Environmental pollutant studies, FY 1980
[DE81-028051] N82-12666
ACTUATORS
Generalized study of a hydraulically actuated mechanism system N82-12375
ADAPTATION
Higher plant acclimation to solar ultraviolet-B radiation N82-12737
ADAPTIVE CONTROL
Microwave transversal equalizer. Open loop adaptive computer control techniques
[AD-A105005] N82-12356
Optimal adaptive stochastic control of linear dynamical systems with multiplicative and additive noise N82-12868
ADAPTIVE FILTERS
Fixed gain controller design for aircraft
[AD-A104877] N82-12081
ADAPTIVE OPTICS
Optical processing for adaptive phased array radar
[AD-A105124] N82-12305
ADDITIVES
Chemistry of combustion of fuel-water mixtures
[AD-A105401] N82-12178
ADDRESSING
Multicast and synchronization in distributed systems --- algorithms
[CTH-81.2-R] N82-12835
ADHESION
Silver films for solid state bonding
[DE82-000414] N82-12223
Bibliographical study of nondestructive testing applicable to bonding
[CETIM-1.3N.20.2-PT-1] N82-12461
ADHESIVE BONDING
Bibliographical study of nondestructive testing applicable to bonding
[CETIM-1.3N.20.2-PT-1] N82-12461
ADIABATIC CONDITIONS
Topics in the evolution of cosmological perturbations N82-13029
ADSORPTIVITY
Significance of micropores in estimating adsorption properties of activated carbon
[VTT-39] N82-12147

ADVECTION
Advective effects in the numerical simulation of long period, large amplitude wave behavior
[AD-A105231] N82-12391

AERIAL PHOTOGRAPHY
Close-range cine-photogrammetry: A generalized technique for quantifying gross human motion
N82-12781

AERIAL RECONNAISSANCE
Hydrogeochemical and stream sediment reconnaissance basic data for Harrison Bay Quadrangle, Alaska
[DE81-028352] N82-12530

AERODYNAMIC BALANCE
Evaluation and wind tunnel tests of the 4,000 lb (normal-force) pitch/yaw and roll dynamic stability balance systems for measuring direct, cross, and cross-coupling derivatives
[AD-A105122] N82-12047

AERODYNAMIC CHARACTERISTICS
Aerodynamic measurements concerned with a turret model
[NASA-CR-166264] N82-12034
A vortex-filament and core model for wings with edge vortex separation
[NASA-CR-164960] N82-12039
Aeroelasticity matters: Some reflections on two decades of testing in the NASA Langley transonic dynamics tunnel
[NASA-TM-83210] N82-12041
Automatic plotting routines for estimating static aerodynamic properties of long rod finned projectiles for 2,M,5
[AD-A104800] N82-12046
Effects of aerodynamic coupling on the dynamics of roll aircraft N82-12070

AERODYNAMIC COEFFICIENTS
A vortex-filament and core model for wings with edge vortex separation
[NASA-CR-164960] N82-12039

AERODYNAMIC CONFIGURATIONS
Subcritical and supercritical airfoils for given pressure distribution N82-12031
Transonic airfoil design of full potential flow. 1: Numerical procedure and its computational examples
[NAL-TR-672] N82-12036
Computational fluid mechanics and its impact on the aircraft aerodynamicist
[DGLR-PAPER-81-3] N82-12409

AERODYNAMIC FORCES
Low-speed measurements of the static pressure distribution and overall forces on a cambered and a symmetric mild gothic wing of aspect ratio 1.4
[RAE-TR-80066] N82-12027
Wind-tunnel investigation of the side-force of rectangular winglets on the tip of a rectangular wing
[NAL-TR-669] N82-12037
An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on model scale effects
[AD-A104905] N82-12392

AERODYNAMIC LOADS
Performance and loads data from a wind tunnel test of a full-scale, coaxial, hingeless rotor helicopter
[NASA-TM-81329] N82-12040
A source-doublet approach to modeling triple ejector rack store configurations and force calculations
[AD-A105427] N82-12045
A tile-gap flow model for use in aerodynamic loads assessment of space shuttle thermal protection system: Parallel gap faces
[NASA-TM-83151] N82-12387

AERODYNAMIC STABILITY
On Vortex breakdown and instability
[AD-A104880] N82-12048

AERODYNAMICS
Effect of a part span variable inlet guide vane on TF34 fan performance
[NASA-CR-165458] N82-12075
A look inside the Langley 16-foot transonic tunnel: User's guide
[NASA-TM-83186] N82-12085
Computational fluid mechanics and its impact on the aircraft aerodynamicist
[DGLR-PAPER-81-3] N82-12409
Security assessment of power systems including energy storage and with the integration of wind energy
[DE81-030166] N82-12590
Research and Technology
[NASA-TM-83221] N82-13043

AEROELASTICITY
Aeroelasticity matters: Some reflections on two decades of testing in the NASA Langley transonic dynamics tunnel
[NASA-TM-83210] N82-12041

AERONAUTICAL ENGINEERING
Index of National Aviation Facilities Experimental Center technical reports 1972 - 1977
[AD-A104759] N82-12056
Research and Technology
[NASA-TM-83221] N82-13043

AERONOMY
Special observations by the Hohenpeissenberg Meteorological Observatory. Number 42: Results of aerological and surface ozone measurements during the first semester of 1980
[SONDERBEOB-42] N82-12714

AEROSOLS
Inductively coupled plasma as an ion source for the determination of trace elements in solutions by mass spectrometry
[DE81-030744] N82-12192
Detection of laser radiation by means of forward scattering in the atmosphere
[PHL-1979-51] N82-12327
Environmenal pollutant studies, FY 1980
[DE81-028051] N82-12666
SAGE measurements of the stratospheric aerosol dispersion and loading from the Soufriere Volcano
[NASA-TP-1922] N82-12687
Reduction of photosynthetically active radiation under extreme stratospheric aerosol loads
[DE81-030606] N82-12705

AEROSPACE INDUSTRY
Overall economic impact of an operational Meteosat system
[ESA-CR(P)-1457] N82-13010

AEROSPACE MEDICINE
Aerospace medicine and biology. A continuing bibliography with indexes, supplement 224
[NASA-SP-7011(224)] N82-12744
Biomedical research
[NASA-CR-3487] N82-12751
Quantitation of tissue loss during prolonged space flight
[NASA-CR-167460] N82-12752
Skylab water balance analysis
[NASA-CR-167461] N82-12753

AFRICA
Report on Skylab 4 African drought and arid land experiment N82-12501

AFTERBODIES
An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on model scale effects
[AD-A104905] N82-12392

AGREEMENTS
Patent licensing contracts in the electronic industry — Denmark
[ECR-104] N82-13011

AGRICULTURE
Cultural features imaged and observed from Skylab 4 N82-12499
Peat deposits of Dismal Swamp pocosins: Camden, Currituck, Gates, Pasquotank, and Perquimans Counties, North Carolina
[DE81-029642] N82-12524
Models for forecasting energy use in the US farm sector
[DE81-904220] N82-12580
Technology assessment of solar energy systems: Potential soil erosion effects of harvesting crop residues for energy production
[DE82-000149] N82-12606

AIR
Thresholds of hearing by air conduction and by bone conduction under different masking conditions
[NPL-AC-100] N82-12768
Dynamics of an intense relativistic electron beam injected into full density air
[AD-A104743] N82-12901

AIR CONDITIONING
Practical demonstration of heat pumps for utilization of animal-generated heat
[BMFT-FB-T-80-100] N82-12403

AIR CONDITIONING EQUIPMENT
Electric and hybrid vehicle environmental control subsystem study
[NASA-CR-164996] N82-12658

AIR CUSHION LANDING SYSTEMS
Experimental and analytical studies of advanced air cushion landing systems
[NASA-CR-3476] N82-12065

AIR FLOW
A vapour cycle cabin cooling system for the Sea King MK.50 helicopter
[AD-A105211] N82-12069

AIR POLLUTION
Quantitative analysis of atmospheric pollution phenomena N82-12505
Benefit-cost analysis with uncertain information: An application in air pollution control N82-12652
User manual for SILVA: A computer code for estimating effects of pollution on the growth and succession of Western coniferous forests
[DE82-000134] N82-12664
Lagrangian measurements of sulfur dioxide to sulfate conversion rates
[DE82-000246] N82-12666
Impact of energy-related pollutants on chromosome structure
[DE82-000153] N82-12670
Preliminary study: Use of low-sulfur coal and coal cleaning in control of acid rain
[DE81-028930] N82-12675
Three dimensional simulation model MODIS for the propagation of air pollutants
[GKSS-80-E-56] N82-12677

AIR QUALITY
Energy efficiency buildings program
[DE81-026050] N82-12276
Midway house-tightening project: A study of indoor air quality --- concentrations of radon formaldehyde, and nitrogen dioxide
[DE81-030686] N82-12277
Technology assessment of solar energy systems: Residential use of fuelwood in the Pacific Northwest
[DE82-000046] N82-12603
A computer simulation modeling study to predict air quality impacts from a 500 MW coal-fired power plant N82-12650

AIR SAMPLING
Cryogenic deposition, desorption, and reaction studies of stratospherically relevant species
N82-12161
Development of an air sampling and analytical method for 1,6-hexamethylene diisocyanate
[AD-A105002] N82-12659

AIR TRAFFIC CONTROL
Orienting description of air traffic control in the Netherlands
[VTH-LR-285] N82-12063
Moving target Detector/Airport Surveillance radar (ASR-7) field evaluation
[AD-A105196] N82-12303

AIR TRANSPORTATION
Transportation systems evaluation methodology development and applications, phase 3
[NASA-CR-164999] N82-12051

AIR WATER INTERACTIONS
Meteorological lab applications of Skylab handheld-camera photographs N82-12506
Mesoscale cloud features observed from Skylab
N82-12509
Evaluation of a method for short-range forecasting of evaporation duct heights
[AD-A104892] N82-12724

AIRCRAFT ACCIDENT INVESTIGATION
Investigation of severe lightning strike incidents to two USAF F-106A aircraft
[NASA-CR-165794] N82-12052
Summary of Federal Aviation Administration responses to National Transportation Safety Board safety recommendations
[AD-A104922] N82-12055

AIRCRAFT ACCIDENTS
An investigation into pilot and system response to critical in-flight events. Volume 1: Executive summary
[NASA-CR-164993] N82-12782
An investigation into pilot and system response to critical in-flight events. Volume 2: Appendix
[NASA-CR-164994] N82-12783

AIRCRAFT COMPARTMENTS
A vapour cycle cabin cooling system for the Sea King MK.50 helicopter
[AD-A105211] N82-12069
AIRCRAFT CONTROL
Reliability analysis of the F-8 digital fly-by-wire system
[NASA-CR-163110] N82-12079
Fixed gain controller design for aircraft
[AD-A104877] N82-12081
AIRCRAFT DESIGN
Transonic airfoil design of full potential flow. 1: Numerical procedure and its computational examples
[NAL-TR-672] N82-12038
A symposium on transonic flow research
[AD-A104871] N82-12044
Index of National Aviation Facilities Experimental Center technical reports 1972 - 1977
[AD-A104759] N82-12056
Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164983] N82-12080
Computational fluid mechanics and its impact on the aircraft aerodynamicist
[DGLR-PAPER-81-3] N82-12409
Research and Technology
[NASA-TM-83221] N82-13043
AIRCRAFT DETECTION
Prompt detection of aircraft maneuvers by use of range rate radar data
[AD-A105063] N82-12302
AIRCRAFT ENGINES
The use of metal finishing in aircraft fuel systums
N82-12077
AIRCRAFT EQUIPMENT
Portable air driven variable speed fiber optic cable termination polisher
[AD-A104797] N82-12448
AIRCRAFT FUEL SYSTEMS
The use of metal finishing in aircraft fuel systems
N82-12077
AIRCRAFT HAZARDS
Investigation of severe lightning strike incidents to two USAF F-106A aircraft
[NASA-CR-165794] N82-12052
AIRCRAFT HYDRAULIC SYSTEMS
Mathematical models and digital simulation of hydraulic constant speed drive units for aircraft electrical supply systems, volume 1
[TT-8102-VOL-1] N82-12071
AIRCRAFT INDUSTRY
Advantages and limitations of various materials used in the construction of modules --- aircraft construction
[SNIAS-812-551-103] N82-12072
AIRCRAFT INSTRUMENTS
Index of National Aviation Facilities Experimental Center technical reports 1972 - 1977
[AD-A104759] N82-12056
Electronic Master Monitor and Advisory Display System (EMMADS)
[AD-A105082] N82-12067
AIRCRAFT LANDING
The use of groundspeed, in a wind shear and the flight evaluation of a radar-altimeter-based system for the measurement of groundspeed
[AD-A104758] N82-12060
The effect of visual information on manual approach and landing
[NLR-MP-80019-U] N82-12064
AIRCRAFT MANEUVERS
Prompt detection of aircraft maneuvers by use of range rate radar data
[AD-A105063] N82-12302
AIRCRAFT NOISE
Effects of activity interference on annoyance due to aircraft noise
[NASA-TP-1938] N82-12654
Research and Technology
[NASA-TM-83221] N82-13043
AIRCRAFT PERFORMANCE
Experimental and analytical studies of advanced air cushion landing systems
[NASA-CR-3476] N82-12065
AIRCRAFT PILOTS
An investigation into pilot and system response to critical in-flight events. Volume 1: Executive summary
[NASA-CR-164993] N82-12782
An investigation into pilot and system response to critical in-flight events. Volume 2: Appendix
[NASA-CR-164994] N82-12783
AIRCRAFT SAFETY
An analysis of civil aviation propeller-to-person accidents: 1965-1979
[AD-A105365] N82-12053
Computer Air Carrier Symposium
[AD-A104894] N82-12054
Summary of Federal Aviation Administration responses to National Transportation Safety Board safety recommendations
[AD-A104[illegible]22] N82-12055
An investigation into pilot and system response to critical in-flight events. Volume 1: Executive summary
[NASA-CR-164993] N82-12782
AIRCRAFT STRUCTURES
Flight trail of the Aircraft Fatigue Data Analysis System (AFDAS) Mk 2 prototype
[AD-A105270] N82-12066
AIRCRAFT TIRES
Deep anistropic shell program for tire analysis
[NASA-CR-3483] N82-12845
AIRFOIL PROFILES
Subcritical and supercritical airfoils for given pressure distribution N82-12031
German-Argentine experiment: Vertical-rotor wind engine N82-12648
AIRFOILS
The numerical solution of incompressible turbulent flow over airfoils N82-12030
A pulse-forming network for particle path visualization --- at Ames Aeromechanics Water Tunnel Facility
[NASA-TM-81311] N82-12036
Transonic airfoil design of full potential flow. 1: Numerical procedure and its computational examples
[NAL-TR-672] N82-12038
Advanced cooling full-scale engine demonstration
[DE81-904253] N82-12452
AIRFRAME MATERIALS
Advantages and limitations of various materials used in the construction of modules --- aircraft construction
[SNIAS-812-551-103] N82-12072
AIRGLOW
Infrared emission spectroscopy of low pressure gaseous discharges
[AD-A104123] N82-12180
AIRLINE OPERATIONS
Analysis of integrated fuel-efficient, low-noise procedures in terminal-area operations
[DE81-029833] N82-13014
AIRPORT PLANNING
Analysis of integrated fuel-efficient, low-noise procedures in terminal-area operations
[DE81-029833] N82-13014
AIRPORT TOWERS
Conspicuity of observation posts at the air weapon firing ranges on the Vliehors and the Noordvaarder
[IZF-1979-33-E] N82-12774
AIRSPEED
AFFTC standard airspeed calibration procedures
[AD-A104830] N82-12074
ALASKA
Hydrogeochemical and stream sediment reconnaissance basic data for Ruby Quadrangle, Alaska
[DE81-029982] N82-12512
Hydrogeochemical and stream sediment reconnaissance basic data for Wainwright Quadrangle, Alaska
[DE81-028670] N82-12528
Hydrogeochemical and stream sediment reconnaissance basic data for Point Lay Quadrangle, Alaska
[DE81-028669] N82-12529
Hydrogeochemical and stream sediment reconnaissance basic data for Harrison Bay Quadrangle, Alaska
[DE81-028352] N82-12530
Hydrogeochemical and stream sediment reconnaissance basic data for Teshekpuk Quadrangle, Alaska
[DE81-027406] N82-12531
ALBUMINS
Separation via multi-column pH parametric pumping N82-12158
Gastrointestinal allergy in the experimental animal. The use of radioiodinated serum albumin in the assessment of new drugs
[IAEA-R-2067-F] N82-12741
ALCOHOLS
Synthesis gas conversion to liquid fuels using promoted fused iron catalysts
[DE81-030657] N82-12259
ALGEBRA
Solution methods on algebra problems with simultaneous equations
[AD-A105178] N82-12852
On probability proportional to size sampling designs: Their construction, algebraic properties, and applications N82-12871
ALGOL
ALGOL 68 plus: A superlanguage of ALGOL 68 for processing the standard-prelude
[MC-IW-168/81] N82-12832
ALGORITHMS
Efficient structure, and algorithms for digital signal processing N82-12296
Comparative study of nonlinear time warping techniques in isolated word speech recognition systems
[AD-A104865] N82-12306
Tracking procedures for FUCAS --- phased array radar
[PHL-1980-45] N82-12329
Solution of nonlinear structural problems using array processors
[AD-A104867] N82-12800
Restructuring COBOL programs to improve readability N82-12811
Using program transformations to derive line-drawing algorithms
[AD-A104873] N82-12817
Minimizing computational cost for dynamic programming algorithms
[AD-A104792] N82-12818
Multicast and synchronization in distributed systems --- algorithms
[CTH-81.2-R] N82-12835
On the computation of optimal designs for certain time series models with applications to optimal quantile selection for location or scale parameter estimation
[AD-A104935] N82-12875
On some numerical properties of ARMA parameter estimation procedures
[AD-A104938] N82-12879
Large-scale systems optimization using nonlinear integer goal programming methods N82-12882
ALIGNMENT
New Photolithographic methods: Projection alignment for the metallization of highly integrated circuits --- alternative metallization method
[BMFT-FB-T-81-018] N82-12427
New photolithographic method for small dimension. Direct step and repeat technique (silicon repeater)
[BMFT-FB-T-81-019] N82-12428
An active alignment scheme for the MPTS array
N82-12541
An interferometer-based phase control system
N82-12547
Alignment of the Cassegrain and Coude optics of the 3.8m UK infrared telescope; assessment of the optical performance and results of aberration calculations
[UKIRT-10] N82-13024
ALIPHATIC COMPOUNDS
Design, construction, and operation of a full scale experimental anaerobic fermentation facility
[DE81-029028] N82-12605
ALKALI HALIDES
Fire extinguishant materials
[NASA-CASE-ARC-11252-1] N82-12168
Latent heat storage devices. Part 1: Characteristics and applicability of latent heat storage devices
[BMVG-FBWT-79-12-PT-1] N82-12638
ALKALI METALS
Fire extinguishant materials
[NASA-CASE-ARC-11252-1] N82-12168
Determination of a potential model for the calculation of interatomic potentials in the case of alkali-rare gas interaction
[MPIS-16/1980] N82-12912
ALKYL COMPOUNDS
Reactions of tributylstannyl anioniods with alkyl bromides
[AD-A105433] N82-12136

ALKYLATION

Reactions of tributylstannyl arsonode with alkyl bromides [AD-A105433] N82-12136

ALLOCATIONS

Assignment techniques for heavily loaded networks [A-79-VK-45-07] N82-12968

ALLOYS

Acoustic emission of plastic flow in metals and alloys N82-12209

Steam turbine blades: Considerations in design and a survey of blade failures [DE81-904249] N82-12450

ALTIMETERS

Ionospheric propagation correction modeling for satellite altimeters [NASA-CR-156881] N82-12447

Boundary detection criteria for satellite altimeters [NASA-CR-156880] N82-12734

ALTITUDE

Spherical models: Basic states and stability N82-12720

ALUMINATES

Fracture of magnesium aluminate spinel N82-12213

ALUMINUM

Study of Al/Si interface by photoemission, Auger electron spectroscopies [DESY-SR-80/06] N82-12979

ALUMINUM ALLOYS

Survey of nickel-aluminium-bronze casting alloys on marine applications [AD-A105263] N82-12218

A fundamental study of fatigue in powder metallurgy aluminum alloys [AD-A105080] N82-12219

ALUMINUM COATINGS

The removal, mechanical handling and installation procedures for re-aluminising the UKIRT 3.8m primary mirror --- United Kingdom Infrared Telescope (UKIRT) [UKIRT-11] N82-13025

ALUMINUM COMPOUNDS

Fire extinguishant materials [NASA-CASE-ARC-11252-1] N82-12168

Deep levels in Al sub x Ga sub 1 xAs:Fe single crystals [AD-A105233] N82-12970

ALUMINUM OXIDES

Behavior and morphology of palladium on alumina model catalysis in hydrogen and oxygen N82-12163

Coprecipitated nickel-alumina methanation catalysts N82-12169

Diffusion of gases in capillaries [DE82-000267] N82-12908

ALVEOLAR AIR

Oxygen toxicity and lung collagenous protein [AD-A104702] N82-12756

AMINES

Solvent extraction studies using high-molecular-weight amines [DE81-030061] N82-12191

AMINO ACIDS

Neurotransmitter mechanisms in the nucleus accumbens septi and related regions in the rat brain [NDRE/PUBL-81/1001] N82-12738

AMMONIA

Fuel nitrogen conversion during fuel rich combustion of pulverized coal and char N82-12156

Production of ammonia in a packed-bed, anaerobic upflow (ANFLOW) bioreactor [DE81-030699] N82-12619

AMMONIUM COMPOUNDS

Solvent extraction studies using high-molecular-weight amines [DE81-030061] N82-12191

AMMONIUM NITRATES

A search for new fuel components in explosive mixtures with ammonium nitrate [AD-A104881] N82-12245

AMPLIFIERS

Analytic investigation of efficiency and performance limits in klystron amplifiers using multidimensional computer programs; multi-stage depressed collectors; and thermionic cathode life studies N82-12553

Session on solid state: Introduction N82-12565

Modified reference SPS with solid state transmitting antenna N82-12566

SPS solid state antenna power combiner N82-12567

AMPLITUDES

Advective effects in the numerical simulation of long period, large amplitude wave behavior [AD-A105231] N82-12391

ANAEROBES

State of the art of methane gas enhancement in landfills [DE82-000155] N82-12253

Design, construction, and operation of a full scale experimental anaerobic fermentation facility [DE81-029028] N82-12605

Production of ammonia in a packed-bed, anaerobic upflow (ANFLOW) bioreactor [DE81-030699] N82-12619

Waste-to-energy Systems Institutional Barriers Assessment Workshop [DE82-000098] N82-12621

ANALOG DATA

Application of Pulse Code Modulation (PCM) technology to aircraft dynamics data acquisition [AD-A104775] N82-12088

ANALOG SIMULATION

Laminar-flow-cyclone development program [DE81-001297] N82-12399

ANALYSIS (MATHEMATICS)

Electromagnetic diffraction by a narrow slit in an impedance sheet-E-polarization [AD-A105029] N82-12144

ANALYSIS OF VARIANCE

Variances for adaptive trimmed means [AD-A104913] N82-12876

ANALYZERS

Measurement procedure to determine organic compounds in water (combustion method) [BMFT-FB-T-81-014] N82-12206

ANGLES (GEOMETRY)

Nonlinear interaction of sound waves in water: Experiments with parametric arrays [PHL-1979-44] N82-12897

ANGULAR CORRELATION

TDPAC study of the In2Se3 crystal structure [AD-A104729] N82-12974

ANGULAR DISTRIBUTION

Inclusive proton spectra and total reaction cross sections for proton-nucleus scattering at 800 MeV [DE81-030505] N82-12906

ANGULAR MOMENTUM

The rigid shell component for superrotation in planetary atmospheres: Angular momentum budget, mechanical analog and simulation of the spin up process [NASA-TM-83831] N82-13033

ANIMALS

Hydrocarbon composition of sediments, water, and fauna in selected areas of the Gulf of Mexico and Southern California marine environment N82-12732

ANISOTROPIC MEDIA

Radiative heat transfer in emitting, absorbing and anisotropically scattering particulate clouds N82-12372

Analytical solution of anisotropic heat conduction in simple and irregular regions N82-12379

Theory of thermoelasticity [NASA-TM-75510] N82-12473

Anisotropic and electro-optical effects in liquid crystals [AD-A105189] N82-12936

ANISOTROPIC PLATES

Laminated anisotropic reinforced plastic plates and shells [NASA-TM-76585] N82-12474

ANISOTROPIC SHELLS

Laminated anisotropic reinforced plastic plates and shells [NASA-TM-76585] N82-12474

Deep anistropic shell program for tire analysis [NASA-CR-3483] N82-12845

ANISOTROPY

Anisotropic and electro-optical effects in liquid crystals [AD-A105189] N82-12935

ANNUAL VARIATIONS

Seasonal performance factors for active solar systems and heat-pump systems [DE81-026569] N82-12625

ANNULAR FLOW

Calculation and measurement of the turbulence of an incompressible flow in a labyrinth seal between a rotating shaft and a cylinder at rest [EPFL-ITA-8] N82-12382

Calculation of annular and twin parallel jets using various discretization schemes and turbulence model variants [KU-SFB-80/T/159] N82-12383

ANTENNA ARRAYS

Radar imaging from a distorted array [AD-A104803] N82-12308

Antenna [AD-A106521] N82-12312

Multiple-beam, high-power, precision pointing antenna system [NASA-CASE-NPO-15406-1] N82-12345

Workshop on Microwave Power Transmission and Reception. Workshop paper summaries [NASA-TM-84064] N82-12536

An active alignment scheme for the MPTS array N82-12541

Design and breadboard evaluation of the SPS reference phase control system concept N82-12545

SPS antenna element evaluation N82-12555

The Resonant Cavity Radiator (RCR) N82-12556

Evaluation of thick wall wave guide element N82-12557

Method for precision forming of low-cost, thin-walled slotted waveguide arrays for the SPS N82-12558

Rectenna array measurement results N82-12564

ANTENNA COMPONENTS

Formulation of a dynamic analysis method for a generic family of hoop-mast antenna systems [NASA-CR-164981] N82-12300

ANTENNA DESIGN

Antenna [AD-A106521] N82-12312

Reduction of multipath fading in radio relay links based on the principle of optimum beam scan [REPT-455-TBR-71] N82-12320

The 94GHz propagation facility at the Ypenburg airfield and the first experimental results --- attenuation [PHL-1979-34] N82-12325

Test progress on the electrostatic membrane reflector [NASA-CR-165792] N82-12472

SPS antenna element evaluation N82-12555

The Resonant Cavity Radiator (RCR) N82-12556

Evaluation of thick wall wave guide element N82-12557

Rectenna system design N82-12561

Rectenna session: Micro aspects N82-12562

A theoretical study of microwave beam absorption by a rectenna N82-12563

Modified reference SPS with solid state transmitting antenna N82-12566

SPS solid state antenna power combiner N82-12567

Solid-state retrodirective phased array concepts for microwave power transmission from Solar Power Satellite N82-12568

ANTENNA RADIATION PATTERNS

Antenna [AD-A106521] N82-12312

The method of Frieman and Kroll for the calculation of electromagnetic fields and its application to data inversion [AD-A104809] N82-12315

Multiple-beam, high-power, precision pointing antenna system [NASA-CASE-NPO-15406-1] N82-12345

SPS large array simulation N82-12540

ANTENNAS

Antenna [AD-A106521] N82-12312

ANTHRACENE

Synchronous fluorescence/matrix isolation method for trace organic analysis [DE81-030958] N82-12193

ANTIMATTER

Collective effects in diffuse ambiplasma N82-12983

APERTURES

The uniqueness of phase retrieval from intensity measurements [AD-A105168] N82-12934

APPALACHIAN MOUNTAINS (NORTH AMERICA)

A land use decision methodology for mine lands in Appalachia
[PB81-220113] N82-12678

APPLICATIONS PROGRAMS (COMPUTERS)

Description and use of the Monte Carlo code LILITA
[DE81-030704] N82-12904

Neutron cross section measurements using the ORELA: The stable tellurium isotopes (n, beta), U(n,n')-238, Th(n,n')-232, Os(n,n')-187, Os(n,nn' beta)-186,187,188, and Ti(n,n beta)-205
[DE81-030164] N82-12907

APPROACH

The use of groundspeed, in a wind shear and the flight evaluation of a radar-altimeter-based system for the measurement of groundspeed
[AD-A104758] N82-12060

The effect of visual information on manual approach and landing
[NLR-MP-80019-U] N82-12084

APPROXIMATION

Quasi-stationary approximation for the Stefan problem with a convective boundary condition
[DE81-030372] N82-12395

Autoregressive spectral estimation, log spectral smoothing and entropy
[AD-A104940] N82-12949

Development and analysis of a modified screening procedure to increase acceptable product
[AD-A104936] N82-12874

AQUEOUS SOLUTIONS

Correlation and prediction of vapor-liquid equilibrium in electrolytic solutions N82-12157

Electrophotolysis oxidation system for measurement of organic concentration in water
[NASA-CASE-MSC-16497-1] N82-12166

Inductively coupled plasma as an ion source for the determination of trace elements in solutions by mass spectrometry
[DE81-030744] N82-12192

Liquid immersion apparatus for minute articles
[NASA-CASE-MFS-25363-1] N82-12441

Technical databook for geothermal energy utilization
[DE81-029888] N82-12614

Kinetics of wet oxidation of biological sludges from coal-conversion wastewater treatment
[DE82-000525] N82-12674

AQUIFERS

Study of ATES thermal behavior using a steady flow model
[DE81-030883] N82-12396

Bibliography of the seasonal thermal energy storage library
[DE81-030470] N82-12586

ARCHITECTURE

Solar explosion
[DE81-026086] N82-12628

ARCHITECTURE (COMPUTERS)

Recognize regular languages with programmable building blocks
[AD-A104874] N82-12816

ARGENTINA

German-Argentine experiment: Vertical-rotor wind engine N82-12648

ARGON LASERS

Intense proton beam excitation of a high pressure argon-nitrogen laser N82-12430

ARIANE LAUNCH VEHICLE

Energy dissipation in Exosat tanks: Test results
[CNES-NT-99] N82-12103

ARID LANDS

Report on Skylab 4 African drought and arid land experiment N82-12501

ARIZONA

Guidebook for solar process-heat applications
[DE81-027977] N82-12598

ARTERIES

Three-dimensional stress distribution in arteries: Radial compression experiments of arterial wall; stress concentration in lung near a cylindrical cavity; finite element analysis of pleural surface pressure distribution in dog's lung during electrophrenic stimulation N82-12750

ARTIFICIAL INTELLIGENCE

Thinking about lots of things at once without getting confused: Parallelism in Act 1
[AD-A104965] N82-12799

A preview of act 1
[AD-A104964] N82-12824

Knowledge-based expert systems: A brief bibliography
[AD-A104793] N82-12840

Semantics of inheritance and attributions in the description system Omega
[AD-A104776] N82-12841

ASHES

New building materials. A contribution to environmental protection. Subproject: Fly ash cement
[BMFT-FB-T-80-176] N82-12285

Mount St. Helens volcanic-ash fall in the Bull Run wateshed, Oregon, March - June 1980
[USGS-CIRC-850-A] N82-12688

ASTEROIDS

Radar investigation of asteroids
[NASA-CR-164997] N82-13036

ASTRONAUTICS

Hardware survey for the avionics test bed
[NASA-CR-161072] N82-12796

ASTRONOMICAL MODELS

Structure and origin of cometary nuclei
[NASA-TM-83823] N82-13035

ASYMMETRY

Extracted-pole filter multiplexion and asymmetric double array network synthesis
[ESA-CR(P)-1453] N82-12371

ATLANTIC OCEAN

An assessment of the potential contributions to oceanography from Skylab visual observations and handheld-camera photographs N82-12503

ATLAS CENTAUR LAUNCH VEHICLE

Third Intelsat 5 satellite scheduled for launch
[NASA-NEWS-RELEASE-81-185] N82-12097

ATMOSPHERIC ATTENUATION

Handbook for the estimation of microwave propagation effects: Link calculations for earth-space paths (path loss and noise estimation)
[NASA-CR-165002] N82-12301

The 94GHz propagation facility at the Ypenburg airfield and the first experimental results --- attenuation
[PHL-1979-34] N82-12325

ATMOSPHERIC CHEMISTRY

Cryogenic deposition, desorption, and reaction studies of stratospherically relevant species N82-12161

Infrared emission spectroscopy of low pressure gaseous discharges
[AD-A104123] N82-12180

Lagrangian measurements of sulfur dioxide to sulfate conversion rates
[DE82-000246] N82-12665

Overview of the biomedical and environmental programs at the Oak Ridge National Laboratory
[DE81-027864] N82-12765

ATMOSPHERIC CIRCULATION

A two-layer ground hydrology model interactive with an atmospheric circulation model N82-12486

Radiation budget measurement/model interface research
[NASA-CR-165000] N82-12699

Morphology of stratospheric planetary waves
[AD-A105006] N82-12704

The Numerical Studies Program for the Atmospheric General Circulation Experiment (AGCE) for Spacelab Flights
[NASA-CP-2200] N82-12715

Overview N82-12716

The AGCE apparatus N82-12717

Hydrostatic calculations of axisymmetric flow and its stability for the AGCE model N82-12718

Cylindrical annulus models N82-12719

The three dimensional spherical model for the AGCE N82-12721

Preliminary regime diagram on a sphere with a simplified general circulation model N82-12723

On the global circulation and the hurricane system of the Jovian atmosphere
[NASA-TM-83833] N82-13034

ATMOSPHERIC CLOUD PHYSICS LAB (SPACELAB)

Interactions between spacecraft motions and the atmospheric cloud physics laboratory experiments N82-12114

ATMOSPHERIC COMPOSITION

Special observations by the Hohenpeissenberg Meteorological Observatory. Number 42: Results of aerological and surface ozone measurements during the first semester of 1980
[SONDERBEOB-42] N82-12714

ATMOSPHERIC CONDUCTIVITY

Toward an understanding of the turbulent electrode effect over land
[AD-A104902] N82-12700

ATMOSPHERIC DENSITY

Orbital environment dynamics N82-12123

ATMOSPHERIC EFFECTS

Environmenal pollutant studies, FY 1980
[DE81-028051] N82-12666

ATMOSPHERIC ENTRY

An experimental study of massive blowing from a nosetip during Jovian entry
[NASA-CR-165756] N82-12386

ATMOSPHERIC MODELS

Advanced Shuttle Simulation Turbulence Tapes (SSTT) users guide
[NASA-CR-161890] N82-12106

Ionospheric propagation correction modeling for satellite altimeters
[NASA-CR-156881] N82-12447

A two-layer ground hydrology model interactive with an atmospheric circulation model N82-12486

Morphology of stratospheric planetary waves
[AD-A105006] N82-12704

ATMOSPHERIC PHYSICS

USSR report: Earth sciences, no. 17
[JPRS-79342] N82-12489

The Numerical Studies Program for the Atmospheric General Circulation Experiment (AGCE) for Spacelab Flights
[NASA-CP-2200] N82-12715

Overview N82-12716

The AGCE apparatus N82-12717

Hydrostatic calculations of axisymmetric flow and its stability for the AGCE model N82-12718

Cylindrical annulus models N82-12719

Spherical models: Basic states and stability N82-12720

Preliminary regime diagram on a sphere with a simplified general circulation model N82-12723

ATMOSPHERIC SCATTERING

Detection of laser radiation by means of forward scattering in the atmosphere
[PHL-1979-51] N82-12327

ATMOSPHERIC SOUNDING

Microwave limb sounder --- measuring trace gases in the upper atmosphere
[NASA-CASE-NPO-14544-1] N82-12665

ATMOSPHERIC TEMPERATURE

Adverse weather and night capability: A call for action. Volume 2: Appendix, data base for selected important military locations
[AD-A104991] N82-12726

ATMOSPHERIC TURBULENCE

Advanced Shuttle Simulation Turbulence Tapes (SSTT) users guide
[NASA-CR-161890] N82-12106

ATOMIC COLLISIONS

Interaction potentials between rare gas atoms and hologen atoms
[AD-A104836] N82-12899

Experimental demonstration of Feshbach resonances in atom-molecule scattering, with the help of measurements on the H2(pH2)-Kr and HD-Xe systems
[MPIS-14/1980] N82-12913

ATOMIC ENERGY LEVELS

Oxygen induced triplet state transitions of benzene in cryogenic solutions
[AD-A105432] N82-12900

Determination of a potential model for the calculation of interatomic potentials in the case of alkali-rare gas interaction
[MPIS-16/1980] N82-12912

ATOMIZING

Combustion and emission characteristics of a model gas turbine combustor burning lean heterogeneous mixtures --- effect of degree of atomizing
[NAL-TR-666] N82-12171

ATOMS

Interaction potentials between rare gas atoms and hologen atoms
[AD-A104836] N82-12899

ATS 1
Ionospheric propagation correction modeling for satellite altimeters
[NASA-CR-156881] N82-12447

ATTENUATION COEFFICIENTS
Estimation of the cumulative attenuation distribution due to rain on a path exceeding 1]lc2]km, given the cumulative distribution due to rain on a path of 1km — 94 GHz
[PHL-1980-13] N82-12328
Calibration of a turbidity meter for making estimates of total suspended solids concentrations and beam attenuation coefficients in field experiments
[NASA-TM-81873] N82-12655

ATTITUDE CONTROL
The dynamics and control of large flexible space structures
[NASA-CR-164982] N82-12096

AUDIOMETRY
An investigation of the status of bone conduction audiometer calibration in the National Health Service
[NPL-AC-101] N82-12769

AUDITORY PERCEPTION
Thresholds of hearing by air conduction and by bone conduction under different masking conditions
[NPL-AC-100] N82-12768

AUSTRALIA
Status of solar energy research and development in Australia
[NP-1903916] N82-12611
The Arrinthrunga formation: Upper Cambrian epeiric carbonates in the Georgina Basin, central Australia
[BMR-BULL-211] N82-12686
Gonadal doses from radiotherapy
[ARL/TR-020] N82-12762
Genetic and mean bone-marrow doses from medical use of unsealed radioisotopes
[ARL/TR-023] N82-12763

AUTOCORRELATION
Incoherent scatter ion line fitting package
[KGI-TR-032] N82-12321
Detecting outliers in energy time-series data
[DE81-030230] N82-12588

AUTOMATIC CONTROL
Study to define an approach for developing a computer-based system capable of automatic, unattended assembly/disassembly of spacecraft, phase 1
[NASA-CR-166740] N82-12092
Voltage test facility for defence standard 61-5
[NGTE-M-80112(L)] N82-12370
Automation of a specimen stage in an electron microphobe
[DE81-030691] N82-12422
Vertical-axis wind-turbine control strategy
[DE81-031932] N82-12591
Compilation of cell data bank for automation in diagnostic cytology
[BMFT-FB-T-80-156] N82-12742
Human control and regulation tasks N82-12787
Satisfactory solutions approach to control and optimization of large-scale systems N82-12883

AUTOMATIC CONTROL VALVES
Advanced electrofluidic servovalve development
[AD-A105172] N82-12361

AUTOMATIC PILOTS
Design of the space shuttle digital autopilot and resulting dynamic environment N82-12126

AUTOMATIC TEST EQUIPMENT
Vibration test procedures for accessory angle drive gearboxes on Atar 09C engines — turbojet engines
[AD-A105269] N82-12076
Requirements document for mini system test unit
[NASA-CR-167436] N82-12167

AUTOMOBILE ENGINES
AGT-102 automotive gas turbine
[NASA-CR-165353] N82-12444
Test results and facility description for a 40-kilowatt stirling engine
[NASA-TM-82620] N82-13013
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 1: Summary
[PB81-219479] N82-13018
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 2: Appendices A through C
[PB81-219487] N82-13019
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 3: Appendix D
[PB81-219495] N82-13020

AUTOMOBILE FUELS
Project for reliability fleet testing of alcohol/gasoline blends
[DE82-000004] N82-12250

AUTOMOBILES
Impact of fuel-economy shortfall: Trends in technology-weighted EPA versus on-road MPG. Periodic analysis memorandum no. 1
[DE81-030641] N82-12667
Cybernetics and car driving: A mathematical (computer) model for the system to be controlled
[IZF-1980-4] N82-12775
Cybernetics and car driving: A driver model and its experimental validation
[IZF-1980-13] N82-12776
Levels of steering control: Reproduction of steering wheel movements
[IZF-1980-16] N82-12777
Cybernetics and car driving: Perspective perception and the output vector of the system to be controlled
[IZF-1980-19] N82-12778
Method for estimating technological penetration rates in commercial automobile fleets
[DE82-000433] N82-13015

AUTOREGRESSIVE PROCESSES
Minimum mean square error prediction of autoregressive moving average time series
[AD-A104939] N82-12848
Autoregressive spectral estimation, log spectral smoothing and entropy
[AD-A104940] N82-12849
On some numerical properties of ARMA parameter estimation procedures
[AD-A104938] N82-12879

AVALANCHE DIODES
The effect of optically enhanced leakage current on S-band TRAPATT diode oscillators N82-12342

AVALANCHES
Effects of volcanism on the glaciers of Mount St. Helens
[USGS-CIRC-850-D] N82-12689

AVERAGE
Statistical averaging in position determination by holography under turbulence conditions N82-12417
Minimum mean square error prediction of autoregressive moving average time series
[AD-A104939] N82-12848

AVIONICS
Portable air driven variable speed fiber optic cable termination polisher
[AD-A104797] N82-12448
Hardware survey for the avionics test bed
[NASA-CR-161072] N82-12796

AXES OF ROTATION
German-Argentine experiment: Vertical-rotor wind engine N82-12648

AXIAL FLOW
On Vortex breakdown and instability
[AD-A104960] N82-12048

AXIAL LOADS
Biaxial tests of flat graphite/epoxy laminates
[NASA-CR-165793] N82-12141
Inelastic finite strain analysis of structural metals subjected to nonproportional loadings N82-12471

AXIAL STRAIN
The influence of deformation mode during cold forming on the post-formed flow and fracture behavior of low carbon and high strength low alloy steel sheets N82-12207
Effects of uniaxial stress on the Schottky-Barrier electroreflectance spectra of GaAs and GaP N82-12959

AXIAL STRESS
Influence of a multiaxial membrane stress situation on the stress concentration factor, using the example of an open unfinished drilled hole
[EK-43-B/251/79] N82-12484

AXISYMMETRIC BODIES
Observations of the effects of boundary layer and nuclei on cavitation of axisymmetric bodies
[AD-A104779] N82-12393

AXISYMMETRIC FLOW
The problem of axially symmetric flow of ideal rigid-plastic Huber-Mises medium without any specific hypotheses
[ISSN-0208-5658] N82-12463
The Numerical Studies Program for the Atmospheric General Circulation Experiment (AGCE) for Spacelab Flights
[NASA-CP-2200] N82-12715
Overview N82-12716
Hydrostatic calculations of axisymmetric flow and its stability for the AGCE model N82-12718
Cylindrical annulus models N82-12719
Spherical models: Basic states and stability N82-12720
Model verification studies using accurate measurements of spin up N82-12722

AZIMUTH
A pipelined digital SAR azimuth correlator using hybrid FFT/transversal-filter
[NASA-CASE-NPO-15519-1] N82-12296
Determination of geographic longitudes, latitudes and azimuths with the transit instrument AP in the test grid Westharz
[SER-B-249] N82-12532
Spherical models: Basic states and stability N82-12720
The three dimensional spherical model for the AGCE N82-12721
Effect of the orientation of the speaker's head and azimuth of a noise source on the speech reception threshold for sentences
[IZF-1980-18] N82-12896

B

BACKSCATTERING
Investigation of the electrochemical behavior of ion-implanted Ti-Pt alloys N82-12212
Progress in radar snow research — Brookings, South Dakota
[NASA-CR-166709] N82-12510

BACTERIA
An engineering study of bacterial kinetics and energetics N82-12740

BACTERIOLOGY
An engineering study of bacterial kinetics and energetics N82-12740

BALANCE
Computer aided balancing of UKIRT: A preliminary report — United Kingdom Infrared Telescope (UKIRT)
[UKIRT-15] N82-13028

BALL BEARINGS
Ball bearing evaluation for a high precision radiometer mirror drive
[ESA-(ESTL)47] N82-12458
Emission spectra from EHD contacts N82-12485

BANDWIDTH
Bandwidth constrained signal design for digital communication over Rayleigh Fading channels and Partial Band interference channels N82-12293
Small-channel effects in charge-coupled devices N82-12339

BARIUM COMPOUNDS
Scale prevention. Study on the crystallization of calcium sulfate and barium sulfate with and without inhibitors N82-12165

BAROCLINIC WAVES
The Numerical Studies Program for the Atmospheric General Circulation Experiment (AGCE) for Spacelab Flights
[NASA-CP-2200] N82-12715
The AGCE apperatus N82-12717
Hydrostatic calculations of axisymmetric flow and its stability for the AGCE model N82-12718

BARRIER LAYERS
Study of Al/Si interface by photoemission, Auger electron spectroscopies
[DESY-SR-80/08] N82-12979

BASIC (PROGRAMMING LANGUAGE)
Radio shack TRS-80 pocket computer solutions to composite materials formulas
[AD-A105173] N82-12145

BEAM INJECTION
Intense proton beam excitation of a high pressure argon-nitrogen laser N82-12430
Dynamics of an intense relativistic electron beam injected into full density air
[AD-A104743] N82-12901
Monte Carlo simulation of molecular flow in a neutral-beam injector and comparison with experiment
[DE82-000503] N82-12909

BEAMS (RADIATION)
Calibration of a turbidity meter for making estimates of total suspended solids concentrations and beam attenuation coefficients in field experiments
[NASA-TM-81673] N82-12655

BEAMS (SUPPORTS)
An improved model for soil-structure interaction analysis N82-12269
The behavior and strength of lapped splices in reinforced concrete beams subjected to cyclic loading N82-12470

BEARING (DIRECTION)
Effect of the orientation of the speaker's head and azimuth of a noise source on the speech reception threshold for sentences
[IZF-1980-18] N82-12896

BEARINGS
Assessment of rotor-bearing dynamics: A planning study for the utility industry
[DE81-904242] N82-12451

BEDS (PROCESS ENGINEERING)
Dynamic modeling and control structures for a tubular autothermal reactor at an unstable state N82-12162
Fundamental studies in continuous annular chromatography
[DE82-000519] N82-12190
Fixed-bed gasification
[DE82-000432] N82-12261
Heat transfer in a fixed bed and mass transfer in a counter-current moving bed N82-12373

BENZENE
Oxygen induced triplet state transitions of benzene in cryogenic solutions
[AD-A105432] N82-12900

BERNOULLI THEOREM
The queueing delay problem in multiple access schemes N82-12838

BETA PARTICLES
Disruption of high beta plasma induced by resistive drift mode
[IPPJ-538] N82-12939

BIAS
Estimation of bias errors in angle-of-arrival measurements using platform motion
[AD-A104742] N82-12309

BIBLIOGRAPHIES
Index of National Aviation Facilities Experimental Center technical reports 1972 - 1977
[AD-A104759] N82-12056
Energy: A continuing bibliography with indexes
[NASA-SP-7043(30)] N82-12536
Bibliography of the seasonal thermal energy storage library
[DE81-030470] N82-12586
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic-fuels production
[DE81-030671] N82-12673
Aerospace medicine and biology. A continuing bibliography with indexes, supplement 224
[NASA-SP-7011(224)] N82-12744
Radiation effects on living systems. A bibliography of AECL publications
[AECL-6797] N82-12759
Knowledge-based expert systems: A brief bibliography
[AD-A104793] N82-12840

BIG BANG COSMOLOGY
The Universe: Past and present reflections — big bang theory
[PREPRINT-70] N82-13032

BINARY ALLOYS
Gravitational influence on binary alloy melt equilibria and eutectic solidification N82-12215

BINOMIAL THEOREM
Fitting of negative binomial distributions using the APL program GRPFITNEG
[A-79-ST-44-24] N82-12680

BINOMIALS
Natural exponential families with quadratic variance functions
[P-6637] N82-12844

BIOASSAY
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic fuels production
[DE81-030822] N82-12661
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic-fuels production
[DE81-030671] N82-12673

BIOASTRONAUTICS
Biomedical research
[NASA-CR-3487] N82-12751

BIOCOMPATIBILITY
Research and development work concerning a fiber reinforced plastic material which is isoelastic to bone
[BMFT-FB-T-80-063] N82-12146

BIOCONVERSION
State of the art of methane gas enhancement in landfills
[DE82-000155] N82-12253
Interactive model to assess economics of anaerobic digestion of the farm
[DE82-000452] N82-12620
Basis for research proposals concerning (industrial) solar energy production processes derived from biological principles N82-12640

BIODEGRADATION
Ethanol production via fungal decomposition and fermentation of biomass
[DE82-000103] N82-12257

BIODYNAMICS
An engineering study of bacterial kinetics and energetics N82-12740
User's guide to BIODYN-80: An interactive software package for modeling biodynamic feedthrough to a pilot's hands, head and eyes
[AD-A104933] N82-12786

BIOENGINEERING
Environmenal pollutant studies, FY 1980
[DE81-028051] N82-12666
An engineering study of bacterial kinetics and energetics N82-12740
Biomedical technology transfer. Applications of NASA science and technology
[NASA-CR-164991] N82-13012

BIOGEOCHEMISTRY
Biogeochemical studies of technetium in marine and estuarine ecosystems
[DE81-030325] N82-12672
Biogeochemical evidence for subsurface hydrocarbon occurrence, recluse oil field, Wyoming: Preliminary results
[USGS-CIRC-837] N82-12693

BIOLOGICAL EFFECTS
Impact of energy-related pollutants on chromosome structure
[DE82-000153] N82-12670
Aerospace medicine and biology. A continuing bibliography with indexes, supplement 224
[NASA-SP-7011(224)] N82-12744
Repair of chemical damage in mammalian cells
[DE81-030823] N82-12757
Biological effects of low doses of ionizing radiation: Three review papers
[AECL-7059] N82-12758
Contributions to the genetic and mean bone-marrow doses of the Australian population from radiological procedures
[ARL/TR-017] N82-12764

BIOLOGICAL MODELS (MATHEMATICS)
An engineering study of bacterial kinetics and energetics N82-12740
User's guide to BIODYN-80: An interactive software package for modeling biodynamic feedthrough to a pilot's hands, head and eyes
[AD-A104933] N82-12786

BIOMASS
Technology assessment of solar energy systems: Potential soil erosion effects of harvesting crop residues for energy production
[DE82-000149] N82-12606
Costs for alternative grain-residue-collection systems
[DE81-029072] N82-12633
Treatment of biomass-gasification wastewaters using liquid-liquid extraction
[DE82-000711] N82-12662
An engineering study of bacterial kinetics and energetics N82-12740

BIOMASS ENERGY PRODUCTION
Partial acid hydrolysis pretreatment for enzymatic hydrolysis of cellulose: A process development study of ethanol production N82-12236
Ethanol production via fungal decomposition and fermentation of biomass, phase 2
[DE82-000104] N82-12256
Ethanol production via fungal decomposition and fermentation of biomass
[DE82-000103] N82-12257
Development of hydroconversion of biomass to synthetic fuels
[DE81-030954] N82-12280
Design, construction, and operation of a full scale experimental anaerobic fermentation facility
[DE81-029026] N82-12605
Status of solar energy research and development in Australia
[NP-1903916] N82-12611

BIOMETRICS
Biomedical research
[NASA-CR-3487] N82-12751

BIOPHYSICS
An engineering study of bacterial kinetics and energetics N82-12740

BIOREACTORS
Production of ammonia in a packed-bed, anaerobic upflow (ANFLOW) bioreactor
[DE81-030699] N82-12619

BIOSYNTHESIS
Design, construction, and operation of a full scale experimental anaerobic fermentation facility
[DE81-029026] N82-12605
An engineering study of bacterial kinetics and energetics N82-12740

BITUMENS
Characterization of western coals and coal macerals by solid state nuclear magnetic resonance spectroscopy
[DE81-028926] N82-12265

BIVARIATE ANALYSIS
Bivariate cumulants of a singly truncated bivariate normal distribution
[AD-A104914] N82-12647
Development and analysis of a modified screening procedure to increase acceptable product
[AD-A104936] N82-12874

BLADE TIPS
Experimental and analytical studies of a model helicopter rotor in hover
[NASA-TM-81232] N82-12042

BLANKETS (FUSION REACTORS)
Comments on the hydrogen solubility data for liquid lead, lithium and lithium-lead alloys and review of a tritium-solubility model for lithium-lead alloys — tritium breeding blanket
[DE81-030628] N82-12220
Inertial fusion program
[DE81-030512] N82-12954

BLOOD FLOW
Lateral migration of neutrally buoyant rigid spheres in small ducts — capillary blood flow
[MPIS-20/1980] N82-12406

BLOWING
An experimental study of massive blowing from a nosetip during Jovian entry
[NASA-CR-165756] N82-12366

BODY WEIGHT
Quantitation of tissue loss during prolonged space flight
[NASA-CR-167460] N82-12752

BOILERS
Industrial application of fluidized-bed combustion
[DE81-030272] N82-12182

BONE DEMINERALIZATION
Measurement of the bone mineral density of trabecular bone by a coherent and Compton scattering technique N82-12747

BONE MARROW
Measurement of gonadal and bone-marrow doses from dental radiography
[ARL/TR-022] N82-12761
Genetic and mean bone-marrow doses from medical use of unsealed radioisotopes
[ARL/TR-023] N82-12763

BONES
Research and development work concerning a fiber reinforced plastic material which is isoelastic to bone
[BMFT-FB-T-80-063] N82-12146
Thresholds of hearing by air conduction and by bone conduction under different masking conditions
[NPL-AC-100] N82-12766

An investigation of the status of bone conduction audiometer calibration in the National Health Service
[NPL-AC-101] N82-12769

BOREHOLES
Biaxial tests of flat graphite/epoxy laminates
[NASA-CR-165793] N82-12141

BORON CARBIDES
Optical constants of boron carbide
[AD-A106461] N82-12976

BOSONS
Application and description of the interacting Boson Model N82-12914

BOUNDARY LAYER CONTROL
In-duct viscous flow pressure distribution on a body with boundary layer control
[AD-A105996] N82-12394

BOUNDARY LAYER EQUATIONS
Experimental and analytical study of natural convection heat transfer of internally heated fluids N82-12378
A second-order accurate procedure for solving the boundary layer equations based on the predictor-corrector form of the Crank-Nicolson scheme
[NAL-TR-655T] N82-12384

BOUNDARY LAYER FLOW
Surface chemical reactions on stationary or rotating bodies in nonisothermal laminar boundary layer flows N82-12153
Observations of the effects of boundary layer and nuclei on cavitation of axisymmetric bodies
[AD-A104779] N82-12393

BOUNDARY LAYER SEPARATION
Unsteady boundary layer separation N82-12029

BOUNDARY LAYER STABILITY
Unsteady boundary layer separation N82-12029
HADY-I, a FORTRAN program for the compressible stability analysis of three-dimensional boundary layers — on swept and tapered wings
[NASA-CR-3467] N82-12388
Propagation on finite disturbances in the boundary layer
[MPIS-3/1981] N82-12415

BOUNDARY LAYER TRANSITION
Wake boundary layer interaction in turbomachinery N82-12026
Hydrostatic calculations of axisymmetric flow and its stability for the AGCE model N82-12718

BOUNDARY LAYERS
Description and calibration of the Langley unitary plan wind tunnel
[NASA-TP-1905] N82-12035
An experimental study of massive blowing from a nosetip during Jovian entry
[NASA-CR-165756] N82-12386
On the manipulation of spreading rates of forced mixing layers
[AD-A105236] N82-12390
Boundary detection criteria for satellite altimeters
[NASA-CR-156880] N82-12734

BOUNDARY VALUE PROBLEMS
Computation of general two-dimensional steady viscous flows
[AD-A105232] N82-12389
The problem of axially symmetric flow of ideal rigid-plastic Huber-Mises medium without any specific hypotheses
[ISSN-0208-5658] N82-12463
An error estimate for the H exp (-1) Galerkin method for a parabolic with non-smooth initial data
[CTH-MATH-1981-11] N82-12854
Application of the Osher-Engquist difference scheme and the full multigrid method to a two dimensional nonlinear elliptic model equation
[MC-NW-103/81] N82-12858

BOUSSINESQ APPROXIMATION
The three dimensional spherical model for the AGCE N82-12721

BREADBOARD MODELS
Data rate reduction, phase 2 — breadboard processor for multispectral imagery
[TNOT/0001/SAAB-ISSUE-3] N82-12829

BREMSSTRAHLUNG
Bremsstrahlung energy spectra from electrons of kinetic energy 1 keV less than or equal to T less than or equal to 2000 keV incident on neutral atoms 1 less than or equal to Z less than or equal to 92
[DE81-030964] N82-12902

BRILLOUIN EFFECT
A study of the phase transitions in benzil by Raman and Brillouin scattering techniques N82-12962

BRINES
Formation evaluation in liquid-dominated geothermal reservoirs
[DOE/ET-28384/T1] N82-12514

BROADBAND AMPLIFIERS
An advanced 500-MHZ-bandwidth fiber-optic signal link for EMP and general laboratory applications
[AD-A105118] N82-12314

BROADCASTING
Unifications and extensions of the multiple access communications problem N82-12289

BROMINE ISOTOPES
The handling, hazards, and maintenance of heavy liquids in the geologic laboratory
[USGS-CIRC-827] N82-12273

BRONZES
A phenomenological theory for predicting the temperature dependence of elastic compliance in simple proper ferroelectric tungstenbronzes N82-12214
Survey of nickel-aluminium-bronze casting alloys on marine applications
[AD-A105263] N82-12218

BUBBLES
A pulse-forming network for particle path visualization — at Ames Aeromechanics Water Tunnel Facility
[NASA-TM-81311] N82-12036
Ring eddy flow metamorphosis as a basis for implosion of partial vacuums, Schwenk's drop picture method and cutting by means of a water jet
[MPIS-13/1980] N82-12401

BUCKLING
The relation between welding parameters for a beam section and its buckling resistance
[CRIF-MT-143] N82-12454
Buckling of a thin initially wrinkled rectangular plate
[DE81-029963] N82-12479

BUILDINGS
Energy efficiency buildings program
[DE81-026050] N82-12276

BULK ACOUSTIC WAVE DEVICES
S-Band Shallow Bulk Acoustic Wave (SBAW) microwave source
[NASA-CR-166744] N82-12344

BUREAUS (ORGANIZATIONS)
Department of Energy projects
[DE82-000038] N82-12579

BY-PRODUCTS
Oxydesulfurization of coal by acidic iron sulfate solutions
[DE82-000464] N82-12199

C

CADMIUM
Solvent extraction studies using high-molecular-weight amines
[DE81-030061] N82-12191

CALCIUM COMPOUNDS
Scale prevention. Study on the crystallization of calcium sulfate and barium sulfate with and without inhibitors N82-12165

CALCIUM OXIDES
Soil stabilization by chemical additives — phosphoric acid and lime N82-12270

CALCULATORS
Radio shack TRS-80 pocket computer solutions to composite materials formulas
[AD-A105173] N82-12145

CALDERAS
Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Fernandian Caldera, Galapagos Islands, Ecuador N82-12496

CALIBRATING
AFFTC standard airspeed calibration procedures
[AD-A104830] N82-12074
On the flow measurements and velocity vector analysis using five-hole pitot tubes
[NAL-TR-666] N82-12385
Coordinate measurement by current division: A simple system for multichannel detectors
[DE81-030176] N82-12423
User's guide to the hydrogen monitor — high temperature gas cooled reactors
[DE81-032023] N82-12425
Calibration of a turbidity meter for making estimates of total suspended solids concentrations and beam attenuation coefficients in field experiments
[NASA-TM-81873] N82-12655
An investigation of the status of bone conduction audiometer calibration in the National Health Service
[NPL-AC-101] N82-12769

CALIFORNIA
Geophysical survey, Paso Robles geothermal area, California, part of the resource assessment of low- and moderate-temperature geothermal resource areas in California
[DE81-026038] N82-12517
Resource assessment of Low and Moderate-temperature geothermal waters in Calistoga, Napa County, California
[DE81-025559] N82-12518
Development of a marine monitoring program in California N82-12649

CALIFORNIUM ISOTOPES
User's guide to the hydrogen monitor — high temperature gas cooled reactors
[DE81-032023] N82-12425

CAMBERED WINGS
Low-speed measurements of the static pressure distribution and overall forces on a cambered and a symmetric mild gothic wing of aspect ratio 1.4
[RAE-TR-80066] N82-12027

CANADA
The Manicouagan impact structure observed from Skylab
[CONTRIB-544] N82-12497

CAPILLARY FLOW
Ion transport in charged porous media theory and experiments N82-12159
Diffusion of gases in capillaries
[DE82-000267] N82-12906

CAPILLARY TUBES
Diffusion of gases in capillaries
[DE82-000267] N82-12906

CARBOHYDRATE METABOLISM
Quantitation of tissue loss during prolonged space flight
[NASA-CR-167460] N82-12752

CARBOHYDRATES
Fermentation kinetics and process development for enhanced rate of production of ethanol from carbohydrates N82-12155

CARBON
Electrophotolysis oxidation system for measurement of organic concentration in water
[NASA-CASE-MSC-16497-1] N82-12166

CARBON COMPOUNDS
Cutting tool coatings program
[DE81-026269] N82-12449

CARBON DIOXIDE LASERS
Construction and characteristics of an optically pumped FIR-LMR spectrometer — far infrared (FIR) laser magnetic resonance (LMR) spectrometer
[MPIS-18/1980] N82-12438
Inertial fusion program
[DE81-030512] N82-12954

CARBON FIBER REINFORCED PLASTICS
Research and development work concerning a fiber reinforced plastic material which is isoelastic to bone
[BMFT-FB-T-80-063] N82-12148

CARBON FIBERS
Analysis of combustion of a composite plate
[AD-A104852] N82-12175

CARBON MONOXIDE
Carbon-supported iron catalysts for CO hydrogenation N82-12154
Preparation and evaluation of advanced electrocatalysts for phosphoric acid fuel cells
[NASA-CR-165519] N82-12573

CARBONATES
Solid-solid reactions in coal conversion processes N82-12236
The Arrinthrunga formation: Upper Cambrian epeiric carbonates in the Georgina Basin, central Australia
[BMR-BULL-211] N82-12686

CARCINOGENS
Repair of chemical damage in mammalian cells
[DE81-030623] N82-12757

CARDIOGRAMS
Medical diagnostic application of radiofrequency range electromagnetic waves N82-12746

CARIBBEAN SEA
SAGE measurements of the stratospheric aerosol dispersion and loading from the Soufriere Volcano
[NASA-TP-1922] N82-12687
CASCADE FLOW
Interaction of upstream flow distortions with high Mach number cascades
[NASA-TM-82759] N82-12043
CASCADE RANGE (CA-OR-WA)
Effects of volcanism on the glaciers of Mount St. Helens
[USGS-CIRC-850-D] N82-12689
CASSEGRAIN OPTICS
Alignment of the Cassegrain and Coude optics of the 3.8m UK infrared telescope; assessment of the optical performance and results of aberration calculations
[UKIRT-10] N82-13024
Thin mirror telescopes: Experience gained with the UK infrared telescope
[UKIRT-14] N82-13027
CAST ALLOYS
Mechanical properties of titanium castings
[DE81-030693] N82-12222
CASTINGS
Survey of nickel-aluminium-bronze casting alloys on marine applications
[AD-A105263] N82-12218
CATALYSIS
Palladium-catalyzed coupling reactions: Mechanism of reductive elimination
[DE81-030169] N82-12188
Electrocatalysis at oxide-covered metal electrodes
[DE81-027650] N82-12202
Selective separation of coal feedstocks for conversion by magnetic separation techniques
[DE81-028060] N82-12263
CATALYSTS
Carbon-supported iron catalysts for CO hydrogenation N82-12154
Behavior and morphology of palladium on alumina model catalysts in hydrogen and oxygen
N82-12163
Coprecipitated nickel-alumina methanation catalysts N82-12169
Catalytic hydrogenation of coal-derived liquids
[DE81-030485] N82-12198
Development of a process for recovery of valuable components from complex hydrodesulfurization catalysts especially tungsten, molybdenum, vanadium, nickel and cobalt
[BMFT-FB-T-80-186] N82-12204
Thermal processing of used catalysts
[BMFT-FB-T-80-189] N82-12205
Development of catalytic systems for the conversion of syngas to jet fuel and diesel fuel and higher alcohols
[DE82-000067] N82-12255
Synthesis gas conversion to liquid fuels using promoted fused iron catalysts ,
[DE81-030857] N82-12259
CATHODE RAY TUBES
Evaluation of Cathode-Ray Tube protection for the electronic tabular display subsystem (ETABS) engineering model
[AD-A105199] N82-12350
CATHODES
CRELA electron guns
[DE81-030703] N82-12923
CAVITATION CORROSION
Ring eddy flow metamorphosis as a basis for implosion of partial vacuums, Schwenk's drop picture method and cutting by means of a water jet
[MPIS-13/1980] N82-12401
CAVITATION FLOW
Observations of the effects of boundary layer and nuclei on cavitation of axisymmetric bodies
[AD-A104779] N82-12393
Ring eddy flow metamorphosis as a basis for implosion of partial vacuums, Schwenk's drop picture method and cutting by means of a water jet
[MPIS-13/1980] N82-12401
CAVITY RESONATORS
High efficiency SPS klystron design N82-12552
Analytic investigation of efficiency and performance limits in klystron amplifiers using multidimensional computer programs; multi-stage depressed collectors; and thermionic cathode life studies N82-12553
The Resonant Cavity Radiator (RCR) N82-12556
CELLS (BIOLOGY)
Compilation of cell data bank for automation in diagnostic cytology
[BMFT-FB-T-80-158] N82-12742
Chemical protection of cells in culture and mice against X-irradiation
[MBL-1979-2] N82-12743
Studies in erythropoiesis: The influence of the glycocalyx of the red cell membrane
[DE81-030666] N82-12760
CELLULOSE
Partial acid hydrolysis pretreatment for enzymatic hydrolysis of cellulose: A process development study of ethanol production N82-12236
CEMENTS
New building materials. A contribution to environmental protection. Subproject: Fly ash cement
[BMFT-FB-T-80-176] N82-12285
CENTAURUS CONSTELLATION
X-ray imaging observations of the radio galaxies Cen A, Vir A, and 3C273 N82-13021
CENTER OF GRAVITY
Computer aided balancing of UKIRT: A preliminary report — United Kingdom Infrared Telescope (UKIRT)
[UKIRT-15] N82-13028
CENTRAL NERVOUS SYSTEM
Neurotransmitter mechanisms in the nucleus accumbens septi and related regions in the rat brain
[NDRE/PUBL-81/1001] N82-12738
CENTRAL PROCESSING UNITS
New scheduler for job processing in computer systems
[NAL-TR-659] N82-12795
Data rate reduction, phase 2 — breadboard processor for multispectral imagery
[TNOT/0001/SAAB-ISSUE-3] N82-12829
CENTRIFUGES
Laminar-flow-cyclone development program
[DE81-001297] N82-12399
CERAMICS
Metals and ceramics division materials science program
[DE81-030697] N82-12137
Strength evaluation test of hot-pressed silicon nitride at room temperature
[NAL-TR-676] N82-12138
Application of high pressures to ceramics
[AD-A105249] N82-12231
Ceramic microstructure development
[AD-A105364] N82-12233
Holographic study of impact phenomena — airgun pellets on ceramic targets
[TPD-1980-0-3] N82-12429
Elastic domain wall waves in ferroelectric ceramics and single crystals
[AD-A105110] N82-12971
CERMETS
Microstructure formation in the Au-SiO2 cermet during annealing N82-12227
CERTIFICATION
Simulator certification methods and the vertical motion simulator
[NASA-CR-166252] N82-12082
CESIUM PLASMA
Study of radiatively sustained cesium plasmas for solar energy conversion
[NASA-CR-166265] N82-13039
CHANDRASEKHAR EQUATION
Singular perturbation modeling and its application to fast algorithms of Chandrasekhar type
N82-12610
CHANNEL FLOW
Deposition of particles in vertical conduits due to electrostatic charge, diffusion, and gravity
N82-12377
CHANNEL MULTIPLIERS
Coordinate measurement by current division: A simple system for multichannel detectors
[DE81-030176] N82-12423
CHANNELS (DATA TRANSMISSION)
Unifications and extensions of the multiple access communications problem N82-12289
A combined source-channel coding approach to image transmission N82-12291
Analysis of noncoherent multiple access communication channels N82-12292
Bandwidth constrained signal design for digital communication over Rayleigh Fading channels and Partial Band interference channels N82-12293
Data flow and bus structure in a loosely coupled multiprocessor computer system ARCADE
[ENST-C-81003] N82-12805
Integration of a detector array with an optical waveguide structure and applications to signal processing
[AD-A105067] N82-12932
CHARGE CARRIERS
Ion transport in charged porous media theory and experiments N82-12159
Fundamentals of magnetic interactions: New approaches to theory and experiment
[AD-A105003] N82-12887
CHARGE COUPLED DEVICES
Small-channel effects in charge-coupled devices
N82-12339
Integration of a detector array with an optical waveguide structure and applications to signal processing
[AD-A105067] N82-12932
CHARGE TRANSFER
Small-channel effects in charge-coupled devices
N82-12339
CHARGED PARTICLES
Pitch-angle diffusion in canonical coordinates: A theoretical formulation
[AD-A105392] N82-12701
CHARRING
Effects of preignition on pulverized coal combustion
[DE81-030170] N82-12195
CHEMICAL ANALYSIS
Applications of vibrating wire electrodes to electroanalysis N82-12148
Characterization of western coals and coal macerals by solid state nuclear magnetic resonance spectroscopy
[DE81-028928] N82-12265
Peat deposits of Dismal Swamp pocosins: Camden, Currituck, Gates, Pasquotank, and Perquimans Counties, North Carolina
[DE81-029642] N82-12524
Hydrogeochemical and stream sediment reconnaissance basic data for Wainwright Quadrangle, Alaska
[DE81-028670] N82-12528
Hydrogeochemical and stream sediment reconnaissance basic data for Point Lay Quadrangle, Alaska
[DE81-028669] N82-12529
Hydrogeochemical and stream sediment reconnaissance basic data for Teshekpuk Quadrangle, Alaska
[DE81-027406] N82-12531
Skylab water balance analysis
[NASA-CR-167461] N82-12753
CHEMICAL COMPOSITION
Data base for the analysis of compositional characteristics of coal seams and macerals
[DE81-031977] N82-12522
Mount St. Helens volcanic-ash fall in the Bull Run watershed, Oregon, March - June 1980
[USGS-CIRC-850-A] N82-12688
CHEMICAL EQUILIBRIUM
Simple code for chemical equilibrium and thermodynamic properties for use with GPSAP
[ANL/MHD-81-11] N82-12183
CHEMICAL EXPLOSIONS
Explosion experiments using cylindrical and conical charges
[N-40-1871-0] N82-12239
CHEMICAL LASERS
Scaling laws for pulsed chain-reaction chemical lasers
[AD-A104752] N82-12436
CHEMICAL MACHINING
Further investigation of etchants for chemically polishing SC-Cut quartz crystals
[AD-A104903] N82-12973
CHEMICAL PROPERTIES
Development of hydroconversion of biomass to synthetic fuels
[DE81-030954] N82-12260
CHEMICAL REACTIONS
Surface chemical reactions on stationary or rotating bodies in nonisothermal laminar boundary layer flows
N82-12153

Coal combustion in high convective flows
[DE81-030391] N82-12194
Effects of preignition on pulverized coal combustion
[DE81-030170] N82-12195
Pyrolysis of coal-drived fuels using the laser-powered homogeneous pyrolysis technique
[DE82-000251] N82-12196
Oxydesulfurization of coal by acidic iron sulfate solutions
[DE82-000464] N82-12199
Investigation of factors affecting the in-situ combustion retorting of oil shale
[DE82-000462] N82-12200
Dehydrogenation/hydrogenation reactions in hydroaromatic systems
[DE81-027667] N82-12201
Lagrangian measurements of sulfur dioxide to sulfate conversion rates
[DE82-000246] N82-12665
Interaction potentials between rare gas atoms and hologen atoms
[AD-A104696] N82-12899

CHEMICAL REACTORS
Dynamic modeling and control structures for a tubular autothermal reactor at an unstable state
N82-12162
Heat transfer in a fixed bed and mass transfer in a counter-current moving bed N82-12373
Interactive model to assess economics of anaerobic digestion of the farm
[DE82-000482] N82-12620

CHINESE PEOPLES REPUBLIC
China report: Science and technology, no. 133
[JPRS-79901] N82-12104
Use of SKW-9 single launch vehicle for three satellites described N82-12105
China report: Science and technology, no. 128
[JPRS-79047] N82-12769

CHIPS (ELECTRONICS)
Use of on-chip redundancy for fault-tolerant very large scale integrated circuit design N82-12332
A systolic 2-D convolution chip
[AD-A104672] N82-12351
Liquid immersion apparatus for minute articles
[NASA-CASE-MFS-25363-1] N82-12441

CHIRP SIGNALS
Implementation of SAW chirp transform and SAW convolvers in spread spectrum communication systems N82-12341
Cable-length-measurement system — CHIRP technique and Doppler effect
[DE81-030015] N82-12421

CHLORINATION
The kinetics of the reverse Deacon reaction
N82-12152
Hydrodesulfurization of chlorinated coal
[NASA-CASE-NPO-15304-1] N82-12240

CHROMATOGRAPHY
Fundamental studies in continuous annular chromatography
[DE82-000519] N82-12190

CHROMIUM
Performance of advanced chromium electrodes for the NASA Redox Energy Storage System
[NASA-TM-82724] N82-12574

CHROMIUM ALLOYS
A systematic study of the effects of 3d, 4f and 5f impurities on the critical temperature of superconducting Th; measurements to 20 kilobars
N82-12956

CHROMOSOMES
Impact of energy-related pollutants on chromosome structure
[DE82-000153] N82-12670

CHRONOLOGY
The Universe: Past and present reflections — big bang theory
[PREPRINT-70] N82-13032

CINEMATOGRAPHY
A pulse-forming network for particle path visualization — at Ames Aeromechanics Water Tunnel Facility
[NASA-TM-81311] N82-12036
Close-range cine-photogrammetry: A generalized technique for quantifying gross human motion
N82-12781

CIRCUIT BREAKERS
X-ray emission of high voltage vacuum devices
N82-12348

CIRCUIT DIAGRAMS
Computer-aided synthesis and design of Monolithic Microwave Integrated Circuits (MMICS) N82-12335

CIRCUIT PROTECTION
Use of on-chip redundancy for fault-tolerant very large scale integrated circuit design N82-12332

CIRCULAR CYLINDERS
Calculation and measurement of the turbulence of an incompressible flow in a labyrinth seal between a rotating shaft and a cylinder at rest
[EPFL-ITA-8] N82-12382

CIRCULAR POLARIZATION
Radar investigation of asteroids
[NASA-CR-164997] N82-13036

CITIES
Cultural features imaged and observed from Skylab 4 N82-12499

CIVIL AVIATION
Computer Air Carrier Symposium
[AD-A104894] N82-12054
Summary of Federal Aviation Administration responses to National Transportation Safety Board safety recommendations
[AD-A104922] N82-12055

CLAYS
Strain and pore pressure behavior of fine grained soils subjected to cyclic shear loading N82-12272
Simulation of the flow during stamping: Characteristics and application of modeling clay used for simulation of material flow in a forge
[CETIM-1.3K.26.2] N82-12286

CLEANING
ECR discharge cleaning experiment in the JIPP T-11
[IPPJ-539] N82-12940

CLIMATE
Meteorological and climatological investigation: Review of January - June 1980 investigative period
[DE81-030740] N82-12731

CLIMATOLOGY
Radiation budget measurement/model interface research
[NASA-CR-165000] N82-12699
Meteorological and climatological investigation: Review of January - June 1980 investigative report, volume 1
[DE81-030741] N82-12729
Meteorological and climatological investigation: Review of January - June 1980 investigative period, volume 2
[DE81-030742] N82-12730

CLINICAL MEDICINE
Gastrointestinal allergy in the experimental animal: The use of radioiodinated serum albumin in the assessment of new drugs
[IAEA-R-2067-F] N82-12741
Inventory of medical technological research in the Netherlands N82-12767
Biomedical technology transfer. Applications of NASA science and technology
[NASA-CR-164991] N82-13012

CLOSURES
Zipper rear closure endurance testing
[AD-A104732] N82-12785

CLOUD PHOTOGRAPHY
Meteorological lab applications of Skylab handheld-camera photographs N82-12506
Some aspects of tropical storm structure revealed by handheld-camera photographs from space
N82-12507
Mesoscale wake clouds in Skylab photographs
N82-12508
Mesoscale cloud features observed from Skylab
N82-12509

CLOUDS
Limit on remote FTIR detection of trace gases
[AD-A104842] N82-12511

CLUTTER
Multiple arrested synthetic aperture radar
N82-12295

CMOS
Integrated humidity sensor — relative humidity of air
[SMFT-FB-T-81-007] N82-12426

COAL
Metals and ceramics division materials science program
[DE81-030697] N82-12137
Assessment of pulverized-coal-fired combustor performance
[DE81-030660] N82-12187
Coal combustion in high convective flows
[DE81-030391] N82-12194
Effects of preignition on pulverized coal combustion
[DE81-030170] N82-12195
Solvent-Refined Coal (SRC) process
[DE81-031937] N82-12197
Oxydesulfurization of coal by acidic iron sulfate solutions
[DE82-000464] N82-12199
Supercritical multicomponent solvent coal extraction
[NASA-CASE-NPO-15767-1] N82-12241
Selective separation of coal feedstocks for conversion by magnetic separation techniques
[DE81-028060] N82-12263
Designing process wells for an underground coal-gasification environment
[DE81-028434] N82-12264
Characterization of western coals and coal macerals by solid state nuclear magnetic resonance spectroscopy
[DE81-028828] N82-12265
Evaluation of novel underground transport systems
[DE81-030279] N82-12520
Feasibility analysis of trench strip and auger mining
[DE81-027557] N82-12521
Data base for the analysis of compositional characteristics of coal seams and macerals
[DE81-031977] N82-12522
Extensible bridge-conveyor concepts for coal-mine face haulage
[DE81-031974] N82-12525
Environmental control technology for coal cleaning wastes
[DE81-025331] N82-12676

COAL DERIVED GASES
Feasibility and economic study of medium-Btu coal gas blended with high-Btu by-product gas as an industrial energy source at Billings, Montana
[DE81-030622] N82-12254

COAL DERIVED LIQUIDS
Pyrolysis of coal-drived fuels using the laser-powered homogeneous pyrolysis technique
[DE82-000251] N82-12196
Catalytic hydrogenation of coal-derived liquids
[DE81-030485] N82-12198
Measurement of thermal conductivities in coal fluids
[DE82-000523] N82-12400
Development of a thermodynamic properties correlation framework for the coal conversion industry, phase 1A
[DE81-030383] N82-12965

COAL GASIFICATION
Solid-solid reactions in coal conversion processes
N82-12236
Status of the Great Plains coal gasification plant
[EMD-81-84] N82-12242
Fixed-bed gasification
[DE82-000432] N82-12261
Density-measurement studies at the BI-GAS pilot plant
[DE82-000910] N82-12262
Designing process wells for an underground coal-gasification environment
[DE81-028434] N82-12264
Assessment of water supply contamination due to underground coal gasification
[PB81-209215] N82-12680

COAL LIQUEFACTION
Solvent-Refined Coal (SRC) process
[DE81-031937] N82-12197
Catalytic hydrogenation of coal-derived liquids
[DE81-030485] N82-12198
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic fuels production
[DE81-030822] N82-12681
Kinetics of wet oxidation of biological sludges from coal-conversion wastewater treatment
[DE82-000525] N82-12674

COAL UTILIZATION
Fuel nitrogen conversion during fuel rich combustion of pulverized coal and char N82-12158

Industrial application of fluidized-bed combustion
[DE81-030272] N82-12182
Hydrodesulfurization of chlorinated coal
[NASA-CASE-NPO-15304-1] N82-12240
A computer simulation modeling study to predict air quality impacts from a 500 MW coal-fired power plant N82-12650
Preliminary study: Use of low-sulfur coal and coal cleaning in control of acid rain
[DE81-028930] N82-12675

COASTAL ECOLOGY
Development of a marine monitoring program in California N82-12649
Policy and support for research in marine life sciences N82-12651

COASTAL WATER
Chemical and geochemical studies off the coast of Washington
[DE81-030319] N82-12513

COATING
The removal, mechanical handling and installation procedures for re-aluminising the UKIRT 3.8m primary mirror — United Kingdom Infrared Telescope (UKIRT)
[UKIRT-11] N82-13025

COATINGS
Cutting tool coatings program
[DE81-026289] N82-12449

COAXIAL CABLES
Antenna
[AD-A106521] N82-12312
Analysis of coaxial EMI feedthrough filters containing ferrite elements
[AD-A105248] N82-12353
Cable-length-measurement system — CHIRP technique and Doppler effect
[DE81-030015] N82-12421

COBOL
Restructuring COBOL programs to improve readability N82-12811

COCKPIT SIMULATORS
Pilot estimates of glidepath and aim point during simulated landing approaches
[NASA-TM-81325] N82-12772

CODE DIVISION MULTIPLEXING
Characteristics of a code division multiplex configuration with direct modulation
[REPT-442-TBR-81] N82-12318

CODING
A combined source-channel coding approach to image transmission N82-12291
User's guide to HELIOS: A computer program for modeling the optical behavior of reflecting solar concentrators. Part 1: Introduction and code input
[DE81-031920] N82-12616
Spherical models: Basic states and stability N82-12720

COEFFICIENTS
A design procedure for time-varying digital filters with highly quantized coefficients N82-12336
Technical heat and flow investigations into heat exchangers made out of synthetic materials, for use in dry cooling towers
[BMFT-FB-T-81-004] N82-12407

COGENERATION
Comparative economics of solar thermal central receivers
[DE81-029623] N82-12601
Basis for research proposals concerning (industrial) solar energy production processes derived from biological principles N82-12640

COHERENT ACOUSTIC RADIATION
Development and applications of computer-assisted acoustic holography N82-12418

COHERENT RADIATION
Coherent and incoherent radiation from free electron lasers with an axial guide field
[AD-A104806] N82-12434

COHERENT SCATTERING
Measurement of the bone mineral density of trabecular bone by a coherent and Compton scattering technique N82-12747

COHESION
Soil stabilization by chemical additives — phosphoric acid and lime N82-12270
Bibliographical study of nondestructive testing applicable to bonding
[CETIM-1.3N.20.2-PT-1] N82-12461

COILS
The stabilization of coal-oil mixtures N82-12237

COLD CATHODE TUBES
Field emission cold cathode devices based on eutectic systems
[AD-A104795] N82-12357

COLD WORKING
The influence of deformation mode during cold forming on the post-formed flow and fracture behavior of low carbon and high strength low alloy steel sheets N82-12207

COLLAGENS
Oxygen toxicity and lung collagenous protein
[AD-A104702] N82-12756

COLLIMATION
SPS large array simulation N82-12540
An active alignment scheme for the MPTS array N82-12541
Proposed experimental studies for assessing ionospheric perturbations on SPS uplink pilot beam signal N82-12543
An interferometer-based phase control system N82-12547
SPS phase control studies N82-12549
SPS fiber optic link assessment N82-12550

COLLISION PARAMETERS
Bremsstrahlung energy spectra from electrons of kinetic energy 1 keV less than or equal to T less than or equal to 2000 keV incident on neutral atoms 1 less than or equal to Z less than or equal to 92
[DE81-030984] N82-12902

COLLISIONS
Review of human and operational factors affecting the feasibility of the see-and-avoid concept
[DFVLR-MITT-81-13] N82-12790

COLUMNS (PROCESS ENGINEERING)
Separation via multi-column pH parametric pumping N82-12158
Control of high purity distillation columns N82-12160

COMBINATORIAL ANALYSIS
Optimal integer and fractional covers: A sharp bound on their ratio
[AD-A104829] N82-12886

COMBINED CYCLE POWER GENERATION
Investigation and research of specific combustion-turbine and combined-cycle field problems
[DE81-904231] N82-12592
Cost goals for a residential photovoltaic/thermal liquid collector system set in three northern locations
[DE81-029700] N82-12610

COMBUSTION
Coal combustion in high convective flows
[DE81-030391] N82-12194
Effects of preignition on pulverized coal combustion
[DE81-030170] N82-12195
Laser systems for the Combustion Research Facility: Orion
[DE81-030969] N82-12437
Combustion: An oil spill mitigation tool. Phase 2: The burning of the M/T BURMAH AGATE (ex-DANALAND)
[DE82-000527] N82-12663
Nuclear waste incineration technology status
[DE81-025751] N82-12926

COMBUSTION CHAMBERS
Assessment of pulverized-coal-fired combustor performance
[DE81-030860] N82-12187
Coal combustion in high convective flows
[DE81-030391] N82-12194
Low NO sub x heavy fuel combustor concept program
[NASA-CR-165512] N82-12572
Conversion of municipal solid waste to energy, Jacksonville, Florida, phase 1
[DE82-000806] N82-12613

COMBUSTION EFFICIENCY
Combustion and emission characteristics of a model gas turbine combustor burning lean heterogeneous mixtures — effect of degree of atomizing
[NAL-TR-686] N82-12171
Fines recycle modeling for an atmospheric fluidized-bed coal combustor — combustion efficiency
[DE81-904223] N82-12185
Coal combustion in high convective flows
[DE81-030391] N82-12194

COMBUSTION PHYSICS
Combustion experiments in space N82-12115
Advanced combustion/plume diagnostics
[AD-A105115] N82-12173
Analysis of combustion of a composite plate
[AD-A104852] N82-12175
Fundamental combustion studies of burning oil-spray flames
[DE81-904248] N82-12186

COMBUSTION PRODUCTS
Chemistry of combustion of fuel-water mixtures
[AD-A105401] N82-12178

COMET NUCLEI
Structure and origin of cometary nuclei
[NASA-TM-83823] N82-13035

COMMAND MODULES
PC-403: Pioneer Venus multiprobe spacecraft mission operational characteristics document, volume 2
[NASA-CR-166261-VOL-2] N82-12088

COMMERCIAL AIRCRAFT
Application of singular perturbation theory N82-12050
In-service inspection methods for graphite-epoxy structures on commercial transport aircraft
[NASA-CR-165746] N82-12142

COMMERCIAL ENERGY
Department of Energy Solar Central Receiver Semiannual Meeting
[SAND-80-8049] N82-12632

COMMUNICATION
UNIX NSW front end enhancements, volume 1
[AD-A105036] N82-12801
Privacy N82-12996

COMMUNICATION EQUIPMENT
Portable air driven variable speed fiber optic cable termination polisher
[AD-A104797] N82-12448

COMMUNICATION NETWORKS
Modeling and performance optimization of large-scale data-communication networks N82-12290
Analysis of noncoherent multiple access communication channels N82-12292
Message queueing delays in polling schemes with applications to data communication networks N82-12294
Combined report number 22. SATNET development and operation, Pluribus Satellite IMP development, remote site maintenance, internet development, mobile access terminal network, TCP for the HP3000, TCP-TAC, TCP for VAX-UNIX
[AD-A104931] N82-12313
Communicating graphics — via public data networks
[MC-IW-166/81] N82-12837

COMMUNICATION SATELLITES
Satellite maintenance in orbit N82-12098

COMMUNICATIONS TECHNOLOGY SATELLITE
Use of SKW-9 single launch vehicle for three satellites described N82-12105

COMPARISON
Comparison of residential window distributions and effects of mass and insulation
[DE81-027936] N82-12283

COMPILERS
Modular implementation of a digital hardware design automation system N82-12333
ALGOL 68 plus: A superlanguage of ALGOL 68 for processing the standard-prelude
[MC-IW-168/81] N82-12832

COMPLEX SYSTEMS
Satisfactory solutions approach to control and optimization of large-scale systems N82-12883

COMPOSITE MATERIALS
Investigation of the structural degradation and personnel hazards resulting from helicopter composite structures exposed to fires and/or explosions
[AD-A104757] N82-12057
Effect of fighter attack spectrum on composite fatigue life
[AD-A105034] N82-12143
Electromagnetic diffraction by a narrow slit in an impedance sheet-E-polarization
[AD-A105029] N82-12144
West Europe report: Science and technology, no. 72 — composite materials and energy technology
[JPRS-79676] N82-12645
Research and Technology
[NASA-TM-83221] N82-13043

COMPRESSIBLE BOUNDARY LAYER

HADY-I, a FORTRAN program for the compressible stability analysis of three-dimensional boundary layers — on swept and tapered wings
[NASA-CR-3467] N82-12388

COMPRESSION LOADS

Acoustic emission from concrete specimens
[AD-A105416] N82-12478

COMPRESSION TESTS

Compression stress relaxation testing for determining the performance of elastomeric fluid shells N82-12459

COMPRESSIVE STRENGTH

Properties of confined concrete subjected to static and dynamic loads N82-12468

COMPTON EFFECT

Measurement of the bone mineral density of trabecular bone by a coherent and Compton scattering technique N82-12747

X-ray imaging observations of the radio galaxies Cen A, Vir A, and 3C273 N82-13021

COMPUTATION

Transonic airfoil design of full potential flow. 1: Numerical procedure and its computational examples
[NAL-TR-672] N82-12036

Radio shack TRS-80 pocket computer solutions to composite materials formulas
[AD-A105173] N82-12145

Antenna
[AD-A106521] N82-12312

The method of Frieman and Kroll for the calculation of electromagnetic fields and its application to data inversion
[AD-A104809] N82-12315

Computation of general two-dimensional steady viscous flows
[AD-A105232] N82-12389

Solution of nonlinear structural problems using array processors
[AD-A104987] N82-12800

Minimizing computational cost for dynamic programming algorithms
[AD-A104792] N82-12818

A model for uncoordinated distributed computation of fixed points
[AD-A104819] N82-12850

Comparison of results between the ballooning modes codes BLOON and BALOON
[DE81-030259] N82-12949

COMPUTATIONAL FLUID DYNAMICS

Calculation of stationary transonic flows using the integral equation method
[REPT-374] N82-12049

Computational fluid mechanics and its impact on the aircraft aerodynamicist
[DGLR-PAPER-81-3] N82-12409

A solution of the Navier-Stokes equations by a mixed finite element method
[ESA-TT-720] N82-12416

Calculation of transient and quasi-stationary flows in high temperature reactors with spherical nuclear fuel elements, using the vortex flow method
[IKE-4-96] N82-12926

COMPUTER COMPONENTS

Recognize regular languages with programmable building blocks
[AD-A104874] N82-12816

Trends in computer technology N82-13002

Multicast and synchronization in distributed systems — algorithms
[CTH-81.2-R] N82-12835

Knowledge-based expert systems: A brief bibliography
[AD-A104793] N82-12840

Study on a refined image processing system for space astronomy
[ESA-CR(P)-1458] N82-13017

COMPUTER SYSTEMS PERFORMANCE

Evaluation of microprocessors for process control applications N82-12807

An operational approach to requirements specification for embedded systems
[AD-A105459] N82-12821

COMPUTER SYSTEMS PROGRAMS

Tracking procedures for FUCAS — phased array radar
[PHL-1980-45] N82-12329

Modular implementation of a digital hardware design automation system N82-12333

New scheduler for job processing in computer systems
[NAL-TR-659] N82-12795

ALGOL 68 plus: A superlanguage of ALGOL 68 for processing the standard-prelude
[MC-IW-168/81] N82-12832

COMPUTER SYSTEMS SIMULATION

New scheduler for job processing in computer systems
[NAL-TR-659] N82-12795

System software for the ESTEC multiprocessor reconfigurable simulator
[ESA-CR(P)-1456] N82-12830

COMPUTER TECHNIQUES

Application of Kalman filtering in computer relaying of power systems N82-12338

Interactive computer methods for generating mineral-resource maps
[CIRC-815] N82-12527

Methodical study of the contribution of the human system to the insecurity of technological systems — computerized accident analysis N82-12788

Development of elemental analyzer to programmable calculator interface
[DE82-000895] N82-12802

Velocity-space synthesis of ISEE-1 measurements of the three dimensional electron distribution function
[NASA-TM-83838] N82-12813

Computer-based national information systems: Technology and public policy issues
[OTA-CIT-146] N82-12989

Computer-based national information systems: Technology and public policy issues. Summary N82-12990

Background and purpose of the study N82-12991

Information systems and computers N82-12992

Innovation, productivity, and employment N82-12995

Trends in computer technology N82-13002

Computer aided balancing of UKIRT: A preliminary report — United Kingdom Infrared Telescope (UKIRT)
[UKIRT-15] N82-13028

COMPUTERIZED DESIGN
Subcritical and supercritical airfoils for given pressure distribution N82-12031
Modular implementation of a digital hardware design automation system N82-12333
Computer-aided synthesis and design of Monolithic Microwave Integrated Circuits (MMICS) N82-12335
Singular perturbation modeling and its application to fast algorithms of Chandrasekhar type
N82-12810
Transonic airfoil design of full potential flow. 2: Development of the FORTRAN code
[NAL-TR-673] N82-12814
SCALD 2 logic simulator
[DE81-030879] N82-12827
Technology of tomorrow: Computer assisted design and fabrication
[CETIM-1.4A.32.3] N82-12828

COMPUTERIZED SIMULATION
Advanced Shuttle Simulation Turbulence Tapes (SSTT) users guide
[NASA-CR-161890] N82-12106
Application of the Pisces two dimensional ELK program to explosion calculations
[N-40-2815-0] N82-12267
Advective effects in the numerical simulation of long period, large amplitude wave behavior
[AD-A105231] N82-12391
Hydrologic studies support, INTERCOMP code conversion
[DE81-030318] N82-12515
SPS large array simulation N82-12540
Performance analysis and simulation of the SPS reference phase control system N82-12544
Application of different KFA-models in the framework of the energy research programme of the European Communities
[EUR-6758-EN] N82-12597
User's guide to BIODYN-80: An interactive software package for modeling biodynamic feedthrough to a pilot's hands, head and eyes
[AD-A104933] N82-12786
SCALD 2 logic simulator
[DE81-030679] N82-12827
Diffusion of gases in capillaries
[DE82-000267] N82-12908
Monte Carlo simulation of molecular flow in a neutral-beam injector and comparison with experiment
[DE82-000503] N82-12909

COMPUTERS
Radio shack TRS-80 pocket computer solutions to composite materials formulas
[AD-A105173] N82-12145
Hardware survey for the avionics test bed
[NASA-CR-161072] N82-12796
Industry structure N82-13003

CONCENTRATION (COMPOSITION)
Remote determination of atmospheric gases with a DF laser
[GKSS-80-E-40] N82-12711

CONCENTRATORS
Near-term improvements in parabolic troughs: An economic and performance assessment
[DE82-001158] N82-12615

CONCRETE STRUCTURES
Properties of confined concrete subjected to static and dynamic loads N82-12468
The behavior and strength of lapped splices in reinforced concrete beams subjected to cyclic loading N82-12470
Acoustic emission from concrete specimens
[AD-A105416] N82-12478

CONCRETES
Passive-solar-retrofit study for the United States Navy
[DE81-028921] N82-12629

CONDENSATES
Infrared reflectance and refractive index measurements in vacuum-rated hemiellipsoidal mirror reflectometer from 20 to 300 deg K — gas condensates on mirror surfaces
[AD-A105113] N82-12933

CONDENSING
Cryogenic deposition, desorption, and reaction studies of stratospherically relevant species
N82-12161

CONDUCTIVE HEAT TRANSFER
Analytical solution of anisotropic heat conduction in simple and irregular regions N82-12379
Development of an improved high performance artery heat pipe
[ESA-CR(P)-1459] N82-12410

CONFERENCES
A symposium on transonic flow research
[AD-A104871] N82-12044
Spacecraft Dynamics as Related to Laboratory Experiments in Space — conference
[NASA-CP-2199] N82-12109

CONFIDENCE LIMITS
Confidence interval estimation and tests for temporary outmigration in tag-recapture studies
N82-12873

CONICAL SCANNING
Tracking procedures for FUCAS — phased array radar
[PHL-1980-45] N82-12329

CONIFERS
User manual for SILVA: A computer code for estimating effects of pollution on the growth and succession of Western coniferous forests
[DE82-000134] N82-12664

CONSTITUTION
Constitutional rights N82-13000

CONSTITUTIVE EQUATIONS
Properties of confined concrete subjected to static and dynamic loads N82-12468
Inelastic finite strain analysis of structural metals subjected to nonproportional loadings N82-12471

CONSTRUCTION
Vocational-Technical Instructors Passive-Solar Training Workshop
[DE81-030055] N82-12622
Solar explosion
[DE81-026086] N82-12628

CONSTRUCTION MATERIALS
New building materials. A contribution to environmental protection. Subproject: Fly ash cement
[BMFT-FB-T-80-176] N82-12285
Passive-solar-retrofit study for the United States Navy
[DE81-028921] N82-12629

CONTAINERLESS MELTS
Analysis of SPAR 6 single-axis levitation experiment
[NASA-TM-82447] N82-12093

CONTAMINANTS
Impact of energy-related pollutants on chromosome structure
[DE82-000153] N82-12670

CONTINENTAL SHELVES
Chemical and geochemical studies off the coast of Washington
[DE81-030319] N82-12513

CONTOURS
Long ocean waves on linearly varying bottom topographies N82-12733

CONTRACT MANAGEMENT
An exploratory study of costs to operate Government-Owned, Contractor-Operated (GOCO) facilities
[AD-A104854] N82-12986

CONTRACT NEGOTIATION
Patent licensing contracts in the electronic industry — Denmark
[ECR-104] N82-13011

CONTROL EQUIPMENT
Laser systems for the Combustion Research Facility: Orion
[DE81-030989] N82-12437

CONTROL SURFACES
Wind-tunnel investigation of the side-force of rectangular winglets on the tip of a rectangular wing
[NAL-TR-669] N82-12037

CONTROL THEORY
Computational metnods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164983] N82-12080
Fixed gain controller design for aircraft
[AD-A104877] N82-12081
The magnetosiatic force produced by current loops and is medical applications N82-12748

CONTROL VALVES
Method and system for nuclear waste disposal — control valves for encapsulating wastes
[NASA-CASE-NPO-15454-1] N82-12916

CONTROLLERS
Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164983] N82-12080

CONVECTIVE FLOW
Convection in fluids at reduced gravity
N82-12119
Transient thermal convection in microgravity
N82-12121

CONVECTIVE HEAT TRANSFER
Experimental and analytical study of natural convection heat transfer of internally heated fluids
N82-12378
Quasi-stationary approximation for the Stefan problem with a convective boundary condition
[DE81-030372] N82-12395
Methods of calculating heat transfer within the passages of heat exchangers
[HTS/81/4] N82-12411

CONVEYORS
Extensible bridge-conveyor concept development
[DE81-031973] N82-12519
Extensible bridge-conveyor concepts for coal-mine face haulage
[DE81-031974] N82-12525
Acoustic system for material transport
[NASA-CASE-NPO-15453-1] N82-12889

CONVOLUTION INTEGRALS
Efficient structure, and algorithms for digital signal processing N82-12296

COOLING SYSTEMS
A vapour cycle cabin cooling system for the Sea King MK.50 helicopter
[AD-A105211] N82-12069
Technical heat and flow investigations into heat exchangers made out of synthetic materials, for use in dry cooling towers
[BMFT-FB-T-81-004] N82-12407
Advanced cooling full-scale engine demonstration
[DE81-904253] N82-12452

COORDINATE TRANSFORMATIONS
Analytical solution of anisotropic heat conduction in simple and irregular regions N82-12379
Two-dimensional mesh ajustment algorithm
[AD-A105439] N82-12853

COORDINATES
Control systems improvements in a precision coordinate measuring machine
[DE82-000024] N82-12261

COPPER
Fatigue phenomena in copper
[RISO-M2241] N82-12225

COPPER ALLOYS
X-ray scattering investigation of microalloying and defect structure in ion implanted copper
[AD-A105442] N82-12967

COPPER OXIDES
Investigation of solar cells based on Cu2 — with emphasis on junction fabrication
[DE81-030274] N82-12607

CORRELATION
Development of a thermodynamic properties correlation framework for the coal conversion industry, phase 1A
[DE81-030363] N82-12985

CORRELATORS
A pipelined digital SAR azimuth correlator using hybrid FFT/transversal-filter
[NASA-CASE-NPO-15519-1] N82-12298

CORROSION
Investigation of the electrochemical behavior of ion-implanted Ti-Pt alloys N82-12212

CORROSION PREVENTION
Scale prevention. Study on the crystallization of calcium sulfate and barium sulfate with and without inhibitors N82-12165
Substituting copper alloy tubes in old sea water condensers
[VTT-87] N82-12226

CORROSION RESISTANCE
Survey of nickel-aluminium-bronze casting alloys on marine applications
[AD-A105263] N82-12218

COSMIC DUST
Structure and origin of cometary nuclei
[NASA-TM-83823] N82-13035

COSMOLOGY
Topics in the evolution of cosmological perturbations N82-13029

COST ANALYSIS
Extensible bridge-conveyor concepts for coal-mine face haulage
[DE81-031974] N82-12525
Benefit-cost analysis with uncertain information: An application in air pollution control N82-12652
An exploratory study of costs to operate Government-Owned, Contractor-Operated (GOCO) facilities
[AD-A104854] N82-12986

COST EFFECTIVENESS
Rectenna session: Micro aspects N82-12562

COST REDUCTION
Air circuit with heating pump
[BMFT-FB-T-80-168] N82-12404
Minimizing computational cost for dynamic programming algorithms
[AD-A104792] N82-12816

COUNTERFLOW
High-temperature counter-flow recuperator
[DE81-031923] N82-12424

COUNTERS
Efficient implementations of multicounter machines for oblivious Turing machines, acyclic logic networks, and VLSI
[MC-IW-167/81] N82-12806

COUPLING
Effects of aerodynamic coupling on the dynamics of roll aircraft N82-12070

COVALENT BONDS
Study of Al/Si interface by photoemission, Auger electron spectroscopies
[DESY-SR-80/06] N82-12979

COVARIANCE
The finite memory prediction of covariance stationary time series
[AD-A105413] N82-12878

COVERINGS
Testing of solar cell covers and encapsulants conducted in a simulated space environment
[NASA-CR-165475] N82-12571

CRACK INITIATION
A fundamental study of fatigue in powder metallurgy aluminum alloys
[AD-A105060] N82-12219
Fracture mechanisms of sensitized stainless steels in sulfur-containing environments
[DE81-026052] N82-12482

CRACK PROPAGATION
A fundamental study of fatigue in powder metallurgy aluminum alloys
[AD-A105060] N82-12219
Prefracture behavior of solid propellants
[AD-A104746] N82-12247
Viscoplastic and creep crack growth analysis by the finite element method
[AD-A105120] N82-12476
Miniaturized fatigue crack growth specimen technology and results
[DE81-029757] N82-12481

CREW PROCEDURES (INFLIGHT)
Crew activities in space N82-12129
An investigation into pilot and system response to critical in-flight events. Volume 1: Executive summary
[NASA-CR-164993] N82-12782
An investigation into pilot and system response to critical in-flight events. Volume 2: Appendix
[NASA-CR-164994] N82-12783

CRITICAL LOADING
A critical void growth failure criterion developed for dynamic and static loading conditions N82-12469

CRITICAL PATH METHOD
Norm conditions for the path regularity of random processes
[CTH-MATH-1981-12] N82-12881

CRITICAL POINT
Defining critical point experiments for a space laboratory N82-12110

CRITICAL TEMPERATURE
A systematic study of the effects of 3d, 4f and 5f impurities on the critical temperature of superconducting Th; measurements to 20 kilobars N82-12958

CROSS CORRELATION
Application of the three beam laser cross correlation technique in the exhaust plume of a liquid fuelled rocket motor
[AASU-343] N82-12134

CROSS COUPLING
Evaluation and wind tunnel tests of the 4,000 lb (normal-force) pitch/yaw and roll dynamic stability balance systems for measuring direct, cross, and cross-coupling derivatives
[AD-A105122] N82-12047

CROSSED FIELD AMPLIFIERS
The adapting of the crossed-field directional amplifier to the requirements of the SPS N82-12554

CRUSTAL FRACTURES
NASA geodynamics program
[NASA-TM-84010] N82-12697

CRYOGENIC EQUIPMENT
Cryogenic deposition, desorption, and reaction studies of stratospherically relevant species N82-12161

CRYOGENIC FLUIDS
Oxygen induced triplet state transitions of benzene in cryogenic solutions
[AD-A105432] N82-12900

CRYOPUMPING
Monte Carlo simulation of molecular flow in a neutral-beam injector and comparison with experiment
[DE82-000503] N82-12909

CRYSTAL DISLOCATIONS
Acoustic emission of plastic flow in metals and alloys N82-12208
Photovoltaic mechanisms in polycrystalline thin film silicon solar cells
[DE81-030370] N82-12606
X-ray scattering investigation of microalloying and defect structure in ion implanted copper
[AD-A105442] N82-12967
Characterization of as-grown dislocation structure in niobium by X-ray diffraction topography
[AD-A105431] N82-12969

CRYSTAL GROWTH
Modeling of thin-film GaAs growth
[NASA-CR-164992] N82-12965
Surface structure and growth of crystalline materials
[AD-A105223] N82-12968

CRYSTAL LATTICES
TDPAC study of the In2Se3 crystal structure
[AD-A104729] N82-12974

CRYSTAL STRUCTURE
Survey of nickel-aluminium-bronze casting alloys on marine applications
[AD-A105263] N82-12218
Prediction of crystal densities of organic explosives by group additivity
[DE81-032016] N82-12249
Surface structure and growth of crystalline materials
[AD-A105223] N82-12968
Characterization of as-grown dislocation structure in niobium by X-ray diffraction topography
[AD-A105431] N82-12969

CRYSTALLINITY
Mechanical properties and hydrogen embrittlement of scandium
[DE81-030745] N82-12221
Prediction of crystal densities of organic explosives by group additivity
[DE81-032016] N82-12249

CRYSTALLITES
Carbon-supported iron catalysts for CO hydrogenation N82-12154
Behavior and morphology of palladium on alumina model catalysts in hydrogen and oxygen N82-12163

CRYSTALLIZATION
Scale prevention. Study on the crystallization of calcium sulfate and barium sulfate with and without inhibitors N82-12165

CULTURE TECHNIQUES
Method and apparatus for detecting coliform organisms
[NASA-CASE-ARC-11322-1] N82-12739
Chemical protection of cells in culture and mice against X-irradiation
[MBL-1979-2] N82-12743

CURRENT DISTRIBUTION
Coordinate measurement by current division: A simple system for multichannel detectors
[DE81-030176] N82-12423
Toward an understanding of the turbulent electrode effect over land
[AD-A104902] N82-12700

CUTTERS
Cutting tool coatings program
[DE81-026289] N82-12449

CUTTING
Automated X-ray orientation for quartz crystal resonators
[AD-A104945] N82-12977

CYBERNETICS
Cybernetics and car driving: A mathematical (computer) model for the system to be controlled
[IZF-1980-4] N82-12775
Cybernetics and car driving: A driver model and its experimental validation
[IZF-1980-13] N82-12776
Cybernetics and car driving: Perspective perception and the output vector of the system to be controlled
[IZF-1980-19] N82-12778

CYCLIC LOADS
Biaxial tests of flat graphite/epoxy laminates
[NASA-CR-165793] N82-12141
Strain and pore pressure behavior of fine grained soils subjected to cyclic shear loading N82-12272
Some aspects of skin friction of piles in clay under cyclic loading
[PB81-226730] N82-12288
The behavior and strength of lapped splices in reinforced concrete beams subjected to cyclic loading N82-12470
Inelastic finite strain analysis of structural metals subjected to nonproportional loadings N82-12471

CYCLONES
Meteorological lab applications of Skylab handheld-camera photographs N82-12506

CYLINDRICAL BODIES
Acoustic emission from concrete specimens
[AD-A105416] N82-12478

CYLINDRICAL SHELLS
Vibration of cylindrical shells and panels of oval cross-section N82-12486

CYLINDRICAL WAVES
Cylindrical annulus models N82-12719
Interaction of ion-acoustic solitions in multi-dimensional space, 2
[IPPJ-535] N82-12941

CYTOLOGY
Compilation of cell data bank for automation in diagnostic cytology
[BMFT-FB-T-80-156] N82-12742

D

DAMAGE ASSESSMENT
Investigation of severe lightning strike incidents to two USAF F-106A aircraft
[NASA-CR-165794] N82-12052
Holographic study of impact phenomena — airgun pellets on ceramic targets
[TPD-1980-0-3] N82-12429

DAMPING
Experimental and analytical studies of advanced air cushion landing systems
[NASA-CR-3476] N82-12065

DAMS
Modular hydro dam approach to the economic development of ultra low-head hydropower
[DE81-027817] N82-12635

DATA ACQUISITION
Application of Pulse Code Modulation (PCM) technology to aircraft dynamics data acquisition
[AD-A104775] N82-12068
AFFTC standard airspeed calibration procedures
[AD-A104830] N82-12074
Meteorological and climatological investigation: Review of January - June 1980 investigative period
[DE81-030740] N82-12731

DATA BASE MANAGEMENT SYSTEMS
Solar Energy Information Data Bank (SEIDB) program, FY 1981
[DE81-030054] N82-12812
Optimal synchronization for a distributed database N82-12791

The GLAS editing procedures for the FGGE level II-B data collected during SOP-1 and 2
[NASA-TM-83811] N82-12794
Use of an engineering data management system in the analysis of space shuttle orbiter tiles
[NASA-TM-83215] N82-12815
Redundancy versus query time trade-offs for data structures N82-13004
Preliminary internal data screening: A component of quantitative data analysis in data validation
[DE81-000802] N82-13008

DATA BASES
Optimal synchronization for a distributed database
N82-12791
Deferring updates in a relational data base system
[P-6634] N82-12793
Abstract data types and data bases N82-13005

DATA COMPRESSION
A combined source-channel coding approach to image transmission N82-12291
Effect of reference set selection on speaker dependent speech recognition: Frame compression in isolated word recognition
[AD-A104794] N82-12307

DATA LINKS
Handbook for the estimation of microwave propagation effects: Link calculations for earth-space paths (path loss and noise estimation)
[NASA-CR-165002] N82-12301
Performance evaluation of the virtual subchannel concept for satellite link communication
[ENST-D-81002] N82-12324

DATA MANAGEMENT
Comparative study of nonlinear time warping techniques in isolated word speech recognition systems
[AD-A104865] N82-12308
Oceanographic technology information service: User's guide
[AD-A104670] N82-12736
Deferring updates in a relational data base system
[P-6634] N82-12793
Abstract data types and data bases N82-13005

DATA PROCESSING
PC-403: Pioneer Venus multiprobe spacecraft mission operational characteristics document, volume 2
[NASA-CR-166261-VOL-2] N82-12086
Feasibility study of device synthesis of non-linear filters
[AD-A105417] N82-12354
Detecting outliers in energy time-series data
[DE81-030230] N82-12586
New scheduler for job processing in computer systems
[NAL-TR-669] N82-12795
Government management of data processing
N82-12998
Industry structure N82-13003
Preliminary internal data screening: A component of quantitative data analysis in data validation
[DE81-000802] N82-13008
Data reduction and analysis for the graphite crystal X-ray spectrometer and polarimeter experiment flown aboard OSO-8 spacecraft
[NASA-CR-166749] N82-13030

DATA PROCESSING EQUIPMENT
Development of elemental analyzer to programmable calculator interface
[DE82-000895] N82-12802
BENORSY: A formalized instrument for the user oriented revision of dp-systems
[BMFT-FB-DV-81-001] N82-12804
Data rate reduction, phase 2 — breadboard processor for multispectral imagery
[TNOT/0001/SAAB-ISSUE-3] N82-12829

DATA RECORDING
Preliminary internal data screening: A component of quantitative data analysis in data validation
[DE81-000802] N82-13008

DATA REDUCTION
Incoherent scatter ion line fitting package
[KGI-TR-032] N82-12321

DATA SAMPLING
A regression design approach to optimal and robust spacing selection
[AD-A104728] N82-12846
On probability proportional to size sampling designs: Their construction, algebraic properties, and applications N82-12871

DATA STORAGE
Video discs: Their application to information storage and retrieval
[NRCD-12] N82-13006
Defense Technical Information Center free text experiment: Technical report file
[AD-A105449] N82-13007

DATA SYSTEMS
Message queueing delays in polling schemes with applications to data communication networks
N82-12294
Hardware survey for the avionics test bed
[NASA-CR-161072] N82-12798
Fault testing and diagnosis implementation in microprocessor controlled data networks
[ESNT-D-81001] N82-12836

DATA TRANSMISSION
Modeling and performance optimization of large-scale data-communication networks
N82-12290
Columbus, Ohio, Voice response system demonstration and evaluation
[AD-A104750] N82-12304
Data flow and bus structure in a loosely coupled multiprocessor computer system ARCADE
[ENST-C-81003] N82-12805
Communicating graphics — via public data networks
[MC-IW-166/81] N82-12837

DECELERATION
Dynamic behavior of particles in spacecraft
N82-12125

DECISION MAKING
A land use decision methodology for mine lands in Appalachia
[PB81-220113] N82-12676
Pilot estimates of glidepath and aim point during simulated landing approaches
[NASA-TM-81325] N82-12772
An investigation into pilot and system responses to critical in-flight events. Volume 1: Executive summary
[NASA-CR-164993] N82-12782
Topical survey, 1980-1981 — game-theoretic models of multiperson decision problems
[AD-A105117] N82-12884

DECISION THEORY
Topical survey, 1980-1981 — game-theoretic models of multiperson decision problems
[AD-A105117] N82-12884

DECOMPOSITION
Pyrolysis of coal-drived fuels using the laser-powered homogeneous pyrolysis technique
[DE82-000251] N82-12196
Investigation of factors affecting the in-situ combustion retorting of oil shale
[DE82-000482] N82-12200

DEEP DRAWING
Lubrication during drawing: Bibliographical analysis and results, volume 1 — lubricant tests for a metal forming process
[CETIM-13-Y-152-VOL-1] N82-12456

DEEP SCATTERING LAYERS
Regional dependence of very low-frequency sound attenuation in the deep sound channel: Correlation with internal wave measurements
[AD-A105061] N82-12892

DEFECTS
Silicon quality: A consideration for VHSI circuit development
[AD-A105198] N82-12355

DEFLAGRATION
The transition from deflagration to detonation
N82-12380

DEFORMATION
Buckling of a thin initially wrinkled rectangular plate
[DE81-029963] N82-12479

DEHYDRATION
Behavior of alkali metal-acid phosphates during elevated temperature water electrolysis
[DE82-000243] N82-12181

DEHYDROGENATION
Dehydrogenation/hydrogenation reactions in hydroaromatic systems
[DE81-027667] N82-12201

DELAY
Message queueing delays in polling schemes with applications to data communication networks
N82-12294

DELTA WINGS
On Vortex breakdown and instability
[AD-A104860] N82-12048

DEMAND (ECONOMICS)
Assessment of potential future markets for the production of hydrogen from water
[BMFT-FB-T-81-012] N82-12266
Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 1: Energy-conserving design for residential structures
[DE82-900206] N82-12278
Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 2: Domestic hot water systems
[DE82-900207] N82-12279
Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 3: Customer load management systems
[DE82-900208] N82-12280

DENITROGENATION
Process for the denitrification of high-level radioactive liquid wastes
[DE81-026875] N82-12925

DENMARK
Patent licensing contracts in the electronic industry — Denmark
[ECR-104] N82-13011

DENSE PLASMAS
Strongly coupled plasma research for the equation of state and conductivity of a laser-compressed electron-ion plasma
[AD-A105195] N82-12944
Physics of high temperature, dense plasmas
[AD-A105169] N82-12945

DENSITY (MASS/VOLUME)
Prediction of crystal densities of organic explosives by group additivity
[DE81-032016] N82-12249

DENSITY MEASUREMENT
Formulation and characterization of polyimide resilient foams of various densities for aircraft seating applications
[NASA-CR-167421] N82-12230
Density-measurement studies at the BI-GAS pilot plant
[DE82-000910] N82-12262

DENTISTRY
Measurement of gonadal and bone-marrow doses from dental radiography
[ARL/TR-022] N82-12761

DEOXYRIBONUCLEIC ACID
Repair of chemical damage in mammalian cells
[DE81-030823] N82-12757

DEPENDENCE
Society's dependence on information systems
N82-12999

DEPENDENT VARIABLES
Comments on the measurement of linear dependence and feedback between multiple time series by John Geweke
[AD-A104741] N82-12877

DEPOSITION
The stabilization of coal-oil mixtures N82-12237

DEPOSITS
Determination and analysis of jet and missile fuel deposits
[AD-A105458] N82-12248

DESCRIPTIONS
Orienting description of air traffic control in the Netherlands
[VTH-LR-285] N82-12063

DESERTS
Desert sand seas N82-12493

DESIGN ANALYSIS
Transonic airfoil design of full potential flow. 1: Numerical procedure and its computational examples
[NAL-TR-672] N82-12038
Design study report for General Aviation Loran-C receiver
[AD-A104921] N82-12062
Critical requirements for the design of large space structures
[NASA-CR-3484] N82-12131
Designing process wells for an underground coal-gasification environment
[DE81-028434] N82-12284
Interior design for passive solar homes
[DE81-027939] N82-12292

S-Band Shallow Bulk Acoustic Wave (SBAW) microwave source
[NASA-CR-166744] N82-12344
Design analysis of supplemental heating systems
[DE81-030676] N82-12397
Design analysis of supplemental heating systems
[DE82-030677] N82-12398
Extensible bridge-conveyor concepts for coal-mine face haulage
[DE81-031974] N82-12525

DESORPTION
Cryogenic deposition, desorption, and reaction studies of stratospherically relevant species N82-12161
Thermal desorption spectra, equilibrium desorption rates and equilibrium surface coverages of mechanically polished and of sand and bead blasted Inconel 600 surfaces
[EUR-7114-EN] N82-12224
Hydrogen and hydrocarbon absorption and desorption in sensors with transition metal gates on MOS capacitors N82-12331

DESTRUCTIVE TESTS
Application of the Pisces two dimensional ELK program to explosion calculations
[N-40-2815-0] N82-12267

DESULFURIZING
Oxydesulfurization of coal by acidic iron sulfate solutions
[DE82-000464] N82-12199
Development of a process for recovery of valuable components from complex hydrodesulfurization catalysts especially tungsten, molybdenum, vanadium, nickel and cobalt
[BMFT-FB-T-80-186] N82-12204
Hydrodesulfurization of chlorinated coal
[NASA-CASE-NPO-15304-1] N82-12240
Preliminary study: Use of low-sulfur coal and coal cleaning in control of acid rain
[DE81-028930] N82-12675

DETECTION
Multiple arrested synthetic aperture radar N82-12295
Limit on remote FTIR detection of trace gases
[AD-A104842] N82-12511

DETONATION
The transition from deflagration to detonation N82-12380

DEVELOPING NATIONS
Modelling energy-economic interactions in developing countries: A linear-programming approach
[DE81-026048] N82-12637

DEW POINT
Evaluation of a method for short-range forecasting of evaporation duct heights
[AD-A104892] N82-12724

DF LASERS
Remote determination of atmospheric gases with a DF laser
[GKSS-80-E-40] N82-12711

DIAGNOSIS
Compilation of cell data bank for automation in diagnostic cytology
[BMFT-FB-T-80-156] N82-12742
Medical diagnostic application of radiofrequency range electromagnetic waves N82-12746

DIELECTRIC PROPERTIES
Analysis of coaxial EMI feedthrough filters containing ferrite elements
[AD-A105248] N82-12353
The AGCE apparatus N82-12717

DIES
Facing on stamping dies --- testing wear resistance
[CETIM-1.3K.26.2] N82-12460

DIESEL FUELS
Development of catalytic systems for the conversion of syngas to jet fuel and diesel fuel and higher alcohols
[DE82-000087] N82-12255

DIFFERENCE EQUATIONS
Numerical experiments for solving symmetric hyperbolic systems with discontinous initial data N82-12792

DIFFERENTIAL EQUATIONS
Numerical methods for singularly perturbed differential equations with applications
[AD-A105366] N82-12851
Instructive experiments with Runge-Kutta-Rosenbrock methods
[MC-NW-100/81] N82-12856
On the practical value of the notion of BN-stability
[MC-NW-101/81] N82-12857
Application of the Osher-Engquist difference scheme and the full multigrid method to a two dimensional nonlinear elliptic model equation
[MC-NW-103/81] N82-12858
Modified multilag methods for Volterra functional equations
[MC-NW-106/01] N82-12861

DIFFRACTION
Electromagnetic diffraction by a narrow slit in an impedance sheet-E-polarization
[AD-A105029] N82-12144
The uniqueness of phase retrieval from intensity measurements
[AD-A105168] N82-12934

DIFFUSION COEFFICIENT
Transient and diffusion analysis of Hg Cd Te
[NASA-CR-161524] N82-12964

DIFFUSION FLAMES
Chemistry of combustion of fuel-water mixtures
[AD-A105401] N82-12178
Fundamental combustion studies of burning oil-spray flames
[DE81-904248] N82-12186

DIGITAL FILTERS
Efficient structure, and algorithms for digital signal processing N82-12296
On finite word length effects of second order recursive digital filters N82-12334
A design procedure for time-varying digital filters with highly quantized coefficients N82-12336

DIGITAL RADAR SYSTEMS
Real-time multiple-look synthetic aperture radar processor for spacecraft applications
[NASA-CASE-NPO-14054-1] N82-12297

DIGITAL SIMULATION
Mathematical models and digital simulation of hydraulic constant speed drive units for aircraft electrical supply systems, volume 1
[TT-8102-VOL-1] N82-12071
Simulation of a telecommunication distress system --- MARECS satellite
[ESA-CR(P)-1449] N82-12322
Cybernetics and car driving: A mathematical (computer) model for the system to be controlled
[IZF-1980-4] N82-12775

DIGITAL SYSTEMS
Reliability analysis of the F-8 digital fly-by-wire system
[NASA-CR-163110] N82-12079
New approach to speech digitization combining time-domain harmonic scaling and adaptive residual coding
[AD-A105363] N82-12311
Selected area growth for digital integrated circuits and atomic plane doping of gallium arsenide by molecular beam epitaxy N82-12956

DIGITAL TECHNIQUES
Secondary ion mass spectrometric image depth profiling for three-dimensional elemental analysis
[AD-A105092] N82-12172
How a digital computer can tell that a straight line is straight
[AD-A105076] N82-12246
Some aspects of tropical storm structure revealed by handheld-camera photographs from space N82-12507

DIMENSIONAL ANALYSIS
Scaling laws for pulsed chain-reaction chemical lasers
[AD-A104752] N82-12436

DIODES
The history of the development of the rectenna N82-12560

DIPHENYL COMPOUNDS
A study of the phase transitions in benzil by Raman and Brillouin scattering techniques N82-12962

DIRECTIONAL ANTENNAS
Reduction of multipath fading in radio relay links based on the principle of optimum beam scan
[REPT-455-TBR-71] N82-12320

DIRECTIVITY
An interferometer-based phase control system N82-12547
SPS phase control studies N82-12549

DISCRIMINANT ANALYSIS (STATISTICS)
Discrimination rules based on marginal distributions N82-12867

DISPLACEMENT
Shear waves in buildings subjects to seismic loading
[ISSN-0208-5658] N82-12462
Buckling of a thin initially wrinkled rectangular plate
[DE81-029963] N82-12479

DISPLACEMENT MEASUREMENT
Calculations on seismic coupling of underground explosions in salt
[DE81-030633] N82-12706

DISPLAY DEVICES
Electronic Master Monitor and Advisory Display System (EMMADS)
[AD-A105082] N82-12067
Investigation of electrochromic effects for display application
[BMFT-FB-T-80-196] N82-12366
How to display digital SONAR signals. Some primary threshold measurements
[IZF-1979-16] N82-12773
Equipment design must incorporate ease of operation N82-12790
Electro-optical effects in liquid crystals for display use
[BMFT-FB-T-80-200] N82-12961

DISTANCE MEASURING EQUIPMENT
Development of a small opto-electronic distance measuring device
[BMFT-FB-T-80-168] N82-12936

DISTILLATION
Energy conservation in distillation
[DE81-028650] N82-12581

DISTILLATION EQUIPMENT
Control of high purity distillation columns N82-12160

DISTRIBUTED PARAMETER SYSTEMS
Optimal synchronization for a distributed database N82-12791
An operational approach to requirements specification for embedded systems
[AD-A105459] N82-12821
The analysis and synthesis of interconnection networks for distributed computer systems N82-12834
Multicast and synchronization in distributed systems --- algorithms
[CTH-81.2-R] N82-12835
A survey of some problems and recent results for parameter estimation and optimal control in delay and distributed parameter systems
[NASA-CR-16491] N82-12839

DISTRIBUTION FUNCTIONS
Velocity-space synthesis of ISEE-1 measurements of the three dimensional electron distribution function
[NASA-TM-83838] N82-12813

DISTURBING FUNCTIONS
Propagation on finite disturbances in the boundary layer
[MPIS-3/1981] N82-12415

DIURNAL VARIATIONS
Orbital environment dynamics N82-12123
Danish Meteorological Institute, Rude Skov, Geophysical Observatory. Magnetic results
[ISBN-87-7478-187-1] N82-12712

DOCUMENTATION
China report: Science and technology, no. 133
[JPRS-79301] N82-12104
China report: Science and technology, no. 128
[JPRS-79047] N82-12789

DOMAIN WALL
Elastic domain wall waves in ferroelectric ceramics and single crystals
[AD-A105110] N82-12971

DOMESTIC ENERGY
National interim energy-consumption survey: Exploring the variability in energy consumption
[DE81-029910] N82-12589

DOPED CRYSTALS
Nonuniformly doped gallium arsenide microwave power MESFETs N82-12337
Selected area growth for digital integrated circuits and atomic plane doping of gallium arsenide by molecular beam epitaxy N82-12956

DOPPLER EFFECT
Cable-length-measurement system — CHIRP technique and Doppler effect
[DE81-030015] N82-12421

DOSAGE
Measurement of gonadal and bone-marrow doses from dental radiography
[ARL/TR-022] N82-12761

DRAG
Dynamic behavior of particles in spacecraft
N82-12125

DRAG FORCE ANEMOMETERS
A radionuclide counting technique for measuring wind velocity --- drag force anemometers
[NASA-TM-83202] N82-12419

DRAINAGE PATTERNS
Report on Skylab 4 African drought and arid land experiment N82-12501

DRAWING
Molecular orientation in polymers: A study of hot-drawn polymethylmethacrylate N82-12226

DRAWINGS
Using program transformations to derive line-drawing algorithms
[AD-A104873] N82-12817

DROPS (LIQUIDS)
Drop dynamics N82-12113

DROUGHT
Report on Skylab 4 African drought and arid land experiment N82-12501

DRUMS (CONTAINERS)
Paint selection for coating radioactive-waste drums
[DE81-026259] N82-12234

DRYING APPARATUS
Air circuit with heating pump
[BMFT-FB-T-80-188] N82-12404

DUCTILITY
Mechanical properties and hydrogen embrittlement of scandium
[DE81-030745] N82-12221

DUCTS
In-duct viscous flow pressure distribution on a body with boundary layer control
[AD-A105396] N82-12394
Verification of an acoustic transmission matrix analysis of sound propagation in a variable area duct without flow
[NASA-TM-82741] N82-12891
End region and current consolidation effects upon the performance of an MHD channel for the ETF conceptual design
[NASA-TM-82744] N82-12943

DUNES
Desert sand seas N82-12493

DURABILITY
Zipper rear closure endurance testing
[AD-A104732] N82-12785

DYE LASERS
Laser excited Shpol'skii spectroscopy for the selective excitation and determination of polynuclear aromatic hydrocarbons N82-12151

DYNAMIC CHARACTERISTICS
Drop dynamics N82-12113
Generalized study of a hydraulically actuated mechanism system N82-12375
Vibration of cylindrical shells and panels of oval cross-section N82-12466
Glass-mat-reinforced thermoplastic: Strong, easy to work N82-12646

DYNAMIC CONTROL
The dynamics and control of large flexible space structures
[NASA-CR-164982] N82-12096
Dynamic modeling and control structures for a tubular autothermal reactor at an unstable state
N82-12162
Optimal adaptive stochastic control of linear dynamical systems with multiplicative and additive noise N82-12868

DYNAMIC LOADS
Properties of confined concrete subjected to static and dynamic loads N82-12468
A critical void growth failure criterion developed for dynamic and static loading conditions N82-12469

DYNAMIC PROGRAMMING
Dynamic programming for problems of impulse control N82-12806
Minimizing computational cost for dynamic programming algorithms
[AD-A104792] N82-12818

DYNAMIC RESPONSE
Evaluation and wind tunnel tests of the 4,000 lb (normal-force) pitch/yaw and roll dynamic stability balance systems for measuring direct, cross, and cross-coupling derivatives
[AD-A105122] N82-12047
Identification of the adaptive feedback of the human motor system using the response difference method
N82-12754
User's guide to BIODYN-80: An interactive software package for modeling biodynamic feedthrough to a pilot's hands, head and eyes
[AD-A104933] N82-12786
Deep anistropic shell program for tire analysis
[NASA-CR-3483] N82-12845

DYNAMIC STABILITY
Effects of aerodynamic coupling on the dynamics of roll aircraft N82-12070
Spacecraft dynamic environments N82-12122
Design of the space shuttle digital autopilot and resulting dynamic environment N82-12126

DYNAMIC STRUCTURAL ANALYSIS
Space Construction Experiment Definition Study (SCEDS), part 1. Volume 1: Executive summary
[NASA-CR-167458] N82-12094
Space Construction Experiment Definition Study (SCEDS), part 1. Volume 2: Study results
[NASA-CR-167432] N82-12095
The dynamics and control of large flexible space structures
[NASA-CR-164982] N82-12096
Formulation of a dynamic analysis method for a generic family of hoop-mast antenna systems
[NASA-CR-164981] N82-12300
Shear waves in buildings subjects to seismic loading
[ISSN-0208-5658] N82-12462

DYNAMIC TESTS
Fault testing and diagnosis implementation in microprocessor controlled data networks
[ESNT-D-81001] N82-12836

E

EARTH ATMOSPHERE
The Numerical Studies Program for the Atmospheric General Circulation Experiment (AGCE) for Spacelab Flights
[NASA-CP-2200] N82-12715
Preliminary regime diagram on a sphere with a simplified general circulation model N82-12723

EARTH CRUST
Synthesis of regional crust and upper-mantle structure from seismic and gravity data
[NASA-CR-165001] N82-12696

EARTH MOVEMENTS
Modelling of soil-structure interaction by finite and infinite elements
[PB81-229270] N82-12287
NASA geodynamics program
[NASA-TM-84010] N82-12697

EARTH OBSERVATIONS (FROM SPACE)
Skylab explores the Earth
[NASA-SP-380] N82-12492

EARTH PLANETARY STRUCTURE
Global Tectonics: Some Geologic analyses of observations and photographs from Skylab
N82-12494
Determination of crustal Q structure from multi-mode surface waves N82-12682
Synthesis of regional crust and upper-mantle structure from seismic and gravity data
[NASA-CR-165001] N82-12696

EARTH RADIATION BUDGET EXPERIMENT
Radiation budget measurement/model interface research
[NASA-CR-165000] N82-12699

EARTH RESOURCES
Maritime support for ocean-resources development
[AD-A104730] N82-12735

EARTH TERMINALS
An evaluation of the performance of 12 GHz low cost TVRO terminals in northwestern Ontario --- ground terminals for ANIK B
[CRC-1345] N82-12299

EARTHQUAKE DAMAGE
Inelastic finite strain analysis of structural metals subjected to nonproportional loadings N82-12471

EARTHQUAKES
Earthquakes in the United States, July - September 1979
[USGS-CIRC-836-C] N82-12690
Earthquakes in the United States, January - March 1979
[CIRC-836-A] N82-12691
On the geodetic stability of the Goddard Optical Research Facility
[NASA-TM-82175] N82-12692
Seismic Engineering Program Report, September - December 1979
[USGS-CIRC-818-C] N82-12694

ECONOMETRICS
Models for forecasting energy use in the US farm sector
[DE81-904220] N82-12580

ECONOMIC ANALYSIS
Transportation systems evaluation methodology development and applications, phase 3
[NASA-CR-164999] N82-12051
Photovoltaic market analysis program: Background, model development, applications and extensions
[DE81-029711] N82-12609
Near-term improvements in parabolic troughs: An economic and performance assessment
[DE82-001158] N82-12615
Economic implications of passive-solar retrofit for single-family residences in Albuquerque, New Mexico: A case study
[DE81-028402] N82-12630
DOE small-hydropower demonstration program
[DE81-027819] N82-12636

ECONOMIC DEVELOPMENT
MASEC industrial fuel-wood program
[DE82-000461] N82-12595
Project impact analysis as an optimal control problem — irrigation and hydroelectric power project
[DE81-028465] N82-12842
Information in society N82-12993

ECONOMIC FACTORS
Modelling energy-economic interactions in developing countries: A linear-programming approach
[DE81-026048] N82-12637

ECONOMIC IMPACT
Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 1: Energy-conserving design for residential structures
[DE82-900206] N82-12278
Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 2: Domestic hot water systems
[DE82-900207] N82-12279
Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 3: Customer load management systems
[DE82-900208] N82-12280
Project impact analysis as an optimal control problem — irrigation and hydroelectric power project
[DE81-028465] N82-12842
Overall economic impact of an operational Meteosat system
[ESA-CR(P)-1457] N82-13010

ECONOMY
Project impact analysis as an optimal control problem — irrigation and hydroelectric power project
[DE81-028465] N82-12842

ECOSYSTEMS
Modeling as a tool — in biology
[PUBL-252] N82-12488
Peat deposits of Dismal Swamp pocosins: Camden, Currituck, Gates, Pasquotank, and Perquimans Counties, North Carolina
[DE81-029642] N82-12524
Environmenal pollutant studies, FY 1980
[DE81-029051] N82-12666
Biogeochemical studies of technetium in marine and estuarine ecosystems
[DE81-030325] N82-12672

ECUADOR
Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Fernandian Caldera, Galapagos Islands, Ecuador N82-12496

EDGE DISLOCATIONS
Fatigue phenomena in copper
[RISO-M2241] N82-12225

EDGES

Self-sustained oscillations of a mixing layer. Edge system N82-12374

EDUCATION

Vocational-Technical Instructors Passive-Solar Training Workshop
[DE81-030066] N82-12622

EDUCATIONAL TELEVISION

An evaluation of the performance of 12 GHz low cost TVRO terminals in northwestern Ontario --- ground terminals for ANIK B
[CRC-1345] N82-12299

EFFICIENCY

Rectenna session: Micro aspects N82-12582

Session on solid state: Introduction N82-12585

Modified reference SPS with solid state transmitting antenna N82-12586

Analysis of Richardson iteration in multigrid methods for nonlinear parabolic differential equations
[MC-NW-105/81] N82-12859

EFFLUENTS

Production of ammonia in a packed-bed, anaerobic upflow (ANFLOW) bioreactor
[DE81-030699] N82-12619

Environmental control technology for coal cleaning wastes
[DE81-025331] N82-12676

EFFUSIVES

Mount St. Helens volcanic-ash fall in the Bull Run watershed, Oregon, March - June 1980
[USGS-CIRC-850-A] N82-12688

EIGENVALUES

On finite word length effects of second order recursive digital filters N82-12334

Comparison of results between the ballooning modes codes BLOON and BALOON
[DE81-030259] N82-12949

ELASTIC BODIES

Elastic body dynamics N82-12128

ELASTIC CYLINDERS

The response and the lift force analysis of a cylinder oscillating in still water N82-12464

ELASTIC DEFORMATION

Molecular orientation in polymers: A study of hot-drawn polymethylmethacrylate N82-12226

Theory of thermoelasticity
[NASA-TM-75510] N82-12473

ELASTIC PLATES

Buckling of a thin initially wrinkled rectangular plate
[DE81-029963] N82-12479

ELASTIC PROPERTIES

A phenomenological theory for predicting the temperature dependence of elastic compliance in simple proper ferroelectric tungstenbronzes
N82-12214

Elastic-plastic thick-walled tubes subjected to internal pressure and temperature gradient
[AD-A105243] N82-12477

ELASTIC SCATTERING

Nuclear structure studies by the scattering of medium-energy electrons
[DE81-030056] N82-12905

Inclusive proton spectra and total reaction cross sections for proton-nucleus scattering at 800 MeV
[DE81-030505] N82-12906

ELASTIC WAVES

Elastic domain wall waves in ferroelectric ceramics and single crystals
[AD-A105110] N82-12971

ELASTODYNAMICS

Elastic body dynamics N82-12128

ELASTOHYDRODYNAMICS

Emission spectra from EHD contacts N82-12465

ELASTOMERS

The effect of pressure on the physical and mechanical properties of Solithane 113 elastomer
N82-12229

W76 elastomers/propellant compatibility
[DE81-031933] N82-12258

Compression stress relaxation testing for determining the performance of elastomeric fluid shells N82-12459

ELECTRIC BATTERIES

Performance of advanced chromium electrodes for the NASA Redox Energy Storage System
[NASA-TM-82724] N82-12574

Electrolytes for rechargeable lithium batteries
[AD-A105230] N82-12577

ELECTRIC CONTACTS

Structure: Property relationships in gold based sliding electrical contact materials N82-12210

ELECTRIC CONTROL

Advanced electrofluidic servovalve development
[AD-A105172] N82-12361

ELECTRIC CURRENT

Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 3: Customer load management systems
[DE82-900206] N82-12280

The effect of optically enhanced leakage current on S-band TRAPATT diode oscillators N82-12342

The magnetostatic force produced by current loops and is medical applications N82-12748

ELECTRIC DISCHARGES

Electrochemical models for the discharge characteristics of the nickel cadmium cell
[NASA-TM-83614] N82-12569

Threshold criteria for a space simulation beam-plasma-discharge
[AD-A104937] N82-12946

ELECTRIC EQUIPMENT

Voltage test facility for defence standard 61-5
[NGTE-M-80112(L)] N82-12370

ELECTRIC FIELDS

The gravity wave in a liquid with a surface film, in the presence of an applied electric field
[REPT-80-2] N82-12406

ELECTRIC FILTERS

Analysis of coaxial EMI feedthrough filters containing ferrite elements
[AD-A105246] N82-12353

Extracted-pole filter multiplexion and asymetric double array network synthesis
[ESA-CR(P)-1453] N82-12371

ELECTRIC GENERATORS

Security assessment of power systems including energy storage and with the integration of wind energy
[DE81-030166] N82-12590

Economic assessment of advanced central-receiver solar-thermal power systems: Executive summary
[DOE/SF-10801/0] N82-12624

ELECTRIC HYBRID VEHICLES

Electric and hybrid vehicles environmental control subsystem study
[NASA-CR-164995] N82-12657

Electric and hybrid vehicle environmental control subsystem study
[NASA-CR-164996] N82-12658

Method for estimating technological penetration rates in commercial automobile fleets
[DE82-000433] N82-13015

ELECTRIC MOTOR VEHICLES

Design study of a continuously variable roller cone traction CVT for electric vehicles
[NASA-CR-159841] N82-12445

Galvanic high energy cells with molten salt electrolytes --- electric vehicle propulsion
[BMFT-FB-T-81-048] N82-12643

Method for estimating technological penetration rates in commercial automobile fleets
[DE82-000433] N82-13015

ELECTRIC MOTORS

A simplified power factor controller with increased energy saving circuit
[NASA-CASE-MFS-25323-1] N82-12349

ELECTRIC NETWORKS

Assignment techniques for heavily loaded networks
[A-79-VK-45-07] N82-12988

ELECTRIC POTENTIAL

Voltage test facility for defence standard 61-5
[NGTE-M-80112(L)] N82-12370

Voltage losses and reconditioning of NICd cells: Behavior during cycling
[AD-A105418] N82-12575

Method and apparatus for detecting coliform organisms
[NASA-CASE-ARC-11322-1] N82-12739

ELECTRIC POWER

Models for forecasting energy use in the US farm sector
[DE81-904220] N82-12580

ELECTRIC POWER PLANTS

Magnetohydrodynamics (MHD) Engineering Test Facility (ETF) 200 MWe power plant. Design Requirements Document (DRD)
[NASA-TM-82705] N82-12446

Assessment of rotor-bearing dynamics: A planning study for the utility industry
[DE81-904242] N82-12451

Geothermal reservoir assessment: Northern basin and range province Stillwater prospect, Churchill County, Nevada
[DE82-000529] N82-12516

Magnetohydrodynamics (MHD) Engineering Test Facility (ETF) 200 MWe power plant. Conceptual Design Engineering Report (CDER). Volume 1: Executive summary
[NASA-CR-165452-VOL-1] N82-12570

Security assessment of power systems including energy storage and with the integration of wind energy
[DE81-030166] N82-12590

Investigation and research of specific combustion-turbine and combined-cycle field problems
[DE81-904231] N82-12592

Comparative economics of solar thermal central receivers
[DE81-029623] N82-12601

Solar thermal central receivers for industrial process heat generation: User views and recommendations for commercialization
[DE81-029611] N82-12618

Solar project at Almeria nears completion
N82-12647

A computer simulation modeling study to predict air quality impacts from a 500 MW coal-fired power plant N82-12650

ELECTRIC POWER SUPPLIES

Mathematical models and digital simulation of hydraulic constant speed drive units for aircraft electrical supply systems, volume 1
[TT-8102-VOL-1] N82-12071

Upgrading the intense neutron source high voltage power supply
[DE81-026970] N82-12364

Innovative equipment for small-scale hydro developments
[DE81-027820] N82-12634

ELECTRIC POWER TRANSMISSION

Application of Kalman filtering in computer relaying of power systems N82-12336

ELECTRIC PROPULSION

Galvanic high energy cells with molten salt electrolytes --- electric vehicle propulsion
[BMFT-FB-T-81-048] N82-12643

ELECTRIC RELAYS

Application of Kalman filtering in computer relaying of power systems N82-12336

ELECTRIC STIMULI

Transcutaneous electrical peripheral nerve stimulation: Implications for neural control mechanisms N82-12749

ELECTRIC WIRE

Phase sensitive guidance sensor for wire-following vehicles
[NASA-CASE-NPO-15341-1] N82-12346

Superconductivity in Th-Nb composites
[DE81-030746] N82-12363

ELECTRICAL IMPEDANCE

Impedance and mass transport kinetics of nickel cadmium cells
[AD-A105320] N82-12576

ELECTRICAL PROPERTIES

Structure: Property relationships in gold based sliding electrical contact materials N82-12210

Nonuniformly doped gallium arsenide microwave power MESFETs N82-12337

ELECTRICAL RESISTANCE

Silicon-on-sapphire medium power MESFET
[AD-A105378] N82-12352

Impurity resistance in ferromagnetic metals
N82-12963

ELECTRICAL RESISTIVITY

Toward an understanding of the turbulent electrode effect over land
[AD-A104902] N82-12700

Strongly coupled plasma research for the equation of state and conductivity of a laser-compressed electron-ion plasma
[AD-A105195] N82-12944

Analysis of the temperature dependence of resistivity in N-type silicon
[AD-A105192] N82-12976

ELECTRO-OPTICAL EFFECT
Electro-optical effects in liquid crystals for display use
[BMFT-FB-T-80-200] N82-12981

ELECTRO-OPTICS
Anisotropic and electro-optical effects in liquid crystals
[AD-A105189] N82-12936
Development of a small opto-electronic distance measuring device
[BMFT-FB-T-80-168] N82-12938

ELECTROACOUSTIC WAVES
Nonlinear interaction of sound waves in water: Experiments with parametric arrays
[PHL-1979-44] N82-12897

ELECTROCATALYSTS
Electrocatalysis at oxide-covered metal electrodes
[DE81-027650] N82-12202
Preparation and evaluation of advanced electrocatalysts for phosphoric acid fuel cells
[NASA-CR-165519] N82-12573
Energy savings by means of fuel-cell electrodes in electro-chemical industries
[DE81-030975] N82-12582

ELECTROCHEMICAL CELLS
Electrochemical models for the discharge characteristics of the nickel cadmium cell
[NASA-TM-83614] N82-12569

ELECTROCHEMISTRY
Electrocatalysis at oxide-covered metal electrodes
[DE81-027650] N82-12202

ELECTRODEPOSITION
Deposition of particles in vertical conduits due to electrostatic charge, diffusion, and gravity
N82-12377

ELECTRODES
Electrocatalysis at oxide-covered metal electrodes
[DE81-027650] N82-12202
X-ray emission of high voltage vacuum devices
N82-12348
Performance of advanced chromium electrodes for the NASA Redox Energy Storage System
[NASA-TM-82724] N82-12574
Energy savings by means of fuel-cell electrodes in electro-chemical industries
[DE81-030975] N82-12582

ELECTROLYSIS
A pulse-forming network for particle path visualization — at Ames Aeromechanics Water Tunnel Facility
[NASA-TM-81311] N82-12036
Behavior of alkali metal-acid phosphates during elevated temperature water electrolysis
[DE82-000243] N82-12181

ELECTROLYTES
Correlation and prediction of vapor-liquid equilibrium in electrolytic solutions N82-12157
Electrolytes for rechargeable lithium batteries
[AD-A105230] N82-12577

ELECTROMAGNETIC ABSORPTION
Radiative heat transfer in emitting, absorbing and anisotropically scattering particulate clouds
N82-12372
A theoretical study of microwave beam absorption by a rectenna N82-12563

ELECTROMAGNETIC FIELDS
The method of Frieman and Kroll for the calculation of electromagnetic fields and its application to data inversion
[AD-A104809] N82-12315

ELECTROMAGNETIC INTERFERENCE
Measurement of pair-quasiparticle interference in Josephson tunnel junctions
[AD-A105251] N82-12972

ELECTROMAGNETIC MEASUREMENT
Nuclear structure studies by the scattering of medium-energy electrons
[DE81-030068] N82-12905

ELECTROMAGNETIC PULSES
An advanced 500-MHZ-bandwidth fiber-optic signal link for EMP and general laboratory applications
[AD-A105118] N82-12314

ELECTROMAGNETIC RADIATION
Medical diagnostic application of radiofrequency range electromagnetic waves N82-12746

ELECTROMAGNETIC SCATTERING
Multiple electromagnetic scattering from a cluster of spheres. Volume 1: Theory
[AD-A106453] N82-12310
Radiative heat transfer in emitting, absorbing and anisotropically scattering particulate clouds
N82-12372

ELECTROMAGNETIC SHIELDING
Electromagnetic diffraction by a narrow slit in an impedance sheet-E-polarization
[AD-A105029] N82-12144

ELECTROMAGNETIC WAVE TRANSMISSION
The 94GHz propagation facility at the Ypenburg airfield and the first experimental results — attenuation
[PHL-1979-34] N82-12325
Analysis of coaxial EMI feedthrough filters containing ferrite elements
[AD-A105248] N82-12353

ELECTRON ACCELERATORS
Experiments with waves on relativistic electron beams
[AD-A105094] N82-12918

ELECTRON BEAMS
Threshold criteria for a space simulation beam-plasma-discharge
[AD-A104937] N82-12946

ELECTRON CYCLOTRON HEATING
Electron cyclotron damping for large wave amplitude in Tokamak plasmas
[EUR-CEA-FC-1053] N82-12948

ELECTRON DENSITY (CONCENTRATION)
Ionospheric propagation correction modeling for satellite altimeters
[NASA-CR-156881] N82-12447
ECR discharge cleaning experiment in the JIPP T-11
[IPPJ-539] N82-12940

ELECTRON DENSITY PROFILES
Threshold criteria for a space simulation beam-plasma-discharge
[AD-A104937] N82-12946
Using spectral line profiles as a diagnostic of the plasma electron density
[DE81-030313] N82-12952

ELECTRON DISTRIBUTION
Velocity-space synthesis of ISEE-1 measurements of the three dimensional electron distribution function
[NASA-TM-83838] N82-12813

ELECTRON ENERGY
Bremsstrahlung energy spectra from electrons of kinetic energy 1 keV less than or equal to T less than or equal to 2000 keV incident on neutral atoms 1 less then or equal to Z less than or equal to 92
[DE81-030984] N82-12902

ELECTRON GUNS
ORELA electron guns
[DE81-030703] N82-12923

ELECTRON MICROSCOPES
Automation of a specimen stage in an electron microphobe
[DE81-030691] N82-12422

ELECTRON MICROSCOPY
Preparation and evaluation of advanced electrocatalysts for phosphoric acid fuel cells
[NASA-CR-165519] N82-12573

ELECTRON PLASMA
Strongly coupled plasma research for the equation of state and conductivity of a laser-compressed electron-ion plasma
[AD-A105195] N82-12944

ELECTRON SCATTERING
Nuclear structure studies by the scattering of medium-energy electrons
[DE81-030068] N82-12905

ELECTRON SPECTROSCOPY
Time-of-flight spectroscopy of molecular structure, collision processes and gas-surface interactions
[AD-A105436] N82-12898
Electron field emission tunneling spectroscopy of platinum group and tungsten metals in the presence of molecular gas and noble metal adsorbates
N82-12967

ELECTRON TRAJECTORIES
Electrostatic lenses of the antisymmetric quadrupole and symmetric octupole quadruplet N82-12343

ELECTRON TUBES
Tubular electrodes in flow injection analysis
N82-12149
Study of the emission performance of high-power klystrons: SLAC XK-5
[DE81-030177] N82-12362

ELECTRONIC EQUIPMENT
Hardware survey for the avionics test bed
[NASA-CR-161072] N82-12798
Patent licensing contracts in the electronic industry — Denmark
[ECR-104] N82-13011

ELECTROSTATIC CHARGE
Electrostatic lenses of the antisymmetric quadrupole and symmetric octupole quadruplet N82-12343
Deposition of particles in vertical conduits due to electrostatic charge, diffusion, and gravity
N82-12377

ELECTROSTATICS
Test progress on the electrostatic membrane reflector
[NASA-CR-165792] N82-12472

ELEMENTARY PARTICLE INTERACTIONS
Application and description of the interacting Boson Model N82-12914

ELLIPTIC FUNCTIONS
Application of the Osher-Engquist difference scheme and the full multigrid method to a two dimensional nonlinear elliptic model equation
[MC-NW-103/81] N82-12858

ELUTION
Fundamental studies in continuous annular chromatography
[DE82-000519] N82-12190

EMERGENCIES
An investigation into pilot and system response to critical in-flight events. Volume 1: Executive summary
[NASA-CR-164993] N82-12782
An investigation into pilot and system response to critical in-flight events. Volume 2: Appendix
[NASA-CR-164994] N82-12783
An approach to the management of hazardous materials
[AD-A104869] N82-12987

EMISSION SPECTRA
Synchronous fluorescence/matrix isolation method for trace organic analysis
[DE81-030958] N82-12193
Emission spectra from EHD contacts N82-12465
Integrated fluxes for emission lines in the ultraviolet spectra of several planetaries
[NASA-CR-164986] N82-13022

ENCAPSULATING
Testing of solar cell covers and encapsulants conducted in a simulated space environment
[NASA-CR-165475] N82-12571
Method and system for nuclear waste disposal — control valves for encapsulating wastes
[NASA-CASE-NPO-15454-1] N82-12916

ENERGY ABSORPTION
Simple-power-balance model for microwave heating in EBT
[DE81-030428] N82-12953

ENERGY CONSERVATION
Energy efficiency buildings program
[DE81-028050] N82-12276
Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 1: Energy-conserving design for residential structures
[DE82-900206] N82-12278
A simplified power factor controller with increased energy saving circuit
[NASA-CASE-MFS-25323-1] N82-12349
Air circuit with heating pump
[BMFT-FB-T-80-188] N82-12404
Passive solar technical planning study
[EPRI-EM-1591] N82-12578
Energy savings by means of fuel-cell electrodes in electro-chemical industries
[DE81-030975] N82-12582
Utilization of waste heat from major transformer substations. Volume 1: Generic study
[DE81-904212] N82-12593
Utilization of waste heat from major transformer substations. Volume 2: Site-specific study
[DE81-904236] N82-12594
Passive-solar-retrofit study for the United States Navy
[DE81-028921] N82-12629
DOE small-hydropower demonstration program
[DE81-027819] N82-12636

Fuel savings in hot water heating plants by application of heat pumps operated with natural gas (natural gas heat pump). Project: gas engine [BMFT-FB-T-80-125] N82-12641
Energy technologies and the environment. Environmental information handbook [DE81-029809] N82-12660
Analysis of integrated fuel-efficient, low-noise procedures in terminal-area operations [DE81-029833] N82-13014
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 1: Summary [PB81-219479] N82-13018
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 2: Appendices A through C [PB81-219487] N82-13019
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 3: Appendix D [PB81-219495] N82-13020

ENERGY CONSUMPTION
Energy conservation in distillation [DE81-029850] N82-12581
National interim energy-consumption survey: Exploring the variability in energy consumption [DE81-029910] N82-12589
Guidebook for solar process-heat applications [DE81-027977] N82-12598

ENERGY CONVERSION
Conversion of municipal solid waste to energy, Jacksonville, Florida, phase 1 [DE82-000806] N82-12613

ENERGY CONVERSION EFFICIENCY
Fuel nitrogen conversion during fuel rich combustion of pulverized coal and char N82-12156
Industrial application of fluidized-bed combustion [DE81-030272] N82-12182
Intermediate photovoltaic system application experiment operational performance: Executive summary. Volume 1: For Newman Power Station, El Paso, Texas [DE81-031934] N82-12602
Innovative equipment for small-scale hydro developments [DE81-027820] N82-12634
Basis for research proposals concerning (industrial) solar energy production processes derived from biological principles N82-12640

ENERGY DISSIPATION
Energy dissipation in Exosat tanks: Test results [CNES-NT-99] N82-12103

ENERGY LEVELS
Nuclear structure study at intermediate energies [DE81-030156] N82-12911

ENERGY POLICY
Coal combustion in high convective flows [DE81-030391] N82-12194
Catalytic hydrogenation of coal-derived liquids [DE81-030465] N82-12198
Supercritical multicomponent solvent coal extraction [NASA-CASE-NPO-15767-1] N82-12241
Selective separation of coal feedstocks for conversion by magnetic separation techniques [DE81-028060] N82-12263
Assessment of potential future markets for the production of hydrogen from water [BMFT-FB-T-81-012] N82-12266
Energy: A continuing bibliography with indexes [NASA-SP-7043(30)] N82-12536
Performance of advanced chromium electrodes for the NASA Redox Energy Storage System [NASA-TM-82724] N82-12574
The severity of institutional barriers affecting energy-from-municipal-waste technologies [DE82-000133] N82-12583
Bibliography of the seasonal thermal energy storage library [DE81-030470] N82-12586
Utilization of waste heat from major transformer substations. Volume 1: Generic study [DE81-904212] N82-12593
Utilization of waste heat from major transformer substations. Volume 2: Site-specific study [DE81-904236] N82-12594
Application of different KFA-models in the framework of the energy research programme of the European Communities [EUR-6758-EN] N82-12597
Photovoltaic market analysis program: Background, model development, applications and extensions [DE81-029711] N82-12609
The properties of solar and heat pump heating systems of small houses and additional heat sources [VTT-56] N82-12644
Energy technologies and the environment. Environmental information handbook [DE81-029809] N82-12660
Impact of fuel-economy shortfall: Trends in technology-weighted EPA versus on-road MPG. Periodic analysis memorandum no. 1 [DE81-030841] N82-12667
Low-level radioactive waste: An introductory overview [DE81-026334] N82-12924

ENERGY REQUIREMENTS
Comparison of residential window distributions and effects of mass and insulation [DE81-027938] N82-12283
Models for forecasting energy use in the US farm sector [DE81-904220] N82-12580
Performance analysis of 11 Denver Metro passive homes [DE81-025473] N82-12626
Technology characterizations: Environmental information handbook, second edition [DE81-029993] N82-12671

ENERGY SOURCES
Analysis report: Applied analysis model summaries [DE81-029278] N82-12526

ENERGY SPECTRA
Bremsstrahlung energy spectra from electrons of kinetic energy 1 keV less than or equal to T less than or equal to 2000 keV incident on neutral atoms 1 less than or equal to Z less than or equal to 92 [DE81-030984] N82-12902
On the nature of the cosmic ray positron spectrum [NASA-TM-83834] N82-13041

ENERGY STORAGE
Study of ATES thermal behavior using a steady flow model [DE81-030683] N82-12396
Performance of advanced chromium electrodes for the NASA Redox Energy Storage System [NASA-TM-82724] N82-12574
Bibliography of the seasonal thermal energy storage library [DE81-030470] N82-12586
Security assessment of power systems including energy storage and with the integration of wind energy [DE81-030166] N82-12590
Comparative economic performance of selected passive solar heating and cooling technologies [DE81-030220] N82-12600

ENERGY TECHNOLOGY
Energy: A continuing bibliography with indexes [NASA-SP-7043(30)] N82-12536
Department of Energy projects [DE82-000036] N82-12579
The severity of institutional barriers affecting energy-from-municipal-waste technologies [DE82-000133] N82-12583
Status of solar energy research and development in Australia [NP-1903916] N82-12611
Conversion of municipal solid waste to energy, Jacksonville, Florida, phase 1 [DE82-000806] N82-12613
Performance analysis of 11 Denver Metro passive homes [DE81-025473] N82-12626
Modelling energy-economic interactions in developing countries: A linear-programming approach [DE81-026046] N82-12637
West Europe report: Science and technology, no. 72 — composite materials and energy technology [JPRS-78676] N82-12645
Technology characterizations: Environmental information handbook, second edition [DE81-029993] N82-12671

ENGINE DESIGN
Test results and facility description for a 40-kilowatt stirling engine [NASA-TM-82620] N82-13013
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 1: Summary [PB81-219479] N82-13018
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 2: Appendices A through C [PB81-219487] N82-13019
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 3: Appendix D [PB81-219495] N82-13020

ENGINE INLETS
Effect of a part span variable inlet guide vane on TF34 fan performance [NASA-CR-165456] N82-12075

ENGINE TESTS
Evaluation of shale oil as a utility gas-turbine fuel [DE81-904234] N82-12251

ENGINES
Evaluation of shale oil as a utility gas-turbine fuel [DE81-904234] N82-12251

ENVIRONMENT EFFECTS
Transportation systems evaluation methodology development and applications, phase 3 [NASA-CR-164999] N82-12051
Fracture mechanisms of sensitized stainless steels in sulfur-containing environments [DE81-026052] N82-12482
Assessment of the potential of coal-fueled heat engines in total and integrated energy systems [DE82-000169] N82-12587
Technology assessment of solar energy systems: Residential use of fuelwood in the Pacific Northwest [DE82-000046] N82-12603
Modular hydro dam approach to the economic development of ultra low-head hydropower [DE81-027817] N82-12635
Solid waste disposal practices: Open dumps not identified. States face funding problems [CED-81-131] N82-12653
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic fuels production [DE81-030822] N82-12661
Technology characterizations: Environmental information handbook, second edition [DE81-029993] N82-12671
Overview of the biomedical and environmental programs at the Oak Ridge National Laboratory [DE81-027964] N82-12765

ENVIRONMENT MANAGEMENT
Energy technologies and the environment. Environmental information handbook [DE81-029809] N82-12660
Technology characterizations: Environmental information handbook, second edition [DE81-029993] N82-12671

ENVIRONMENT MODELS
Modeling as a tool — in biology [PUBL-252] N82-12488

ENVIRONMENT PROTECTION
New building materials. A contribution to environmental protection. Subproject: Fly ash cement [BMFT-FB-T-80-176] N82-12285
Feasibility analysis of trench strip and auger mining [DE81-027557] N82-12521
Application of different KFA-models in the framework of the energy research programme of the European Communities [EUR-6758-EN] N82-12597
Wet air oxidation of waste water [BMFT-FB-T-80-132] N82-13016

ENVIRONMENTAL CONTROL
Electric and hybrid vehicles environmental control subsystem study [NASA-CR-164995] N82-12657
Electric and hybrid vehicle environmental control subsystem study [NASA-CR-164996] N82-12658

ENVIRONMENTAL MONITORING
Snow-mapping experiment N82-12498
Quantitative analysis of atmospheric pollution phenomena N82-12505

Development of a marine monitoring program in California N82-12649

Environmental data for sites in the National Solar Data Network
[DE82-000071] N82-12707

Monitor for detecting nuclear waste leakage in a subsurface repository
[DE81-026429] N82-12927

ENVIRONMENTAL SURVEYS

Hydrogeochemical and stream sediment reconnaissance basic data for Harrison Bay Quadrangle, Alaska
[DE81-026352] N82-12530

ENVIRONMENTAL TESTS

Simulation of the thermal behavior of an object and its nearby surroundings
[PHL-1980-06] N82-12863

ENZYME ACTIVITY

Partial acid hydrolysis pretreatment for enzymatic hydrolysis of cellulose: A process development study of ethanol production N82-12236

EPITAXY

Silicon transport epitaxy — low temperature epitaxial process
[BMFT-FB-T-80-165] N82-12980

EQUALIZERS (CIRCUITS)

Microwave transversal equalizer. Open loop adaptive computer control techniques
[AD-A105005] N82-12356

EQUATIONS OF STATE

Singular perturbation modeling and its application to fast algorithms of Chandrasekhar type N82-12810

Strongly coupled plasma research for the equation of state and conductivity of a laser-compressed electron-ion plasma
[AD-A105195] N82-12944

Development of a thermodynamic properties correlation framework for the coal conversion industry, phase 1A
[DE81-030363] N82-12985

Instanton effects in the equation of state for dense neutron star matter
[HU-TFT-79-19] N82-13023

EQUATORIAL ATMOSPHERE

On the global circulation and the hurricane system of the Jovian atmosphere
[NASA-TM-83833] N82-13034

ERROR ANALYSIS

Hydrologic studies support, INTERCOMP code conversion
[DE81-030318] N82-12515

Error propagation and elimination in computer programs
[AD-A105437] N82-12822

An error estimate for the H exp (-1) Galerkin method for a parabolic with non-smooth initial data
[CTH-MATH-1981-11] N82-12854

Error propagation in the gravity model N82-12869

ERROR DETECTION CODES

Instrument failure detection for a linear uncertain system N82-12073

Fault testing and diagnosis implementation in microprocessor controlled data networks
[ESNT-D-81001] N82-12836

ERYTHROCYTES

Studies in erythropoiesis: The influence of the glycocalyx of the red cell membrane
[DE81-030666] N82-12760

ESCHERICHIA

Method and apparatus for detecting coliform organisms
[NASA-CASE-ARC-11322-1] N82-12739

ESTIMATING

Autoregressive spectral estimation, log spectral smoothing and entropy
[AD-A104940] N82-12849

Variances for adaptive trimmed means
[AD-A104913] N82-12876

On some numerical properties of ARMA parameter estimation procedures
[AD-A104938] N82-12879

ESTUARIES

Development of a marine monitoring program in California N82-12649

ETCHANTS

Further investigation of etchants for chemically polishing SC-Cut quartz crystals
[AD-A104903] N82-12973

ETCHING

Liquid immersion apparatus for minute articles
[NASA-CASE-MFS-25363-1] N82-12441

ETHYL ALCOHOL

Fermentation kinetics and process development for enhanced rate of production of ethanol from carbohydrates N82-12155

Correlation and prediction of vapor-liquid equilibrium in electrolytic solutions N82-12157

Partial acid hydrolysis pretreatment for enzymatic hydrolysis of cellulose: A process development study of ethanol production N82-12236

Project for reliability fleet testing of alcohol/gasoline blends
[DE82-000004] N82-12250

Ethanol production via fungal decomposition and fermentation of biomass, phase 2
[DE82-000104] N82-12256

Ethanol production via fungal decomposition and fermentation of biomass
[DE82-000103] N82-12257

ETHYL COMPOUNDS

Impact of energy-related pollutants on chromosome structure
[DE82-000153] N82-12670

EUROPE

West Europe report: Science and technology, no. 72 — composite materials and energy technology
[JPRS-78876] N82-12645

EUTECTIC ALLOYS

Structure: Property relationships in gold based sliding electrical contact materials N82-12210

Gravitational influence on binary alloy melt equilibria and eutectic solidification N82-12215

Superconductivity in Th-Nb composites
[DE81-030746] N82-12363

EUTECTIC COMPOSITES

A search for new fuel components in explosive mixtures with ammonium nitrate
[AD-A104881] N82-12245

EUTECTICS

Metals and ceramics division materials science program
[DE81-030697] N82-12137

Field emission cold cathode devices based on eutectic systems
[AD-A104795] N82-12357

EVAPORATION

Evaluation of a method for short-range forecasting of evaporation duct heights
[AD-A104892] N82-12724

EVAPORATORS

Feasibility study on the fabrication of longitudinally welded heat exchanger tubes for sea water desalination plants on a factory ship
[BMFT-FB-M-80-004] N82-12453

EVOLUTION (DEVELOPMENT)

The Universe: Past and present reflections — big bang theory
[PREPRINT-70] N82-13032

Structure and origin of cometary nuclei
[NASA-TM-83823] N82-13035

EXCIMER LASERS

Laser excited Shpol'skii spectroscopy for the selective excitation and determination of polynuclear aromatic hydrocarbons N82-12151

EXCITATION

Synchronous fluorescence/matrix isolation method for trace organic analysis
[DE81-030958] N82-12193

EXCRETION

Sweating responses of men and women during exercise in humid and dry heat N82-12745

EXHAUST EMISSION

Combustion and emission characteristics of a model gas turbine combustor burning lean heterogeneous mixtures — effect of degree of atomizing
[NAL-TR-666] N82-12171

AGT-102 automotive gas turbine
[NASA-CR-165353] N82-12444

EXHAUST GASES

Evaluation of shale oil as a utility gas-turbine fuel
[DE81-904234] N82-12251

EXHAUST NOZZLES

An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on model scale effects
[AD-A104905] N82-12392

EXHAUST SYSTEMS

Novel limiter pump topologies
[DE81-030029] N82-12947

EXOBIOLOGY

Aerospace medicine and biology. A continuing bibliography with indexes, supplement 224
[NASA-SP-7011(224)] N82-12744

EXOSAT SATELLITE

Energy dissipation in Exosat tanks: Test results
[CNES-NT-99] N82-12103

EXPANSION

Buckling of a thin initially wrinkled rectangular plate
[DE81-029963] N82-12479

EXPERIMENTAL DESIGN

Spacecraft Dynamics as Related to Laboratory Experiments in Space — conference
[NASA-CP-2199] N82-12109

Dynamics of superfluid helium in zero gravity — Spacelab 2 investigation N82-12111

Geophysical fluid dynamics N82-12112

Drop dynamics N82-12113

Tribology experiment — journal bearings and liquid lubricants N82-12117

A statistical evaluation of OHMSETT testing
[PB81-226128] N82-12679

On probability proportional to size sampling designs: Their construction, algebraic properties, and applications N82-12871

EXPLORER 56 SATELLITE

AE-5 end of mission tests report — Explorer 55 satellite
[NASA-TM-83845] N82-12099

EXPLOSIONS

Investigation of the structural degradation and personnel hazards resulting from helicopter composite structures exposed to fires and/or explosions
[AD-A104757] N82-12057

Propagation of a liquid-liquid explosion
[DE81-030780] N82-12252

Application of the Pisces two dimensional ELK program to explosion calculations
[N-40-2815-0] N82-12267

EXPLOSIVES

A search for new fuel components in explosive mixtures with ammonium nitrate
[AD-A104881] N82-12245

Evaluation of active and passive near-millimeter-wave radiometric imaging techniques for detection of concealed objects
[DE81-031938] N82-12316

EXPONENTIAL FUNCTIONS

Natural exponential families with quadratic variance functions
[P-6637] N82-12844

EXPOSURE

Genetic and mean bone-marrow doses from medical use of unsealed radioisotopes
[ARL/TR-023] N82-12763

Anti-exposure technology identification for mission specific operational requirements
[AD-A105070] N82-12784

EXTERNAL STORE SEPARATION

A source-doublet approach to modeling triple ejector rack store configurations and force calculations
[AD-A105427] N82-12045

EXTINCTION

The extinction by small aluminum particles from the far infrared to the vacuum ultraviolet N82-12960

EXTRATERRESTRIAL RADIATION

A study of galactic light, extragalactic light, and galactic structure using Pioneer 10 observations of background starlight N82-13040

EXTRAVEHICULAR ACTIVITY

Space Construction Experiment Definition Study (SCEDS), part 1. Volume 1: Executive summary
[NASA-CR-167458] N82-12094

Space Construction Experiment Definition Study (SCEDS), part 1. Volume 2: Study results
[NASA-CR-167432] N82-12095

EXTREMELY HIGH FREQUENCIES

Estimation of the cumulative attenuation distribution due to rain on a path exceeding 1]kc2]km, given the cumulative distribution due to rain on a path of 1km — 94 GHz
[PHL-1980-13] N82-12328

F

F-16 AIRCRAFT
An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on model scale effects
[AD-A104905] N82-12392
F-106 AIRCRAFT
Investigation of severe lightning strike incidents to two USAF F-106A aircraft
[NASA-CR-165794] N82-12052
FABRICATION
Ion implanted GaAs I. C. process technology
[AD-A104946] N82-12360
Blue light emitting luminescent diodes of silicon carbide --- fabrication
[BMFT-FB-T-81-010] N82-12366
Advanced cooling full-scale engine demonstration
[DE81-904253] N82-12452
Feasibility study on the fabrication of longitudinally welded heat exchanger tubes for sea water desalination plants on a factory ship
[BMFT-FB-M-80-004] N82-12453
Method for precision forming of low-cost, thin-walled slotted waveguide arrays for the SPS N82-12558
Technology of tomorrow: Computer assisted design and fabrication
[CETIM-1.4A.32.3] N82-12626
ORELA electron guns
[DE81-030703] N82-12923
Production interferometric testing of diamond-turned surfaces
[DE82-000172] N82-12937
FAILURE ANALYSIS
Instrument failure detection for a linear uncertain system N82-12073
Steam turbine blades: Considerations in design and a survey of blade failures
[DE81-904249] N82-12450
A critical void growth failure criterion developed for dynamic and static loading conditions N82-12469
Rectenna array measurement results N82-12564
FAILURE MODES
The influence of deformation mode during cold forming on the post-formed flow and fracture behavior of low carbon and high strength low alloy steel sheets N82-12207
FAR INFRARED RADIATION
Evaluation of active and passive near-millimeter-wave radiometric imaging techniques for detection of concealed objects
[DE81-031938] N82-12316
The extinction by small aluminum particles from the far infrared to the vacuum ultraviolet N82-12960
FAR ULTRAVIOLET RADIATION
The extinction by small aluminum particles from the far infrared to the vacuum ultraviolet N82-12960
FARADAY EFFECT
Ionospheric propagation correction modeling for satellite altimeters
[NASA-CR-156881] N82-12447
FARMLANDS
Vegetation patterns N82-12500
FAST FOURIER TRANSFORMATIONS
Efficient structure, and algorithms for digital signal processing N82-12296
A pipelined digital SAR azimuth correlator using hybrid FFT/transversal-filter
[NASA-CASE-NPO-15519-1] N82-12298
FATIGUE (MATERIALS)
Flight trail of the Aircraft Fatigue Data Analysis System (AFDAS) Mk 2 prototype
[AD-A105270] N82-12066
Miniaturized fatigue crack growth specimen technology and results
[DE81-029757] N82-12481
Working strength of notched specimens in steel Ck45 and steel 42 Cr Mo4
[LBF-FB-155(1980)] N82-12483
FATIGUE LIFE
Effect of fighter attack spectrum on composite fatigue life
[AD-A105034] N82-12143
A fundamental study of fatigue in powder metallurgy aluminum alloys
[AD-A106080] N82-12219
FATIGUE TESTS
Fatigue phenomena in copper
[RISO-M2241] N82-12225
Working strength of notched specimens in steel Ck45 and steel 42 Cr Mo4
[LBF-FB-155(1980)] N82-12483
FAULT TOLERANCE
Fault testing and diagnosis implementation in microprocessor controlled data networks
[ESNT-D-81001] N82-12836
FEASIBILITY ANALYSIS
Transportation systems evaluation methodology development and applications, phase 3
[NASA-CR-164999] N82-12051
Feasibility study of device synthesis of non-linear filters
[AD-A105417] N82-12354
Assessment of the potential of coal-fueled heat engines in total and integrated energy systems
[DE82-000169] N82-12587
Modular hydro dam approach to the economic development of ultra low-head hydropower
[DE81-027817] N82-12635
FEDERAL BUDGETS
Photovoltaic market analysis program: Background, model development, applications and extensions
[DE81-029711] N82-12609
FEED SYSTEMS
Automation of a specimen stage in an electron microphobe
[DE81-030691] N82-12422
FEEDBACK
Comments on the measurement of linear dependence and feedback between multiple time series by John Geweke
[AD-A104741] N82-12877
FEEDBACK CONTROL
Experimental and analytical studies of advanced air cushion landing systems
[NASA-CR-3476] N82-12065
Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164983] N82-12080
Research developing closed loop roll control for magnetic balance systems
[NASA-CR-164989] N82-12084
Control systems improvements in a precision coordinate measuring machine
[DE82-000024] N82-12281
Advanced electrofluidic servovalve development
[AD-A105172] N82-12361
FEEDFORWARD CONTROL
Identification of the adaptive feedback of the human motor system using the response difference method N82-12754
FERMENTATION
Fermentation kinetics and process development for enhanced rate of production of ethanol from carbohydrates N82-12155
Microbial methane fermentation kinetics for toxicant exposure
[AD-A104668] N82-12243
Ethanol production via fungal decomposition and fermentation of biomass, phase 2
[DE82-000104] N82-12256
Ethanol production via fungal decomposition and fermentation of biomass
[DE82-000103] N82-12257
FERRITES
Analysis of coaxial EMI feedthrough filters containing ferrite elements
[AD-A105248] N82-12353
FERROELECTRICITY
A phenomenological theory for predicting the temperature dependence of elastic compliance in simple proper ferroelectric tungstenbronzes N82-12214
Elastic domain wall waves in ferroelectric ceramics and single crystals
[AD-A105110] N82-12971
FERROMAGNETIC MATERIALS
Impurity resistance in ferromagnetic metals N82-12963
FIBER OPTICS
An advanced 500-MHZ-bandwidth fiber-optic signal link for EMP and general laboratory applications
[AD-A105118] N82-12314
Low-loss fiber waveguides
[AD-A104943] N82-12358
Portable air driven variable speed fiber optic cable termination polisher
[AD-A104797] N82-12448
SPS fiber optic link assessment N82-12550
FIBER RELEASE
Hybridized polymer matrix composite
[NASA-CR-165340] N82-12139
FIELD EFFECT TRANSISTORS
Nonuniformly doped gallium arsenide microwave power MESFETs N82-12337
Silicon-on-sapphire medium power MESFET
[AD-A105376] N82-12352
SPS solid state antenna power combiner N82-12567
FIELD EMISSION
Field emission cold cathode devices based on eutectic systems
[AD-A104795] N82-12357
FIELD THEORY (PHYSICS)
Axial translation of field-reversing relativistic electron rings N82-12915
FIGHTER AIRCRAFT
A source-doublet approach to modeling triple ejector rack store configurations and force calculations
[AD-A105427] N82-12045
FILM THICKNESS
Silver films for solid state bonding
[DE82-000414] N82-12223
Metallic film thickness requirements for mirrors in the infrared --- United Kingdom infrared telescope (UKIRT)
[UKIRT-13] N82-13026
FINANCIAL MANAGEMENT
Status of the Great Plains coal gasification plant
[EMD-81-64] N82-12242
FINES
Fines recycle modeling for an atmospheric fluidized-bed coal combustor --- combustion efficiency
[DE81-904223] N82-12185
FINITE DIFFERENCE THEORY
A second-order accurate procedure for solving the boundary layer equations based on the predictor-corrector form of the Crank-Nicolson scheme
[NAL-TR-655T] N82-12384
Two-dimensional mesh ajustment algorithm
[AD-A105439] N82-12853
Application of the Osher-Engquist difference scheme and the full multigrid method to a two dimensional nonlinear elliptic model equation
[MC-NW-103/81] N82-12858
Numerical techniques in linear duct acoustics, 1980-81 update
[NASA-TM-82730] N82-12890
FINITE ELEMENT METHOD
Finite element analysis of soil-sheet pile interaction N82-12266
Modelling of soil-structure interaction by finite and infinite elements
[PB81-229270] N82-12267
A solution of the Navier-Stokes equations by a mixed finite element method
[ESA-TT-720] N82-12416
Wave induced vibrations of continuous floating structures N82-12467
Viscoplastic and creep crack growth analysis by the finite element method
[AD-A105120] N82-12476
The queueing delay problem in multiple access schemes N82-12838
Deep anistropic shell program for tire analysis
[NASA-CR-3483] N82-12845
Numerical techniques in linear duct acoustics, 1980-81 update
[NASA-TM-82730] N82-12890
FINS
Yawsonde tests of 2.75-inch Mk66 mod 1rocket
[AD-A104904] N82-12101
FIRE EXTINGUISHERS
Fire extinguishant materials
[NASA-CASE-ARC-11252-1] N82-12188
FIRES
Investigation of the structural degradation and personnel hazards resulting from helicopter composite structures exposed to fires and/or explosions
[AD-A104757] N82-12057
Hybridized polymer matrix composite
[NASA-CR-165340] N82-12139
Quantitative analysis of atmospheric pollution phenomena N82-12505
FITTING
Incoherent scatter ion line fitting package
[KGI-TR-032] N82-12321

Fitting of negative binomial distributions using the APL program GRPFITNEG
[A-79-ST-44-24] N82-12880

FIXED POINTS (MATHEMATICS)
A model for uncoordinated distributed computation of fixed points
[AD-A104819] N82-12850

FLAME PROPAGATION
Combustion experiments in space N82-12115
Structure of laminar premixed flames of methane, methanol and their blends in oxygen N82-12164
The transition from deflagration to detonation N82-12380

FLAME RETARDANTS
Formulation and characterization of polyimide resilient foams of various densities for aircraft seating applications
[NASA-CR-167421] N82-12230

FLAME STABILITY
Combustion and emission characteristics of a model gas turbine combustor burning lean heterogeneous mixtures — effect of degree of atomizing
[NAL-TR-686] N82-12171

FLAME TEMPERATURE
CARS spectroscopy of gun propellant flames
[AD-A105224] N82-12177

FLAT PLATES
The response of two fluid-coupled plates to an incident pressure pulse
[AD-A104801] N82-12475
Improvement of thermal efficiency of flat plate solar collectors
[BMFT-FB-T-80-194] N82-12642

FLEXIBLE SPACECRAFT
The dynamics and control of large flexible space structures
[NASA-CR-164982] N82-12096

FLIGHT CONTROL
Fixed gain controller design for aircraft
[AD-A104877] N82-12081

FLIGHT CREWS
An investigation into pilot and system response to critical in-flight events. Volume 1: Executive summary
[NASA-CR-164993] N82-12782
An investigation into pilot and system response to critical in-flight events. Volume 2: Appendix
[NASA-CR-164994] N82-12783

FLIGHT HAZARDS
An investigation into pilot and system response to critical in-flight events. Volume 1: Executive summary
[NASA-CR-164993] N82-12782
An investigation into pilot and system response to critical in-flight events. Volume 2: Appendix
[NASA-CR-164994] N82-12783

FLIGHT PATHS
Application of singular perturbation theory N82-12050

FLIGHT SAFETY
Computer Air Carrier Symposium
[AD-A104894] N82-12054
Summary of Federal Aviation Administration responses to National Transportation Safety Board safety recommendations
[AD-A104922] N82-12055
Orienting description of air traffic control in the Netherlands
[VTH-LR-285] N82-12063

FLIGHT SIMULATION
The effect of visual information on manual approach and landing
[NLR-MP-80019-U] N82-12064
An investigation into pilot and system response to critical in-flight events. Volume 1: Executive summary
[NASA-CR-164993] N82-12782
An investigation into pilot and system response to critical in-flight events. Volume 2: Appendix
[NASA-CR-164994] N82-12783

FLIGHT TESTS
Flight trail of the Aircraft Fatigue Data Analysis System (AFDAS) Mk 2 prototype
[AD-A105270] N82-12086
Application of Pulse Code Modulation (PCM) technology to aircraft dynamics data acquisition
[AD-A104775] N82-12088

FLOATS
Wave induced vibrations of continuous floating structures N82-12487

FLORIDA
Conversion of municipal solid waste to energy. Jacksonville, Florida, phase 1
[DE82-000808] N82-12613

FLOW
The AGCE apparatus N82-12717

FLOW CHARACTERISTICS
Description and calibration of the Langley unitary plan wind tunnel
[NASA-TP-1905] N82-12035
Ring eddy flow metamorphosis as a basis for implosion of partial vacuums, Schwenk's drop picture method and cutting by means of a water jet
[MPIS-13/1980] N82-12401
Self-induced pulsating liquid flow in a hydraulic system
[MPIS-15/1980] N82-12414

FLOW CHARTS
Software modeling studies. Volume 4: A statistical theory of computer program testing
[AD-A105078] N82-12825
Software modeling studies. Volume 2: The polynomial measure of complexity
[AD-A105004] N82-12826
Error propagation in the gravity model N82-12869

FLOW DISTRIBUTION
The numerical solution of incompressible turbulent flow over airfoils N82-12030
Interaction of upstream flow distortions with high Mach number cascades
[NASA-TM-82759] N82-12043
A source-doublet approach to modeling triple ejector rack store configurations and force calculations
[AD-A105427] N82-12045
Tubular electrodes in flow injection analysis N82-12149

FLOW EQUATIONS
Geophysical fluid dynamics N82-12112
Computational fluid mechanics and its impact on the aircraft aerodynamicist
[DGLR-PAPER-81-3] N82-12409
Calculation of transient and quasi-stationary flows in high temperature reactors with spherical nuclear fuel elements, using the vortex flow method
[IKE-4-96] N82-12928

FLOW GEOMETRY
Transonic airfoil design of full potential flow. 1: Numerical procedure and its computational examples
[NAL-TR-672] N82-12038
The Numerical Studies Program for the Atmospheric General Circulation Experiment (AGCE) for Spacelab Flights
[NASA-CP-2200] N82-12715
Overview N82-12716
The AGCE apparatus N82-12717
Hydrostatic calculations of axisymmetric flow and its stability for the AGCE model N82-12718
Cylindrical annulus models N82-12719
Preliminary regime diagram on a sphere with a simplified general circulation model N82-12723

FLOW MEASUREMENT
An experimental study of a turbulent vortex ring N82-12032
Tubular electrodes in flow injection analysis N82-12149
Calculation and measurement of the turbulence of an incompressible flow in a labyrinth seal between a rotating shaft and a cylinder at rest
[EPFL-ITA-6] N82-12382
Model verification studies using accurate measurements of spin up N82-12722

FLOW THEORY
Model verification studies using accurate measurements of spin up N82-12722
Preliminary regime diagram on a sphere with a simplified general circulation model N82-12723

FLOW VELOCITY
An experimental study of a turbulent vortex ring N82-12032

FLOW VISUALIZATION
A pulse-forming network for particle path visualization — at Ames Aeromechanics Water Tunnel Facility
[NASA-TM-81311] N82-12036

FLOWMETERS
Density-measurement studies at the BI-GAS pilot plant
[DE82-000910] N82-12262

FLUID DYNAMICS
Dynamics of superfluid helium in zero gravity — Spacelab 2 investigction N82-12111
Geophysical fluid dynamics N82-12112
Drop dynamics N82-12113
Interactions between spacecraft motions and the atmospheric cloud physics laboratory experiments N82-12114
Effects of spacecraft motions on fluids experiments N82-12120
The response of two fluid-coupled plates to an incident pressure pulse
[AD-A104801] N82-12475

FLUID FILLED SHELLS
Energy dissipation in Exosat tanks: Test results
[CNES-NT-99] N82-12103
Compression stress relaxation testing for determining the performance of elastomeric fluid shells N82-12459

FLUID FLOW
Susceptibility of materials processing experiments to low-level accelerations N82-12118
Methods of calculating heat transfer within the passages of heat exchangers
[HTS/81/4] N82-12411

FLUID MECHANICS
Spacecraft Dynamics as Related to Laboratory Experiments in Space — conference
[NASA-CP-2199] N82-12109
Defining critical point experiments for a space laboratory N82-12110
Propagation of a liquid-liquid explosion
[DE81-030790] N82-12252
Modified face seal for positive film stiffness
[NASA-CASE-LEW-12989-1] N82-12442

FLUIDIZED BED PROCESSORS
Industrial application of fluidized-bed combustion
[DE81-030272] N82-12182
Fines recycle modeling for an atmospheric fluidized-bed coal combustor — combustion efficiency
[DE81-904223] N82-12185
Thermal processing of used catalysts
[BMFT-FB-T-80-189] N82-12205
Development of hydroconversion of biomass to synthetic fuels
[DE81-030954] N82-12260

FLUORESCENCE
Synchronous fluorescence/matrix isolation method for trace organic analysis
[DE81-030958] N82-12193

FLUTTER
Experimental and analytical studies of advanced air cushion landing systems
[NASA-CR-3476] N82-12065

FLUTTER ANALYSIS
Aeroelasticity matters: Some reflections on two decades of testing in the NASA Langley transonic dynamics tunnel
[NASA-TM-83210] N82-12041
Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164983] N82-12080

FLUX DENSITY
A two-dimensional study of the maximum power that can be obtained from a wind turbine in a wind shear layer
[FFA-134] N82-12537

FLY BY WIRE CONTROL
Reliability analysis of the F-8 digital fly-by-wire system
[NASA-CR-163110] N82-12079

FOAMING
Study of foaming characteristics and foaming under pressure: Deaerating lubricants and the influence of antifoaming additives
[CETIM-1.2E.12.3-PT-5] N82-12455

FOAMS
Formulation and characterization of polyimide resilient foams of various densities for aircraft seating applications
[NASA-CR-167421] N82-12230

FOOD CHAIN
Biogeochemical studies of technetium in marine and estuarine ecosystems
[DE81-030325] N82-12672

FORCED VIBRATION
Applications of vibrating wire electrodes to electroanalysis N82-12148

FORECASTING
Models for forecasting energy use in the US farm sector
[DE81-904220] N82-12580
Benefit-cost analysis with uncertain information: An application in air pollution control N82-12662
FOREST MANAGEMENT
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030366] N82-12904
FORESTS
Vegetation patterns N82-12500
User manual for SILVA: A computer code for estimating effects of pollution on the growth and succession of Western coniferous forests
[DE82-000134] N82-12684
FORMALDEHYDE
Midway house-tightening project: A study of indoor air quality — concentrations of radon formaldehyde, and nitrogen dioxide
[DE81-030666] N82-12277
FORMALISM
Parallel string parsing using lattice graphs
[AD-A105026] N82-12820
FORMING TECHNIQUES
Method for precision forming of low-cost, thin-walled slotted waveguide arrays for the SPS N82-12558
FORTRAN
HADY-I, a FORTRAN program for the compressible stability analysis of three-dimensional boundary layers — on swept and tapered wings
[NASA-CR-3467] N82-12368
The GLAS editing procedures for the FGGE level II-B data collected during SOP-1 and 2
[NASA-TM-83811] N82-12794
Transonic airfoil design of full potential flow. 2: Development of the FORTRAN code
[NAL-TR-673] N82-12814
PAPIN: A FORTRAN-4 program to calculate cross section probability tables, Bondarenko and transmission self-shielding factors for fertile isotopes in the unresolved resonance region
[DE81-030436] N82-12903
FORWARD SCATTERING
Detection of laser radiation by means of forward scattering in the atmosphere
[PHL-1979-51] N82-12327
FOSSIL FUELS
Economic assessment of advanced central-receiver solar-thermal power systems: Executive summary
[DOE/SF-10601/0] N82-12624
Overview of the biomedical and environmental programs at the Oak Ridge National Laboratory
[DE81-027864] N82-12765
FOUNDATIONS
An improved model for soil-structure interaction analysis N82-12269
Behavioral predictions of compacted embankments on rigid foundations — in the Republic of Gabon
N82-12271
FOURIER TRANSFORMATION
Wave induced vibrations of continuous floating structures N82-12467
FRACTIONS
Identification and toxicity of fractionated-shale-oil components
[DE81-028480] N82-12766
FRACTURE MECHANICS
Prefracture behavior of solid propellants
[AD-A104746] N82-12247
FRACTURE STRENGTH
The influence of deformation mode during cold forming on the post-formed flow and fracture behavior of low carbon and high strength low alloy steel sheets N82-12207
Fracture of magnesium aluminate spinel
N82-12213
Mechanical properties of a 4142 steel pressure vessel for auxiliary closures
[DE81-030963] N82-12460
FRAME PHOTOGRAPHY
Explosion experiments using cylindrical and conical charges
[N-40-1671-0] N82-12239
FREDHOLM EQUATIONS
The numerical solution of Fredholm integral equations of the first kind N82-12643
The automatic solution of Fredholm equations of the second kind
[MC-NW-80/80] N82-12655
A numerical solution for two-dimensional Fredholm integral equations of the second kind with kernels of the logarithmic potential form
[NASA-TM-81299] N82-12665
FREE CONVECTION
Transient thermal convection in microgravity
N82-12121
Experimental and analytical study of natural convection heat transfer of internally heated fluids
N82-12376
FREE ELECTRON LASERS
Coherent and incoherent radiation from free electron lasers with an axial guide field
[AD-A104606] N82-12434
Experiments with waves on relativistic electron beams
[AD-A105094] N82-12918
FREE RADICALS
Studies of free radicals by ultraviolet excimer laser photolysis
[DE82-000668] N82-12184
Application of ion cyclotron resonance spectroscopy, photoionization mass spectrometry and photoelectron spectroscopy to study the properties and reactions of ions in gases
[DE81-030296] N82-12189
Construction and characteristics of an optically pumped FIR-LMR spectrometer — far infrared (FIR) laser magnetic resonance (LMR) spectrometer
[MPIS-18/1980] N82-12436
FREQUENCY DIVISION MULTIPLEXING
Radiographic applications of spatial frequency multiplexing
[NASA-CR-166748] N82-12930
FRESNEL REFLECTORS
Metallic film thickness requirements for mirrors in the infrared — United Kingdom infrared telescope (UKIRT)
[UKIRT-13] N82-13026
Thin mirror telescopes: Experience gained with the UK infrared telescope
[UKIRT-14] N82-13027
FRICTION FACTOR
Friction and wear behavior of Ti-6Al-4V and a Ni base alloy (Hastelloy C-276) N82-12439
FUEL CELLS
Energy savings by means of fuel-cell electrodes in electro-chemical industries
[DE81-030975] N82-12582
FUEL COMBUSTION
Fuel nitrogen conversion during fuel rich combustion of pulverized coal and char N82-12156
Chemistry of combustion of fuel-water mixtures
[AD-A105401] N82-12178
Evaluation of shale oil as a utility gas-turbine fuel
[DE81-904234] N82-12251
FUEL CONSUMPTION
AGT-102 automotive gas turbine
[NASA-CR-165353] N82-12444
National interim energy-consumption survey: Exploring the variability in energy consumption
[DE81-029910] N82-12589
Performance analysis of 11 Denver Metro passive homes
[DE81-025473] N82-12626
Impact of fuel-economy shortfall: Trends in technology-weighted EPA versus on-road MPG. Periodic analysis memorandum no. 1
[DE81-030641] N82-12667
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 1: Summary
[PB81-219479] N82-13018
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 2: Appendices A through C
[PB81-219487] N82-13019
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 3: Appendix D
[PB81-219495] N82-13020
FUEL OILS
Fundamental combustion studies of burning oil-spray flames
[DE81-904248] N82-12186
FUEL PRODUCTION
Fermentation kinetics and process development for enhanced rate of production of ethanol from carbohydrates N82-12155
State of the art of methane gas enhancement in landfills
[DE82-000155] N82-12253
The severity of institutional barriers affecting energy-from-municipal-waste technologies
[DE82-000133] N82-12583
FUEL TANKS
Energy dissipation in Exocet tanks: Test results
[CNES-NT-99] N82-12103
FUEL-AIR RATIO
Combustion and emission characteristics of a model gas turbine combustor burning lean heterogeneous mixtures — effect of degree of atomizing
[NAL-TR-666] N82-12171
FUELS
MASEC industrial fuel-wood program
[DE82-000461] N82-12595
FUNCTIONS (MATHEMATICS)
The problem of axially symmetric flow of ideal rigid-plastic Huber-Mises medium without any specific hypotheses
[ISSN-0208-5658] N82-12463
FUNGI
Ethanol production via fungal decomposition and fermentation of biomass, phase 2
[DE82-000104] N82-12256
Ethanol production via fungal decomposition and fermentation of biomass
[DE82-000103] N82-12257
FURNACES
Transient and diffusion analysis of Hg Cd Te
[NASA-CR-161524] N82-12984
FUZZY SETS
A statistical approach to fuzzy data analysis
N82-12864

G

GABON
Behavioral predictions of compacted embankments on rigid foundations — in the Republic of Gabon
N82-12271
GADOLINIUM
Materials for magnetic refrigeration between 2 and 20 K
[DE81-024031] N82-12284
GALACTIC STRUCTURE
A study of galactic light, extragalactic light, and galactic structure using Pioneer 10 observations of background starlight N82-13040
GALERKIN METHOD
An error estimate for the H exp (-1) Galerkin method for a parabolic with non-smooth initial data
[CTH-MATH-1981-11] N82-12854
GALILEAN SATELLITES
Orbit improvement of the satellites of the outer planets
[NASA-CR-164967] N82-13037
GALLIUM
Materials for magnetic refrigeration between 2 and 20 K
[DE81-024031] N82-12284
GALLIUM ARSENIDES
Nonuniformly doped gallium arsenide microwave power MESFETs N82-12337
Ion implanted GaAs I. C. process technology
[AD-A104946] N82-12360
Selected area growth for digital integrated circuits and atomic plane doping of gallium arsenide by molecular beam epitaxy N82-12956
Effects of uniaxial stress on the Schottky-Barrier electroreflectance spectra of GaAs and GaP
N82-12959
Modeling of thin-film GaAs growth
[NASA-CR-164992] N82-12965
Research and development on new technologies for the preparation of III-V semiconductor materials and on methods for evaluation of the quality of these materials. Project Ga(AsP) expitaxial layers and substrates for them
[BMFT-FB-T-81-020] N82-12962
GALLIUM COMPOUNDS
Deep levels in Al sub x Ga sub 1 xAs:Fe single crystals
[AD-A105233] N82-12970

GALLIUM PHOSPHIDES
Effects of uniaxial stress on the Schottky-Barrier electroreflectance spectra of GaAs and GaP
N82-12959
GAME THEORY
Topical survey, 1980-1981 — game-theoretic models of multiperson decision problems
[AD-A105117] N82-12884
GAMMA FUNCTION
Natural exponential families with quadratic variance functions
[P-6637] N82-12844
GAMMA RAY SPECTROMETERS
Investigations and applications of polarimetric and high resolution Moessbauer spectroscopy
N82-12170
GAPS
A tile-gap flow model for use in aerodynamic loads assessment of space shuttle thermal protection system: Parallel gap faces
[NASA-TM-83151] N82-12387
GARMENTS
Zipper rear closure endurance testing
[AD-A104732] N82-12785
GARNETS
Materials for magnetic refrigeration between 2 and 20 K
[DE81-024031] N82-12284
GAS ANALYSIS
Requirements document for mini system test unit
[NASA-CR-167436] N82-12167
Limit on remote FTIR detection of trace gases
[AD-A104842] N82-12511
Development of elemental analyzer to programmable calculator interface
[DE82-000695] N82-12802
GAS COMPOSITION
Microwave limb sounder — measuring trace gases in the upper atmosphere
[NASA-CASE-NPO-14544-1] N82-12685
GAS DETECTORS
Hydrogen and hydrocarbon absorption and desorption in sensors with transition metal gates on MOS capacitors N82-12331
Remote determination of atmospheric gases with a DF laser
[GKSS-80-E-40] N82-12711
GAS DISCHARGES
Infrared emission spectroscopy of low pressure gaseous discharges
[AD-A104123] N82-12180
GAS DISSOCIATION
Analytical expressions for specific heats and isentropic exponents of high-temperature gases with their applications
[NAL-TR-671] N82-12984
GAS FLOW
Two-phase flow and heat transfer under low gravity N82-12116
GAS PRESSURE
Monte Carlo simulation of molecular flow in a neutral-beam injector and comparison with experiment
[DE82-000503] N82-12909
GAS RECOVERY
Evaluation of landfill gas as an energy source — feasibility of methane recovery from landfills
[DE82-000116] N82-12564
GAS STREAMS
Simple code for chemical equilibrium and thermodynamic properties for use with GPSAP
[ANL/MHD-81-11] N82-12183
GAS TRANSPORT
Monte Carlo simulation of molecular flow in a neutral-beam injector and comparison with experiment
[DE82-000503] N82-12909
GAS TURBINE ENGINES
Progress in protective coatings for aircraft gas turbines: A Review of NASA sponsored research
[NASA-TM-82740] N82-12216
AGT-102 automotive gas turbine
[NASA-CR-165353] N82-12444
Advanced cooling full-scale engine demonstration
[DE81-904253] N82-12452
Low NO sub x heavy fuel combustor concept program
[NASA-CR-165512] N82-12572
GAS TURBINES
Combustion and emission characteristics of a model gas turbine combustor burning lean heterogeneous mixtures — effect of degree of atomizing
[NAL-TR-686] N82-12171
Evaluation of shale oil as a utility gas-turbine fuel
[DE81-904234] N82-12251
Investigation and research of specific combustion-turbine and combined-cycle field problems
[DE81-904231] N82-12592
GAS-METAL INTERACTIONS
Comments on the hydrogen solubility data for liquid lead, lithium and lithium-lead alloys and review of a tritium-solubility model for lithium-lead alloys — tritium breeding blanket
[DE81-030828] N82-12220
Electron field emission tunneling spectroscopy of platinum group and tungsten metals in the presence of molecular gas and noble metal adsorbates
N82-12957
GAS-SOLID INTERACTIONS
Time-of-flight spectroscopy of molecular structure, collision processes and gas-surface interactions
[AD-A105438] N82-12898
GASEOUS DIFFUSION
Diffusion of gases in capillaries
[DE82-000267] N82-12906
GASEOUS FUELS
Feasibility and economic study of medium-Btu coal gas blended with high-Btu by-product gas as an industrial energy source at Billings, Montana
[DE81-030622] N82-12254
GASIFICATION
Treatment of biomass-gasification wastewaters using liquid-liquid extraction
[DE82-000711] N82-12662
GASOHOL (FUEL)
Project for reliability fleet testing of alcohol/gasoline blends
[DE82-000004] N82-12250
GASOLINE
Impact of fuel-economy shortfall: Trends in technology-weighted EPA versus on-road MPG. Periodic analysis memorandum no. 1
[DE81-030641] N82-12667
GASTROINTESTINAL SYSTEM
Gastrointestinal allergy in the experimental animal: The use of radioiodinated serum albumin in the assessment of new drugs
[IAEA-R-2067-F] N82-12741
GAUGE THEORY
Fundamental tests and measures of the structure of matter at short distances
[DE81-030644] N82-12978
GAUSS EQUATION
Discrimination rules based on marginal distributions N82-12867
GEARS
Vibration test procedures for accessory angle drive gearboxes on Atar 09C engines — turbojet engines
[AD-A105269] N82-12076
GENERAL AVIATION AIRCRAFT
Design study report for General Aviation Loran-C receiver
[AD-A104921] N82-12062
GENETIC ENGINEERING
Repair of chemical damage in mammalian cells
[DE81-030623] N82-12757
GENETICS
Biological effects of low doses of ionizing radiation: Three review papers
[AECL-7059] N82-12758
Genetic and mean bone-marrow doses from medical use of unsealed radioisotopes
[ARL/TR-023] N82-12763
GEOCHEMISTRY
Geophysical survey, Paso Robles geothermal area, California, part of the resource assessment of low- and moderate-temperature geothermal resource areas in California
[DE81-026038] N82-12517
Hydrogeochemical and stream sediment reconnaissance basic data for Teshekpuk Quadrangle, Alaska
[DE81-027408] N82-12531
Fundamental studies in geodynamics
[NASA-CR-164990] N82-12696
Geochemical modeling: A review
[DE81-026969] N82-12708
GEODESY
Military geodesy and geospace science unit four
[AD-A105073] N82-12702
Military geodesy and geospace science, unit two
[AD-A105071] N82-12703
GEODETIC SURVEYS
On the geodetic stability of the Goddard Optical Research Facility
[NASA-TM-82175] N82-12692
GEODYNAMICS
Fundamental studies in geodynamics
[NASA-CR-164990] N82-12696
NASA geodynamics program
[NASA-TM-84010] N82-12697
GEOIDS
Global isostatic geoid anomalies for plate and boundary layer models of the lithosphere
[NASA-CR-164985] N82-12695
Fundamental studies in geodynamics
[NASA-CR-164990] N82-12696
GEOLOGICAL FAULTS
Global Tectonics: Some Geologic analyses of observations and photographs from Skylab
N82-12494
GEOLOGICAL SURVEYS
Skylab explores the Earth
[NASA-SP-380] N82-12492
Geophysical survey, Paso Robles geothermal area, California, part of the resource assessment of low- and moderate-temperature geothermal resource areas in California
[DE81-026038] N82-12517
Resource assessment of Low and Moderate-temperature geothermal waters in Calistoga, Napa County, California
[DE81-025559] N82-12518
Peat resource evaluation: State of Maine
[DE82-000227] N82-12523
Peat deposits of Dismal Swamp pocosins: Camden, Currituck, Gates, Pasquotank, and Perquimans Counties, North Carolina
[DE81-029642] N82-12524
On the geodetic stability of the Goddard Optical Research Facility
[NASA-TM-82175] N82-12692
GEOLOGY
Worldwide directory of national Earth-science agencies and related international organizations
[USGS-CIRC-834] N82-12487
Fundamental studies in geodynamics
[NASA-CR-164990] N82-12696
GEOMAGNETISM
Danish Meteorological Institute, Rude Skov, Geophysical Observatory. Magnetic results
[ISBN-87-7478-187-1] N82-12712
GEOMETRICAL OPTICS
The uniqueness of phase retrieval from intensity measurements
[AD-A105168] N82-12934
GEOMORPHOLOGY
Desert sand seas N82-12493
GEOPHYSICAL FLUIDS
Geophysical fluid dynamics N82-12112
GEOPHYSICS
USSR report: Earth sciences, no. 17
[JPRS-79342] N82-12489
Infrared spectroscopy of microorganisms near 3.4 microns in relation to geology and astronomy
[PREPRINT-69] N82-12713
GEOSTROPHIC WIND
Morphology of stratospheric planetary waves
[AD-A105006] N82-12704
GEOTECHNICAL ENGINEERING
Soil stabilization by chemical additives — phosphoric acid and lime N82-12270
GEOTHERMAL ENERGY CONVERSION
Geothermal reservoir assessment: Northern basin and range province Stillwater prospect, Churchill County, Nevada
[DE82-000529] N82-12516
GEOTHERMAL ENERGY UTILIZATION
Technical databook for geothermal energy utilization
[DE81-029666] N82-12614
Energy technologies and the environment. Environmental information handbook
[DE81-029609] N82-12660

GEOTHERMAL RESOURCES
Formation evaluation in liquid-dominated geothermal reservoirs
[DOE/ET-28394/T1] N82-12514
Geothermal reservoir assessment: Northern basin and range province Stillwater prospect, Churchill County, Nevada
[DE82-000829] N82-12516
Geophysical survey, Paso Robles geothermal area, California, part of the resource assessment of low- and moderate-temperature geothermal resource areas in California
[DE81-030036] N82-12517
Resource assessment of Low and Moderate-temperature geothermal waters in Calistoga, Napa County, California
[DE81-025569] N82-12518
Heat flow studies and geothermal exploration in western Trans-Pecos Texas N82-12694
GIBBS FREE ENERGY
Correlation and prediction of vapor-liquid equilibrium in electrolytic solutions N82-12157
GLACIERS
Effects of volcanism on the glaciers of Mount St. Helens
[USGS-CIRC-850-D] N82-12680
GLASS
Analysis of SPAR 8 single-axis levitation experiment
[NASA-TM-82447] N82-12093
GLASS FIBER REINFORCED PLASTICS
Research and development work concerning a fiber reinforced plastic material which is isoelastic to bone
[BMFT-FB-T-80-083] N82-12146
Glass-mat-reinforced thermoplastic: Strong, easy to work N82-12646
GLASS LASERS
Laser systems for the Combustion Research Facility: Orion
[DE81-030969] N82-12437
GLASSY CARBON
Carbon-supported iron catalysts for CO hydrogenation N82-12154
GLIDE PATHS
Pilot estimates of glidepath and aim point during simulated landing approaches
[NASA-TM-81325] N82-12772
GLUTAMATES
Neurotransmitter mechanisms in the nucleus accumbens septi and related regions in the rat brain
[NDRE/PUBL-81/1001] N82-12736
GOLD
Microstructure formation in the Au-SiO2 cermet during annealing N82-12227
GOLD ALLOYS
Structure: Property relationships in gold based sliding electrical contact materials N82-12210
GONADS
Measurement of gonadal and bone-marrow doses from dental radiography
[ARL/TR-022] N82-12761
Gonadal doses from radiotherapy
[ARL/TR-020] N82-12762
GONIOMETERS
IN situ goniometer — for industrial residual stress measurement
[CETIM-5.41.22.0-PT-1] N82-12485
GOVERNMENT PROCUREMENT
An exploratory study of costs to operate Government-Owned, Contractor-Operated (GOCO) facilities
[AD-A104864] N82-12986
GOVERNMENT/INDUSTRY RELATIONS
Solar explosion
[DE81-026086] N82-12928
An exploratory study of costs to operate Government-Owned, Contractor-Operated (GOCO) facilities
[AD-A104864] N82-12986
GOVERNMENTS
Background and purpose of the study N82-12981
Government management of data processing N82-12988
GRAMMARS
Parallel string parsing using lattice graphs
[AD-A106036] N82-12920
GRAPHITE-EPOXY COMPOSITE MATERIALS
Hybridized polymer matrix composite
[NASA-CR-165340] N82-12139
The effect of resin on the impact damage tolerance of graphite-epoxy laminates
[NASA-TM-82213] N82-12140
Biaxial tests of flat graphite/epoxy laminates
[NASA-CR-165769] N82-12141
In-service inspection methods for graphite-epoxy structures on commercial transport aircraft
[NASA-CR-165746] N82-12142
GRAVELS
Remote sensing studies of some ironstone gravels and plinthite in Thailand N82-12491
GRAVITATION THEORY
Investigations and applications of polarimetric and high resolution Moessbauer spectroscopy N82-12170
GRAVITATIONAL EFFECTS
Gravitational influence on binary alloy melt equilibria and eutectic solidification N82-12215
Deposition of particles in vertical conduits due to electrostatic charge, diffusion, and gravity N82-12377
GRAVITY ANOMALIES
Synthesis of regional crust and upper-mantle structure from seismic and gravity data
[NASA-CR-165001] N82-12696
GRAVITY WAVES
The gravity wave in a liquid with a surface film, in the presence of an applied electric field
[REPT-80-2] N82-12408
An experimental study of the propagation and dispersion of internal atmospheric gravity waves N82-12661
GREEN FUNCTION
Analytical solution of anisotropic heat conduction in simple and irregular regions N82-12379
GREENLAND
The ice conditions in the Greenland waters
[ISBN-87-7478-183-9] N82-12633
GRINDING (COMMINUTION)
New building materials. A contribution to environmental protection. Subproject: Fly ash cement
[BMFT-FB-T-80-176] N82-12295
GROOVES
Development of an improved high performance artery heat pipe
[ESA-CR(P)-1459] N82-12410
GROUND CREWS
An investigation into pilot and system response to critical in-flight events. Volume 2: Appendix
[NASA-CR-164994] N82-12783
GROUND SPEED
The use of groundspeed, in a wind shear and the flight evaluation of a radar-altimeter-based system for the measurement of groundspeed
[AD-A104758] N82-12090
GROUND STATE
Determination of a potential model for the calculation of interatomic potentials in the case of alkali-rare gas interaction
[MPIS-16/1980] N82-12912
GROUND STATIONS
Coherent multiple tone technique for ground based SPS phase control N82-12546
GROUND SUPPORT EQUIPMENT
Hardware survey for the avionics test bed
[NASA-CR-161072] N82-12796
GROUND TESTS
Energy dissipation in Exocet tanks: Test results
[CNES-NT-98] N82-12103
GROUND WATER
Removal of nitrates from ground waters by reverse osmosis
[BMFT-FB-T-80-155] N82-12203
Hydrogeochemical and stream sediment reconnaissance basic data for Ruby Quadrangle, Alaska
[DE81-028982] N82-12512
Resource assessment of Low and Moderate-temperature geothermal waters in Calistoga, Napa County, California
[DE81-025569] N82-12518
Water resources data for New York, water year 1980. Volume 1: Eastern New York excluding Long Island
[PB81-227308] N82-12534
Water resources data for New York, water year 1980. Volume 3: Western New York
[PB81-227316] N82-12536
Assessment of water supply contamination due to underground coal gasification
[PB81-208216] N82-12690
Monitor for detecting nuclear waste leakage in a subsurface repository
[DE81-029429] N82-12967
GROUP DYNAMICS
Topical survey, 1980-1981 — game-theoretic models of multiperson decision problems
[AD-A106117] N82-12984
GUIDANCE (MOTION)
Phase sensitive guidance sensor for wire-following vehicles
[NASA-CASE-NPO-15341-1] N82-12346
GUIDANCE SENSORS
Study on strapdown inertial navigation redundant sensor system
[NAL-TR-680] N82-12066
Phase sensitive guidance sensor for wire-following vehicles
[NASA-CASE-NPO-15341-1] N82-12346
GUIDE VANES
Effect of a part span variable inlet guide vane on TF34 fan performance
[NASA-CR-165456] N82-12075
GULF OF MEXICO
Hydrocarbon composition of sediments, water, and fauna in selected areas of the Gulf of Mexico and Southern California marine environment N82-12732
GULFS
Visual observations of floating ice from Skylab N82-12504
GUN LAUNCHERS
Numerical computation of two phase flow in gun barrels
[HTS/81/6] N82-12413
GUN PROPELLANTS
CARS spectroscopy of gun propellant flames
[AD-A105224] N82-12177
GUN TURRETS
Aerodynamic measurements concerned with a turret model
[NASA-CR-165264] N82-12034
GUSTS
Advanced Shuttle Simulation Turbulence Tapes (SSTT) users guide
[NASA-CR-161890] N82-12108

H

HALIDES
Ceramic microstructure development
[AD-A105364] N82-12223
HALOGENS
Interaction potentials between rare gas atoms and hologen atoms
[AD-A104836] N82-12899
HANDBOOKS
Technology characterizations: Environmental information handbook, second edition
[DE81-029993] N82-12671
HANDLING EQUIPMENT
The removal, mechanical handling and installation procedures for re-aluminising the UKIRT 3.8m primary mirror — United Kingdom Infrared Telescope (UKIRT)
[UKIRT-11] N82-13025
HARDNESS
Cutting tool coatings program
[DE81-026289] N82-12449
HARDWARE
Hardware and software improvements to a paced data acquisition system for turbomachines
[AD-A104853] N82-12797
HASTELLOY (TRADEMARK)
Friction and wear behavior of Ti-6Al-4V and a Ni base alloy (Hastelloy C-276) N82-12439
HAULING
Extensible bridge-conveyor concepts for coal-mine face haulage
[DE81-031974] N82-12525
HAZARDS
Investigation of the structural degradation and personnel hazards resulting from helicopter composite structures exposed to fires and/or explosions
[AD-A104757] N82-12067

HEALTH PHYSICS
Contributions to the genetic and mean bone-marrow doses of the Australian population from radiological procedures
[ARL/TR-017] N82-12764
HEARING
Thresholds of hearing by air conduction and by bone conduction under different masking conditions
[NPL-AC-100] N82-12768
An investigation of the status of bone conduction audiometer calibration in the National Health Service
[NPL-AC-101] N82-12769
HEART RATE
The heart rate of aspirant air pilots in a hypobaric chamber
[IZF-1979-35] N82-12770
HEAT ACCLIMATIZATION
Sweating responses of men and women during exercise in humid and dry heat N82-12745
HEAT BALANCE
The window and its heat balance considering solar radiation and additional insulation measures
[BMFT-FB-T-80-070] N82-12402
HEAT EXCHANGERS
Methods of calculating heat transfer within the passages of heat exchangers
[HTS/81/4] N82-12411
The calculation of heat exchanger performance
[HTS/81/5] N82-12412
High-temperature counter-flow recuperator
[DE81-031923] N82-12424
HEAT OF COMBUSTION
Electric and hybrid vehicle environmental control subsystem study
[NASA-CR-164996] N82-12658
HEAT OF FUSION
Latent heat storage devices. Part 2: Heat storage media, designs and construction materials for heat of fusion storage devices
[BMVG-FBWT-79-13-PT-2] N82-12639
HEAT PIPES
Development of an improved high performance artery heat pipe
[ESA-CR(P)-1459] N82-12410
HEAT PUMPS
Practical demonstration of heat pumps for utilization of animal-generated heat
[BMFT-FB-T-80-100] N82-12403
Air circuit with heating pump
[BMFT-FB-T-80-186] N82-12404
Basic investigations of an absorption heat pump, using heat of median temperature (heat transformer)
[BMFT-FB-T-81-013] N82-12405
United States Department of Energy thermal storage program
[DE81-030263] N82-12585
Seasonal performance factors for active solar systems and heat-pump systems
[DE81-028569] N82-12625
Fuel savings in hot water heating plants by application of heat pumps operated with natural gas (natural gas heat pump). Project: gas engine
[BMFT-FB-T-80-125] N82-12641
The properties of solar and heat pump heating systems of small houses and additional heat sources
[VTT-58] N82-12644
Electric and hybrid vehicles environmental control subsystem study
[NASA-CR-164995] N82-12657
HEAT SOURCES
Use of Sandia's Central Receiver Test Facility as a high-intensity heat source for testing missile nose-cone (radome) radar systems
[DE82-000966] N82-12086
Experimental and analytical study of natural convection heat transfer of internally heated fluids
N82-12378
Assessment of the potential of coal-fueled heat engines in total and integrated energy systems
[DE82-000169] N82-12587
Space nuclear safety and fuels program
N82-12921
HEAT STORAGE
United States Department of Energy thermal storage program
[DE81-030263] N82-12585
Guidebook for solar process-heat applications
[DE81-027977] N82-12598
Latent heat storage devices. Part 1: Characteristics and applicability of latent heat storage devices
[BMVG-FBWT-79-12-PT-1] N82-12638
Latent heat storage devices. Part 2: Heat storage media, designs and construction materials for heat of fusion storage devices
[BMVG-FBWT-79-13-PT-2] N82-12639
Solar project at Almeria nears completion
N82-12647
Electric and hybrid vehicles environmental control subsystem study
[NASA-CR-164995] N82-12657
HEAT TRANSFER
Two-phase flow and heat transfer under low gravity N82-12116
Coprecipitated nickel-alumina methanation catalysts N82-12169
Assessment of pulverized-coal-fired combustor performance
[DE81-030660] N82-12187
Heat transfer in a fixed bed and mass transfer in a counter-current moving bed N82-12373
Technical heat and flow investigations into heat exchangers made out of synthetic materials, for use in dry cooling towers
[BMFT-FB-T-81-004] N82-12407
A two-layer ground hydrology model interactive with an atmospheric circulation model N82-12486
Simulation of the thermal behavior of an object and its nearby surroundings
[PHL-1980-06] N82-12663
HEAT TRANSFER COEFFICIENTS
Experimental and analytical study of natural convection heat transfer of internally heated fluids
N82-12378
Study of ATES thermal behavior using a steady flow model
[DE81-030883] N82-12396
The window and its heat balance considering solar radiation and additional insulation measures
[BMFT-FB-T-80-070] N82-12402
The calculation of heat exchanger performance
[HTS/81/5] N82-12412
HEAT TRANSMISSION
Heat flow studies and geothermal exploration in western Trans-Pecos Texas N82-12684
HEAT TREATMENT
Hydrodesulfurization of chlorinated coal
[NASA-CASE-NPO-15304-1] N82-12240
HEATING
Basic investigations of an absorption heat pump, using heat of median temperature (heat transformer)
[BMFT-FB-T-81-013] N82-12405
Utilization of waste heat from major transformer substations. Volume 1: Generic study
[DE81-904212] N82-12593
HEATING EQUIPMENT
The properties of solar and heat pump heating systems of small houses and additional heat sources
[VTT-58] N82-12644
HEAVY IONS
Description and use of the Monte Carlo code LILITA
[DE81-030704] N82-12904
HEAVY NUCLEI
Nuclear structure study at intermediate energies
[DE81-030156] N82-12911
HELICOPTER PERFORMANCE
Performance and loads data from a wind tunnel test of a full-scale, coaxial, hingeless rotor helicopter
[NASA-TM-81329] N82-12040
HELICOPTER TAIL ROTORS
An analysis of civil aviation propeller-to-person accidents: 1965-1979
[AD-A105365] N82-12053
HELICOPTER WAKES
Experimental and analytical studies of a model helicopter rotor in hover
[NASA-TM-81232] N82-12042
HELICOPTERS
Investigation of the structural degradation and personnel hazards resulting from helicopter composite structures exposed to fires and/or explosions
[AD-A104757] N82-12057
Flight evaluation of LORAN-C as a helicopter navigation aid in the Baltimore Canyon oil exploration area
[AD-A105260] N82-12059
Electronic Master Monitor and Advisory Display System (EMMADS)
[AD-A105062] N82-12067
A vapour cycle cabin cooling system for the Sea King MK.50 helicopter
[AD-A105211] N82-12069
HELIOSTATS
User's guide to HELIOS: A computer program for modeling the optical behavior of reflecting solar concentrators. Part 1: Introduction and code input
[DE81-031920] N82-12616
Manufacturing and cost evaluation of second generation heliostats. Volume 2: Appendices
[DE82-000232] N82-12617
Department of Energy Solar Central Receiver Semiannual Meeting
[SAND-80-8049] N82-12632
HEMOGLOBIN
Separation via multi-column pH parametric pumping N82-12158
HETEROGENEITY
Dehydrogenation/hydrogenation reactions in hydroaromatic systems
[DE81-027667] N82-12201
HETEROJUNCTION DEVICES
Investigation of solar cells based on Cu2 --- with emphasis on junction fabrication
[DE81-030274] N82-12607
HEURISTIC METHODS
Large-scale systems optimization using nonlinear integer goal programming methods N82-12882
HF LASERS
Phoenix 2 energy extraction and angular multiplexing experiments --- laser fusion reactors
[DE81-028972] N82-12919
HIGH ASPECT RATIO
The effect of a translating high aspect ratio particle in a plane slider bearing N82-12440
HIGH CURRENT
High field superconductors of NbTi with current capacities in excess of 3000A for application in magnet systems with alternating field components
[BMFT-FB-T-81-009] N82-12367
HIGH ENERGY INTERACTIONS
Very-high-energy nuclear physics
[DE81-030025] N82-12920
HIGH FREQUENCIES
High-frequency high-voltage high-power DC-to-DC converters N82-12347
HIGH POWER LASERS
A new power meter concept for high energy lasers
[AD-A104624] N82-12432
Coherent and incoherent radiation from free electron lasers with an axial guide field
[AD-A104806] N82-12434
HIGH PRESSURE
Application of high pressures to ceramics
[AD-A105249] N82-12231
A high pressure hydraulic pump: GHP 1000 description
[CETIM-5.42.24.0] N82-12457
HIGH RESOLUTION
Experimental demonstration of Feshbach resonances in atom-molecule scattering, with the help of measurements on the H2(pH2)-Kr and HD-Xe systems
[MPIS-14/1980] N82-12913
HIGH STRENGTH STEELS
The influence of deformation mode during cold forming on the post-formed flow and fracture behavior of low carbon and high strength low alloy steel sheets N82-12207
HIGH TEMPERATURE
Behavior of alkali metal-acid phosphates during elevated temperature water electrolysis
[DE82-000243] N82-12161
HIGH TEMPERATURE GAS COOLED REACTORS
User's guide to the hydrogen monitor --- high temperaure gas cooled reactors
[DE81-032023] N82-12425
HIGH TEMPERATURE GASES
Analytical expressions for specific heats and isentropic exponents of high-temperature gases with their applications
[NAL-TR-671] N82-12984
HIGH TEMPERATURE LUBRICANTS
Thermal oxidative degradation reactions of perfluoroalkylethers
[NASA-CR-165516] N82-12135

HIGH TEMPERATURE NUCLEAR REACTORS

Calculation of transient and quasi-stationary flows in high temperature reactors with spherical nuclear fuel elements, using the vortex flow method [IKE-4-88] N82-12928

HIGH TEMPERATURE PLASMAS

Physics of high temperature, dense plasmas [AD-A105169] N82-12945

HIGH VOLTAGES

High-frequency high-voltage high-power DC-to-DC converters N82-12347

X-ray emission of high voltage vacuum devices N82-12348

Upgrading the intense neutron source high voltage power supply [DE81-029970] N82-12364

HILBERT SPACE

The numerical solution of Fredholm integral equations of the first kind N82-12843

HIPPOCAMPUS

Neurotransmitter mechanisms in the nucleus accumbens septi and related regions in the rat brain [NDRE/PUBL-81/1001] N82-12738

HISTORIES

The history of the development of the rectenna N82-12560

HOLDERS

Liquid immersion apparatus for minute articles [NASA-CASE-MFS-25363-1] N82-12441

HOLE GEOMETRY (MECHANICS)

Influence of a multiaxial membrane stress situation on the stress concentration factor, using the example of an open unfinished drilled hole [EK-43-B/251/79] N82-12484

HOLOGRAPHY

Statistical averaging in position determination by holography under turbulence conditions N82-12417

HOMOGENEITY

A study of time evolution of continuous vortex loops in a homogeneous or stratified fluid N82-12381

HOMOPOLAR GENERATORS

Electrical machines with superconducting windings. Part 3: Homopolar dc machines — with rotating liquid metal contacts [BMFT-FB-T-81-015-PT-3] N82-12369

HOT CATHODES

Electrode design and performance of the ORNL positive ion sources [DE81-030426] N82-12910

HOT PRESSING

Strength evaluation test of hot-pressed silicon nitride at room temperature [NAL-TR-676] N82-12138

Mechanical properties of titanium castings [DE81-030693] N82-12222

HOT-WIRE FLOWMETERS

Measurement of thermal conductivities in coal fluids [DE82-000523] N82-12400

HOVERING

Experimental and analytical studies of a model helicopter rotor in hover [NASA-TM-81232] N82-12042

HUMAN BEHAVIOR

Close-range cine-photogrammetry: A generalized technique for quantifying gross human motion N82-12781

Human control and regulation tasks N82-12787

HUMAN FACTORS ENGINEERING

Computer Air Carrier Symposium [AD-A104884] N82-12054

Energy efficiency buildings program [DE81-028050] N82-12276

Review of human and operational factors affecting the feasibility of the see-and-avoid concept [DFVLR-MITT-81-13] N82-12780

Anti-exposure technology identification for mission specific operational requirements [AD-A105070] N82-12784

Human control and regulation tasks N82-12787

Methodical study of the contribution of the human system to the insecurity of technological systems — computerized accident analysis N82-12788

China report: Science and technology, no. 128 [JPRS-79047] N82-12789

Equipment design must incorporate ease of operation N82-12790

Biomedical technology transfer. Applications of NASA science and technology [NASA-CR-164891] N82-13012

HUMAN REACTIONS

Effects of activity interference on annoyance due to aircraft noise [NASA-TP-1936] N82-12654

HUMAN TOLERANCES

Equipment design must incorporate ease of operation N82-12790

HUMAN WASTES

Solid waste disposal practices: Open dumps not identified. States face funding problems [CED-81-131] N82-12653

HUMIDITY

Adverse weather and night capability: A call for action. Volume 2: Appendix, data base for selected important military locations [AD-A104991] N82-12726

HUMIDITY MEASUREMENT

Integrated humidity sensor — relative humidity of air [BMFT-FB-T-81-007] N82-12426

HURRICANES

On the global circulation and the hurricane system of the Jovian atmosphere [NASA-TM-83633] N82-13034

HYDRATES

Latent heat storage devices. Part 1: Characteristics and applicability of latent heat storage devices [BMVG-FBWT-79-12-PT-1] N82-12638

HYDRAULIC CONTROL

Advanced electrofluidic servovalve development [AD-A105172] N82-12361

HYDRAULIC EQUIPMENT

Generalized study of a hydraulically actuated mechanism system N82-12375

Self-induced pulsating liquid flow in a hydraulic system [MPIS-15/1980] N82-12414

A high pressure hydraulic pump: GHP 1000 description [CETIM-5.42.24.0] N82-12457

HYDROCARBON FUEL PRODUCTION

Development of catalytic systems for the conversion of syngas to jet fuel and diesel fuel and higher alcohols [DE82-000067] N82-12255

HYDROCARBON FUELS

Assessment of the potential of coal-fueled heat engines in total and integrated energy systems [DE82-000169] N82-12587

HYDROCARBONS

Pyrolysis of coal-drived fuels using the laser-powered homogeneous pyrolysis technique [DE82-000251] N82-12196

Hydrocarbon composition of sediments, water, and fauna in selected areas of the Gulf of Mexico and Southern California marine environment N82-12732

Identification and toxicity of fractionated-shale-oil components [DE81-028460] N82-12766

HYDROCRACKING

Catalytic hydrogenation of coal-derived liquids [DE81-030485] N82-12198

HYDRODYNAMICS

Wave induced vibrations of continuous floating structures N82-12467

Innovative equipment for small-scale hydro developments [DE81-027820] N82-12634

HYDROELECTRIC POWER STATIONS

Modular hydro dam approach to the economic development of ultra low-head hydropower [DE81-027817] N82-12635

DOE small-hydropower demonstration program [DE81-027819] N82-12636

Project impact analysis as an optimal control problem — irrigation and hydroelectric power project [DE81-026465] N82-12842

HYDROGEN

A pulse-forming network for particle path visualization — at Ames Aeromechanics Water Tunnel Facility [NASA-TM-81311] N82-12036

User's guide to the hydrogen monitor — high temperature gas cooled reactors [DE81-032023] N82-12425

HYDROGEN COMPOUNDS

Dehydrogenation/hydrogenation reactions in hydroaromatic systems [DE81-027667] N82-12201

HYDROGEN EMBRITTLEMENT

Mechanical properties and hydrogen embrittlement of scandium [DE81-030745] N82-12221

HYDROGEN ISOTOPES

Thermotransport of hydrogen and deuterium in vanadium, niobium and tantalum alloys N82-12208

Comments on the hydrogen solubility data for liquid lead, lithium and lithium-lead alloys and review of a tritium-solubility model for lithium-lead alloys — tritium breeding blanket [DE81-030828] N82-12220

HYDROGEN PRODUCTION

The kinetics of the reverse Deacon reaction N82-12152

Behavior of alkali metal-acid phosphates during elevated temperature water electrolysis [DE82-000243] N82-12181

Assessment of potential future markets for the production of hydrogen from water [BMFT-FB-T-81-012] N82-12266

HYDROGEN-BASED ENERGY

Assessment of potential future markets for the production of hydrogen from water [BMFT-FB-T-81-012] N82-12266

HYDROGENATION

Catalytic hydrogenation of coal-derived liquids [DE81-030485] N82-12198

Dehydrogenation/hydrogenation reactions in hydroaromatic systems [DE81-027667] N82-12201

Hydrodesulfurization of chlorinated coal [NASA-CASE-NPO-15304-1] N82-12240

HYDROGEOLOGY

Geophysical survey, Paso Robles geothermal area, California, part of the resource assessment of low- and moderate-temperature geothermal resource areas in California [DE81-026036] N82-12517

Resource assessment of Low and Moderate-temperature geothermal waters in Calistoga, Napa County, California [DE81-025559] N82-12518

Hydrogeochemical and stream sediment reconnaissance basic data for Harrison Bay Quadrangle, Alaska [DE81-028352] N82-12530

Mount St. Helens volcanic-ash fall in the Bull Run wateshed, Oregon, March - June 1980 [USGS-CIRC-850-A] N82-12688

HYDROLOGY

Assessment of water supply contamination due to underground coal gasification [PB81-209215] N82-12680

HYDROLOGY MODELS

A two-layer ground hydrology model interactive with an atmospheric circulation model N82-12486

HYDROLYSIS

Partial acid hydrolysis pretreatment for enzymatic hydrolysis of cellulose: A process development study of ethanol production N82-12236

HYDROXIDES

Latent heat storage devices. Part 1: Characteristics and applicability of latent heat storage devices [BMVG-FBWT-79-12-PT-1] N82-12638

HYPERBOLIC DIFFERENTIAL EQUATIONS

Numerical experiments for solving symmetric hyperbolic systems with discontinous initial data N82-12792

HYPOBARIC ATMOSPHERES

The heart rate of aspirant air pilots in a hypobaric chamber [IZF-1979-35] N82-12770

HYPOTHERMIA

Anti-exposure technology identification for mission specific operational requirements [AD-A105070] N82-12784

HYSTERESIS

A one-dimensional plane wave propagation code for layered rate-dependent hysteretic materials [AD-A105241] N82-12274

I

I BEAMS

The relation between welding parameters for a beam section and its buckling resistance [CRIF-MT-143] N82-12454

ICE
Structure and origin of cometary nuclei
[NASA-TM-83823] N82-13035
ICE FORMATION
The ice conditions in the Greenland waters
[ISBN-87-7478-183-9] N82-12533
ICE MAPPING
The ice conditions in the Greenland waters
[ISBN-87-7478-183-9] N82-12533
ICE REPORTING
Visual observations of floating ice from Skylab
N82-12504
The ice conditions in the Greenland waters
[ISBN-87-7478-183-9] N82-12533
IGNITION
Combustion experiments in space N82-12115
ILLINOIS
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] N82-12604
Terminal forecast reference notebook for Scott Air Force Base, Illinois
[AD-A105064] N82-12728
IMAGE PROCESSING
Secondary ion mass spectrometric image depth profiling for three-dimensional elemental analysis
[AD-A105092] N82-12172
How a digital computer can tell that a straight line is straight
[AD-A105076] N82-12246
A systolic 2-D convolution chip
[AD-A104872] N82-12351
Military geodesy and geospace science unit four
[AD-A105073] N82-12702
Data rate reduction, phase 2 — breadboard processor for multispectral imagery
[TNOT/0001/SAAB-ISSUE-3] N82-12829
Study on a refined image processing system for space astronomy
[ESA-CR(P)-1458] N82-13017
IMAGE RECONSTRUCTION
A combined source-channel coding approach to image transmission N82-12291
IMAGERY
The image potential and ion trajectories in SIMS
[AD-A105377] N82-12179
IMAGING TECHNIQUES
Development and applications of computer-assisted acoustic holography N82-12418
IMPACT ACCELERATION
A Monte Carlo study of the use of auxiliary information in the developent of an impact acceleration injury prediction model
[AD-A105463] N82-12755
IMPACT DAMAGE
Hybridized polymer matrix composite
[NASA-CR-165340] N82-12139
The effect of resin on the impact damage tolerance of graphite-epoxy laminates
[NASA-TM-83213] N82-12140
Holographic study of impact phenomena — airgun pellets on ceramic targets
[TPD-1980-0-3] N82-12429
IMPACT PREDICTION
A Monte Carlo study of the use of auxiliary information in the developent of an impact acceleration injury prediction model
[AD-A105463] N82-12755
IMPACT RESISTANCE
The effect of resin on the impact damage tolerance of graphite-epoxy laminates
[NASA-TM-83213] N82-12140
IMPACT TESTS
Space nuclear safety and fuels program
N82-12921
IMPACT TOLERANCES
The effect of resin on the impact damage tolerance of graphite-epoxy laminates
[NASA-TM-83213] N82-12140
IMPEDANCE
Electromagnetic diffraction by a narrow slit in an impedance sheet-E-polarization
[AD-A105029] N82-12144
IMPEDANCE PROBES
Impedance probe experiment in project Polar High Atmosphere of the Sounding Rocket Program Aeronomy
[BMFT-FB-W-80-035] N82-12710
IMPERIAL VALLEY (CA)
Seismic Engineering Program Report, September - December 1979
[USGS-CIRC-818-C] N82-12694
IMPLOSIONS
Inertial fusion program
[DE81-030512] N82-12954
IMPURITIES
ECR discharge cleaning experiment in the JIPP T-11
[IPPJ-539] N82-12940
A systematic study of the effects of 3d, 4f and 5f impurities on the critical temperature of superconducting Th; measurements to 20 kilobars
N82-12958
Impurity resistance in ferromagnetic metals
N82-12963
IN-FLIGHT MONITORING
Flight trail of the Aircraft Fatigue Data Analysis System (AFDAS) Mk 2 prototype
[AD-A105270] N82-12066
Electronic Master Monitor and Advisory Display System (EMMADS)
[AD-A105082] N82-12067
INCINERATORS
Nuclear waste incineration technology status
[DE81-025751] N82-12926
INCOHERENT SCATTERING
Incoherent scatter ion line fitting package
[KGI-TR-032] N82-12321
Coherent and incoherent radiation from free electron lasers with an axial guide field
[AD-A104806] N82-12434
INCOMPRESSIBLE FLOW
The numerical solution of incompressible turbulent flow over airfoils N82-12030
On Vortex breakdown and instability
[AD-A104980] N82-12048
Prediction of the incompressible flow over a rearward-facing step N82-12376
Calculation and measurement of the turbulence of an incompressible flow in a labyrinth seal between a rotating shaft and a cylinder at rest
[EPFL-ITA-8] N82-12382
A solution of the Navier-Stokes equations by a mixed finite element method
[ESA-TT-720] N82-12416
INCONEL (TRADEMARK)
Thermal desorption spectra, equilibrium desorption rates and equilibrium surface coverages of mechanically polished and of sand and bead blasted Inconel 600 surfaces
[EUR-7114-EN] N82-12224
INDEPENDENT VARIABLES
Two-dimensional mesh ajustment algorithm
[AD-A105439] N82-12853
INDEXES (DOCUMENTATION)
Index of National Aviation Facilities Experimental Center technical reports 1972 - 1977
[AD-A104759] N82-12056
Worldwide directory of national Earth-science agencies and related international organizations
[USGS-CIRC-834] N82-12487
Japanese Research Institutes funded by the Ministry of Education
[ONRT-M2] N82-13042
INDIA
A computer simulation modeling study to predict air quality impacts from a 500 MW coal-fired power plant N82-12650
INDIANA
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] N82-12604
INDIUM COMPOUNDS
TDPAC study of the In2Se3 crystal structure
[AD-A104729] N82-12974
INDUSTRIAL ENERGY
Feasibility and economic study of medium-Btu coal gas blended with high-Btu by-product gas as an industrial energy source at Billings, Montana
[DE81-030622] N82-12254
Energy conservation in distillation
[DE81-028650] N82-12581
MASEC industrial fuel-wood program
[DE82-000461] N82-12595
INDUSTRIAL MANAGEMENT
An exploratory study of costs to operate Government-Owned, Contractor-Operated (GOCO) facilities
[AD-A104854] N82-12986
INDUSTRIAL SAFETY
The handling, hazards, and maintenance of heavy liquids in the geologic laboratory
[USGS-CIRC-827] N82-12273
Guidance for implementing an environmental, safety and health assurance program. Volume 12: Model guidelines for line organization environmental, safety and health inspection and monitoring activities
[DE81-030991] N82-12668
Guidance for implementing an environmental, safety and health assurance program. Volume 13: Model guidelines for line organization environmental, safety and health meetings
[DE81-030980] N82-12669
Methodical study of the contribution of the human system to the insecurity of technological systems — computerized accident analysis N82-12788
INDUSTRIAL WASTES
Waste-to-energy Systems Institutional Barriers Assessment Workshop
[DE82-000098] N82-12621
Solid waste disposal practices: Open dumps not identified. States face funding problems
[CED-81-131] N82-12653
Environmental control technology for coal cleaning wastes
[DE81-025331] N82-12676
INDUSTRIES
Industry structure N82-13003
Patent licensing contracts in the electronic industry — Denmark
[ECR-104] N82-13011
INELASTIC SCATTERING
Nuclear structure studies by the scattering of medium-energy electrons
[DE81-030058] N82-12905
Nuclear structure study at intermediate energies
[DE81-030158] N82-12911
INERTIAL CONFINEMENT FUSION
Inertial fusion program
[DE81-030512] N82-12954
INERTIAL GUIDANCE
Military geodesy and geospace science, unit two
[AD-A105071] N82-12703
INERTIAL UPPER STAGE
Payload/orbiter signal-processing and data-handling system evaluation
[NASA-CR-161007] N82-12107
INFORMATION
Information in society N82-12993
INFORMATION MANAGEMENT
BENORSY: A formalized instrument for the user oriented revision of dp-systems
[BMFT-FB-DV-81-001] N82-12804
Government management of data processing
N82-12998
INFORMATION RETRIEVAL
Redundancy versus query time trade-offs for data structures N82-13004
Video discs: Their application to information storage and retrieval
[NRCD-12] N82-13006
Defense Technical Information Center free text experiment: Technical report file
[AD-A105449] N82-13007
INFORMATION SYSTEMS
Solar Energy Information Data Bank (SEIDB) program, FY 1981
[DE81-030054] N82-12612
An approach to the management of hazardous materials
[AD-A104869] N82-12987
Computer-based national information systems: Technology and public policy issues
[OTA-CIT-146] N82-12989
Computer-based national information systems: Technology and public policy issues. Summary
N82-12990
Background and purpose of the study N82-12991
Information systems and computers N82-12992
The structure of information policy N82-12994
Innovation, productivity, and employment
N82-12995
Privacy N82-12996
The security of computer systems N82-12997

Society's dependence on information systems
N82-12999
Constitutional rights N82-13000
Regulatory and other issues N82-13001
Defense Technical Information Center free text experiment: Technical report file
[AD-A105449] N82-13007

INFORMATION THEORY
A general thesaurus for the German Library. Pilot study
[BMFT-FB-ID-80-015] N82-13009

INFRARED ABSORPTION
The extinction by small aluminum particles from the far infrared to the vacuum ultraviolet N82-12960

INFRARED ASTRONOMY
Infrared spectroscopy of microorganisms near 3.4 microns in relation to geology and astronomy
[PREPRINT-69] N82-12713

INFRARED DETECTORS
Evaluation of active and passive near-millimeter-wave radiometric imaging techniques for detection of concealed objects
[DE81-031936] N82-12316

INFRARED LASERS
Construction and characteristics of an optically pumped FIR-LMR spectrometer -- far infrared (FIR) laser magnetic resonance (LMR) spectrometer
[MPIS-18/1980] N82-12438

INFRARED RADIATION
Advanced combustion/plume diagnostics
[AD-A105115] N82-12173

INFRARED REFLECTION
Infrared reflectance and refractive index measurements in vacuum-rated hemiellipsoidal mirror reflectometer from 20 to 300 deg K -- gas condensates on mirror surfaces
[AD-A105113] N82-12933

INFRARED SPECTRA
Infrared emission spectroscopy of low pressure gaseous discharges
[AD-A104123] N82-12180
Emission spectra from EHD contacts N82-12485

INFRARED SPECTROSCOPY
Infrared emission spectroscopy of low pressure gaseous discharges
[AD-A104123] N82-12180
Infrared spectroscopy of microorganisms near 3.4 microns in relation to geology and astronomy
[PREPRINT-69] N82-12713

INFRARED TELESCOPES
Alignment of the Cassegrain and Coude optics of the 3.8m UK infrared telescope; assessment of the optical performance and results of aberration calculations
[UKIRT-10] N82-13024
The removal, mechanical handling and installation procedures for re-aluminising the UKIRT 3.8m primary mirror -- United Kingdom Infrared Telescope (UKIRT)
[UKIRT-11] N82-13025
Metallic film thickness requirements for mirrors in the infrared -- United Kingdom infrared telescope (UKIRT)
[UKIRT-13] N82-13026
Thin mirror telescopes: Experience gained with the UK infrared telescope
[UKIRT-14] N82-13027
Computer aided balancing of UKIRT: A preliminary report -- United Kingdom Infrared Telescope (UKIRT)
[UKIRT-15] N82-13028

INJURIES
A Monte Carlo study of the use of auxiliary information in the developent of an impact acceleration injury prediction model
[AD-A105463] N82-12755

INLET FLOW
Effect of a part span variable inlet guide vane on TF34 fan performance
[NASA-CR-165468] N82-12075

INSOLATION
Environmental data for sites in the National Solar Data Network
[DE82-000071] N82-12707

INSPECTION
Guidance for implementing an environmental, safety and health assurance program. Volume 12: Model guidelines for line organization environmental, safety and health inspection and monitoring activities
[DE81-030991] N82-12888

INSTALLING
The removal, mechanical handling and installation procedures for re-aluminising the UKIRT 3.8m primary mirror -- United Kingdom Infrared Telescope (UKIRT)
[UKIRT-11] N82-13025

INSTRUMENT COMPENSATION
AFFTC standard airspeed calibration procedures
[AD-A104630] N82-12074

INSTRUMENT ERRORS
Instrument failure detection for a linear uncertain system N82-12073
Estimation of bias errors in angle-of-arrival measurements using platform motion
[AD-A104742] N82-12309

INSTRUMENT PACKAGES
Hydrophysical instrumentation and computer complex N82-12490

INSULATION
Comparison of residential window distributions and effects of mass and insulation
[DE81-027938] N82-12283

INTEGERS
Optimal integer and fractional covers: A sharp bound on their ratio
[AD-A104829] N82-12886

INTEGRAL EQUATIONS
Calculation of stationary transonic flows using the integral equation method
[REPT-374] N82-12049
Electromagnetic diffraction by a narrow slit in an impedance sheet-E-polarization
[AD-A105029] N82-12144
The numerical solution of Fredholm integral equations of the first kind N82-12843

INTEGRATED CIRCUITS
Use of on-chip redundancy for fault-tolerant very large scale integrated circuit design N82-12332
Computer-aided synthesis and design of Monolithic Microwave Integrated Circuits (MMICS) N82-12335
A systolic 2-D convolution chip
[AD-A104872] N82-12351
Ion implanted GaAs I. C. process technology
[AD-A104946] N82-12360
Integrated humidity sensor -- relative humidity of air
[BMFT-FB-T-81-007] N82-12426
New Photolithographic methods: Projection alignment for the metallization of highly integrated circuits -- alternative metallization method
[BMFT-FB-T-81-016] N82-12427
Development of MOS memories
[BMFT-FB-T-80-161] N82-12803
Selected area growth for digital integrated circuits and atomic plane doping of gallium arsenide by molecular beam epitaxy N82-12956
Study of 1/f noise in solids
[AD-A105219] N82-12966

INTELSAT 5 SATELLITE
Third Intelsat 5 satellite scheduled for launch
[NASA-NEWS-RELEASE-81-185] N82-12097

INTERFACES
PC-402 Pioneer Venus orbiter spacecraft mission operational characteristics document
[NASA-CR-166260] N82-12090
Hardware and software improvements to a paced data acquisition system for turbomachines
[AD-A104853] N82-12797

INTERFEROMETRY
Production interferometric testing of diamond-turned surfaces
[DE82-000172] N82-12937

INTERIOR BALLISTICS
Numerical computation of two phase flow in gun barrels
[HTS/81/6] N82-12413

INTERNAL COMBUSTION ENGINES
Fuel savings in hot water heating plants by application of heat pumps operated with natural gas (natural gas heat pump). Project: gas engine
[BMFT-FB-T-80-125] N82-12641

INTERNAL WAVES
An assessment of the potential contributions to oceanography from Skylab visual observations and handheld-camera photographs N82-12503
An experimental study of the propagation and dispersion of internal atmospheric gravity waves
N82-12681
Regional dependence of very low-frequency sound attenuation in the deep sound channel: Correlation with internal wave measurements
[AD-A105061] N82-12892

INTERNATIONAL MAGNETOSPHERIC STUDY
Project PORCUPINE: Magnetometer experiment
[BMFT-FB-W-80-026] N82-12709

INTERPROCESSOR COMMUNICATION
Data flow and bus structure in a loosely coupled multiprocessor computer system ARCADE
[ENST-C-81003] N82-12805
Schemes for communication -- interprocessor communication
[AD-A104791] N82-12819
Fault testing and diagnosis implementation in microprocessor controlled data networks
[ESNT-D-81001] N82-12836
A model for uncoordinated distributed computation of fixed points
[AD-A104819] N82-12850

INTRAVEHICULAR ACTIVITY
Crew activities in space N82-12129

INVENTORIES
Hardware survey for the avionics test bed
[NASA-CR-161072] N82-12796

INVENTORY CONTROLS
Dynamic programming for problems of impulse control N82-12808

INVESTIGATION
Meteorological and climatological investigation: Review of January - June 1980 investigative period
[DE81-030740] N82-12731

INVESTMENTS
Project impact analysis as an optimal control problem -- irrigation and hydroelectric power project
[DE81-028465] N82-12842

INVISCID FLOW
On Vortex breakdown and instability
[AD-A104960] N82-12048
Prediction of the incompressible flow over a rearward-facing step N82-12376

ION ACOUSTIC WAVES
Interaction of ion-acoustic solitons in multi-dimensional space, 2
[IPPJ-535] N82-12941

ION CYCLOTRON RADIATION
Design analysis of supplemental heating systems
[DE81-030678] N82-12397
Design analysis of supplemental heating systems
[DE82-030677] N82-12398
ECR discharge cleaning experiment in the JIPP T-11
[IPPJ-539] N82-12940

ION EMISSION
Description and use of the Monte Carlo code LILITA
[DE81-030704] N82-12904
Using spectral line profiles as a diagnostic of the plasma electron density
[DE81-030313] N82-12952

ION EXCHANGING
Fundamental studies in continuous annular chromatography
[DE82-000519] N82-12190
Investigation of electrochromic effects for display application
[BMFT-FB-T-80-196] N82-12366

ION EXTRACTION
Electrode design and performance of the ORNL positive ion sources
[DE81-030426] N82-12910

ION IMPLANTATION
Investigation of the electrochemical behavior of ion-implanted Ti-Pt alloys N82-12212
Ion implanted GaAs I. C. process technology
[AD-A104946] N82-12360
X-ray scattering investigation of microalloying and defect structure in ion implanted copper
[AD-A105442] N82-12967

ION SELECTIVE ELECTRODES
Applications of vibrating wire electrodes to electroanalysis N82-12148

ION SOURCES
Inductively coupled plasma as an ion source for the determination of trace elements in solutions by mass spectrometry
[DE81-030744] N82-12192
Electrode design and performance of the ORNL positive ion sources
[DE81-030426] N82-12910

IONIC COLLISIONS
The image potential and ion trajectories in SIMS
[AD-A105377] N82-12179

IONIC MOBILITY
Ion transport in charged porous media theory and experiments N82-12159

IONIC REACTIONS
Application of ion cyclotron resonance spectroscopy, photoionization mass spectrometry and photoelectron spectroscopy to study the properties and reactions of ions in gases
[DE81-030296] N82-12189

IONIZATION
The image potential and ion trajectories in SIMS
[AD-A105377] N82-12179
Effects of preionization level on a stabilized Z-pinch
[FUPH-R-164] N82-12951

IONIZED GASES
Analytical expressions for specific heats and isentropic exponents of high-temperature gases with their applications
[NAL-TR-671] N82-12984

IONIZING RADIATION
Biological effects of low doses of ionizing radiation: Three review papers
[AECL-7059] N82-12758

IONOSPHERE
Ionospheric power beam studies N82-12542

IONOSPHERIC CONDUCTIVITY
Impedance probe experiment in project Polar High Atmosphere of the Sounding Rocket Program Aeronomy
[BMFT-FB-W-80-035] N82-12710

IONOSPHERIC CURRENTS
Project PORCUPINE: Magnetometer experiment
[BMFT-FB-W-80-026] N82-12709

IONOSPHERIC DISTURBANCES
Proposed experimental studies for assessing ionospheric perturbations on SPS uplink pilot beam signal N82-12543
Ionospheric effects in active retrodirective array and mitigating system design N82-12551

IONOSPHERIC ELECTRON DENSITY
Impedance probe experiment in project Polar High Atmosphere of the Sounding Rocket Program Aeronomy
[BMFT-FB-W-80-035] N82-12710

IONOSPHERIC F-SCATTER PROPAGATION
Incoherent scatter ion line fitting package
[KGI-TR-032] N82-12321

IONOSPHERIC PROPAGATION
Ionospheric propagation correction modeling for satellite altimeters
[NASA-CR-156881] N82-12447
An experimental study of the propagation and dispersion of internal atmospheric gravity waves N82-12681

IONS
The image potential and ion trajectories in SIMS
[AD-A105377] N82-12179

IOWA
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] N82-12604

IRON
Carbon-supported iron catalysts for CO hydrogenation N82-12154

IRON COMPOUNDS
Oxydesulfurization of coal by acidic iron sulfate solutions
[DE82-000464] N82-12199
Synthesis gas conversion to liquid fuels using promoted fused iron catalysts
[DE81-030857] N82-12259
Remote sensing studies of some ironstone gravels and plinthite in Thailand N82-12491
Deep levels in Al sub x Ga sub 1 xAs:Fe single crystals
[AD-A105233] N82-12970

IRON ISOTOPES
Studies in erythropoiesis: The influence of the glycocalyx of the red cell membrane
[DE81-030888] N82-12760

IRON 59
Studies in erythropoiesis: The influence of the glycocalyx of the red cell membrane
[DE81-030888] N82-12760

IRRADIATION
Miniaturized fatigue crack growth specimen technology and results
[DE81-029757] N82-12481

IRRIGATION
Project impact analysis as an optimal control problem — irrigation and hydroelectric power project
[DE81-028465] N82-12642

ISENTROPIC PROCESSES
Analytical expressions for specific heats and isentropic exponents of high-temperature gases with their applications
[NAL-TR-671] N82-12984

ISLANDS
Mesoscale wake clouds in Skylab photographs N82-12508
Mesoscale cloud features observed from Skylab N82-12509

ISOCYANATES
Development of an air sampling and analytical method for 1,6-hexamethylene diisocyanate
[AD-A106002] N82-12659

ISOTOPE SEPARATION
Optogalvanic spectroscopy and cataphoretic laser isotope separation N82-12929

ISOTOPES
PAPIN: A FORTRAN-4 program to calculate cross section probability tables, Bondarenko and transmission self-shielding factors for fertile isotopes in the unresolved resonance region
[DE81-030436] N82-12903

ISOTROPIC MEDIA
Theory of thermoelasticity
[NASA-TM-75510] N82-12473

ITERATION
Analysis of Richardson iteration in multigrid methods for nonlinear parabolic differential equations
[MC-NW-105/81] N82-12859

ITERATIVE SOLUTION
Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164963] N82-12080
The automatic solution of Fredholm equations of the second kind
[MC-NW-99/80] N82-12855

IUE
Integrated fluxes for emission lines in the ultraviolet spectra of several planetaries
[NASA-CR-164986] N82-13022

J

JAPAN
Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Fernandian Caldera, Galapagos Islands, Ecuador N82-12496
Japanese Research Institutes funded by the Ministry of Education
[ONRT-M2] N82-13042

JET ENGINE FUELS
Determination and analysis of jet and missile fuel deposits
[AD-A105458] N82-12248
Development of catalytic systems for the conversion of syngas to jet fuel and diesel fuel and higher alcohols
[DE82-000067] N82-12255

JET EXHAUST
Thruster-exhaust-plume-impingement disturbance torque of three-axis-stabilized satellite
[NAL-TR-670] N82-12100

JET FLOW
Calculation of annular and twin parallel jets using various discretization schemes and turbulence model variants
[KU-SFB-80/T/159] N82-12383

JET IMPINGEMENT
Thruster-exhaust-plume-impingement disturbance torque of three-axis-stabilized satellite
[NAL-TR-670] N82-12100

JET STREAMS (METEOROLOGY)
Meteorological lab applications of Skylab handheld-camera photographs N82-12506

JOINING
The analysis and synthesis of interconnection networks for distributed computer systems N82-12834

JOURNAL BEARINGS
Tribology experiment — journal bearings and liquid lubricants N82-12117

JUNCTION DIODES
Measurement of pair-quasiparticle interference in Josephson tunnel junctions
[AD-A106251] N82-12972

JUPITER (PLANET)
Orbit improvement of the satellites of the outer planets
[NASA-CR-164987] N82-13037

JUPITER ATMOSPHERE
An experimental study of massive blowing from a nosetip during Jovian entry
[NASA-CR-165756] N82-12386
On the global circulation and the hurricane system of the Jovian atmosphere
[NASA-TM-83833] N82-13034

JUPITER RED SPOT
On the global circulation and the hurricane system of the Jovian atmosphere
[NASA-TM-83833] N82-13034

K

KALMAN FILTERS
Application of Kalman filtering in computer relaying of power systems N82-12338

KANSAS
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] N82-12604

KELVIN-HELMHOLTZ INSTABILITY
The Rayleigh-Taylor and Kelvin-Helmholtz instabilities in targets accelerated by laser ablation
[AD-A104804] N82-12433

KERNEL FUNCTIONS
Autoregressive spectral estimation, log spectral smoothing and entropy
[AD-A104840] N82-12849
A numerical solution for two-dimensional Fredholm integral equations of the second kind with kernels of the logarithmic potential form
[NASA-TM-81299] N82-12885

KINEMATIC EQUATIONS
A pulse-forming network for particle path visualization — at Ames Aeromechanics Water Tunnel Facility
[NASA-TM-81311] N82-12036

KINETIC ENERGY
Bremsstrahlung energy spectra from electrons of kinetic energy 1 keV less than or equal to T less than or equal to 2000 keV incident on neutral atoms 1 less than or equal to Z less than or equal to 92
[DE81-030984] N82-12952

KINETICS
An engineering study of bacterial kinetics and energetics N82-12740

KLYSTRONS
Study of the emission performance of high-power klystrons: SLAC XK-5
[DE81-030177] N82-12362
High efficiency SPS klystron design N82-12552
Analytic investigation of efficiency and performance limits in klystron amplifiers using multidimensional computer programs; multi-stage depressed collectors; and thermionic cathode life studies N82-12553

KNOWLEDGE
Knowledge-based expert systems: A brief bibliography
[AD-A104793] N82-12840

KNUDSEN FLOW
Diffusion of gases in capillaries
[DE82-000267] N82-12908

KRYPTON
Nuclear magnetic resonance studies of solid krypton N82-12961

KRYPTON ISOTOPES
Nuclear magnetic resonance studies of solid krypton N82-12961

L

LABORATORIES
Japanese Research Institutes funded by the Ministry of Education
[ONRT-M2] N82-13042

LABORATORY EQUIPMENT
Hardware survey for the avionics test bed
[NASA-CR-161072] N82-12796
LABYRINTH SEALS
Calculation and measurement of the turbulence of an incompressible flow in a labyrinth seal between a rotating shaft and a cylinder at rest
[EPFL-ITA-8] N82-12362
LAKE ICE
Visual observations of floating ice from Skylab
N82-12504
LAKES
The Manicouagan impact structure observed from Skylab
[CONTRIB-644] N82-12497
Water resources data for New York, water year 1980. Volume 1: Eastern New York excluding Long Island
[PB81-227306] N82-12534
Water resources data for New York, water year 1980. Volume 3: Western New York
[PB81-227316] N82-12535
LAMINAR BOUNDARY LAYER
Surface chemical reactions on stationary or rotating bodies in nonisothermal laminar boundary layer flows
N82-12153
HADY-I, a FORTRAN program for the compressible stability analysis of three-dimensional boundary layers — on swept and tapered wings
[NASA-CR-3467] N82-12366
LAMINAR FLOW
Tubular electrodes in flow injection analysis
N82-12149
Structure of laminar premixed flames of methane, methanol and their blends in oxygen N82-12164
Prediction of the incompressible flow over a rearward-facing step N82-12376
Observations of the effects of boundary layer and nuclei on cavitation of axisymmetric bodies
[AD-A104779] N82-12393
Laminar-flow-cyclone development program
[DE81-001297] N82-12399
Ring eddy flow metamorphosis as a basis for implosion of partial vacuums, Schwenk's drop picture method and cutting by means of a water jet
[MPIS-13/1980] N82-12401
LAMINATES
The effect of resin on the impact damage tolerance of graphite-epoxy laminates
[NASA-TM-83213] N82-12140
Biaxial tests of flat graphite/epoxy laminates
[NASA-CR-165793] N82-12141
Radio shack TRS-80 pocket computer solutions to composite materials formulas
[AD-A105173] N82-12145
LAND ICE
Effects of volcanism on the glaciers of Mount St. Helens
[USGS-CIRC-850-D] N82-12669
LAND MOBILE SATELLITE SERVICE
Combined report number 22. SATNET development and operation, Pluribus Satellite IMP development, remote site maintenance, internet development, mobile access terminal network, TCP for the HP3000, TCP-TAC, TCP for VAX-UNIX
[AD-A104931] N82-12313
LAND USE
Cultural features imaged and observed from Skylab 4 N82-12499
Vegetation patterns N82-12500
Report on Skylab 4 African drought and arid land experiment N82-12501
A land use decision methodology for mine lands in Appalachia
[PB81-220113] N82-12676
LANDFILLS
Evaluation of landfill gas as an energy source — feasibility of methane recovery from landfills
[DE82-300116] N82-12684
LANDING SIMULATION
Pilot estimates of glidepath and aim point during simulated landing approaches
[NASA-TM-81325] N82-12772
LANDING SITES
Pilot estimates of glidepath and aim point during simulated landing approaches
[NASA-TM-81325] N82-12772
LANGUAGE PROGRAMMING
SISU: A programming language for computational linguistics, with an application to the analysis of Finnish N82-12809
LAP JOINTS
The behavior and strength of lapped splices in reinforced concrete beams subjected to cyclic loading N82-12470
LAPLACE TRANSFORMATION
The rigid shell component for superrotation in planetary atmospheres: Angular momentum budget, mechanical analog and simulation of the spin up process
[NASA-TM-83831] N82-13033
LARGE SCALE INTEGRATION
Use of on-chip redundancy for fault-tolerant very large scale integrated circuit design N82-12332
New Photolithographic methods: Projection alignment for the metallization of highly integrated circuits — alternative metallization method
[BMFT-FB-T-81-018] N82-12427
LARGE SPACE STRUCTURES
Shuttle considerations for the design of large space structures
[NASA-CR-160861] N82-12091
Space Construction Experiment Definition Study (SCEDS), part 1. Volume 1: Executive summary
[NASA-CR-167456] N82-12094
Space Construction Experiment Definition Study (SCEDS), part 1. Volume 2: Study results
[NASA-CR-167432] N82-12095
The dynamics and control of large flexible space structures
[NASA-CR-164962] N82-12096
Critical requirements for the design of large space structures
[NASA-CR-3484] N82-12131
Hardware survey for the avionics test bed
[NASA-CR-161072] N82-12796
LASER APPLICATIONS
Application of the three beam laser cross correlation technique in the exhaust plume of a liquid fuelled rocket motor
[AASU-343] N82-12134
Pyrolysis of coal-drived fuels using the laser-powered homogeneous pyrolysis technique
[DE82-000251] N82-12196
Optogalvanic spectroscopy and cataphoretic laser isotope seperation N82-12929
Production interferometric testing of diamond-turned surfaces
[DE82-000172] N82-12937
LASER DOPPLER VELOCIMETERS
Lateral migration of neutrally buoyant rigid spheres in small ducts — capillary blood flow
[MPIS-20/1980] N82-12406
LASER FUSION
Phoenix 2 energy extraction and angular multiplexing experiments — laser fusion reactors
[DE81-028972] N82-12919
Inertial fusion program
[DE81-030512] N82-12954
LASER OUTPUTS
A new power meter concept for high energy lasers
[AD-A104824] N82-12432
Phoenix 2 energy extraction and angular multiplexing experiments — laser fusion reactors
[DE81-028972] N82-12919
LASER PLASMAS
Stabilization of Rayleigh-Taylor instability due to the spontaneous magnetic field in laser produced plasma
[IPPJ-537] N82-12942
LASER PUMPING
Intense proton beam excitation of a high pressure argon-nitrogen laser N82-12430
LASER SPECTROMETERS
Construction and characteristics of an optically pumped FIR-LMR spectrometer — far infrared (FIR) laser magnetic resonance (LMR) spectrometer
[MPIS-16/1980] N82-12436
LASER SPECTROSCOPY
Laser excited Shpol'skii spectroscopy for the selective excitation and determination of polynuclear aromatic hydrocarbons N82-12151
LASER TARGET INTERACTIONS
The Rayleigh-Taylor and Kelvin-Helmholtz instabilities in targets accelerated by laser ablation
[AD-A104804] N82-12433
LASERS
Studies of optical-beam phase-conjugation by nonlinear refraction
[AD-A105066] N82-12435
LATERAL CONTROL
Research developing closed loop roll control for magnetic balance systems
[NASA-CR-164969] N82-12084
LATITUDE MEASUREMENT
Determination of geographic longitudes, latitudes and azimuths with the transit instrument AP in the test grid Weetherz
[SER-B-249] N82-12532
LAUE METHOD
Automated X-ray orientation for quartz crystal resonators
[AD-A104945] N82-12977
LAUNCH DATES
Third Intelsat 5 satellite scheduled for launch
[NASA-NEWS-RELEASE-81-185] N82-12097
LAUNCH VEHICLES
Use of SKW-9 single launch vehicle for three satellites described N82-12105
LAW (JURISPRUDENCE)
The structure of information policy N82-12994
Constitutional rights N82-13000
LAWS
Photovoltaic market analysis program: Background, model development, applications and extensions
[DE81-029711] N82-12609
LEACHING
Assessment of water supply contamination dual to underground coal gasification
[PB81-209215] N82-12680
LEAD ALLOYS
Comments on the hydrogen solubility data for liquid lead, lithium and lithium-lead alloys and review of a tritium-solubility model for lithium-lead alloys — tritium breeding blanket
[DE81-030828] N82-12220
LEAKAGE
The effect of optically enhanced leakage current on S-band TRAPATT diode oscillators N82-12342
Monitor for detecting nuclear waste leakage in a subsurface repository
[DE81-026429] N82-12927
LENGTH
Cable-length-measurement system — CHIRP technique and Doppler effect
[DE81-030015] N82-12421
LENS DESIGN
Electrostatic lenses of the antisymmetric quadrupole and symmetric octupole quadruplet N82-12343
LENSES
The uniqueness of phase retrieval from intensity measurements
[AD-A105166] N82-12934
LIFT
The response and the lift force analysis of a cylinder oscillating in still water N82-12464
LIGHT (VISIBLE RADIATION)
A study of galactic light, extragalactic light, and galactic structure using Pioneer 10 observations of background starlight N82-13040
LIGHT BEAMS
Studies of optical-beam phase-conjugation by nonlinear refraction
[AD-A105066] N82-12435
LIGHT EMISSION
A pulse-forming network for particle path visualization — at Ames Aeromechanics Water Tunnel Facility
[NASA-TM-81311] N82-12036
LIGHT EMITTING DIODES
Blue light emitting luminescent diodes of silicon carbide — fabrication
[BMFT-FB-T-81-010] N82-12368
LIGHTNING
Investigation of severe lightning strike incidents to two USAF F-106A aircraft
[NASA-CR-165794] N82-12052
LIKELIHOOD RATIO
Log odds ratio estimation in a grouped population
N82-12865
LIMITERS (FUSION REACTORS)
Novel limiter pump topologies
[DE81-030029] N82-12947
LINEAR ACCELERATORS
ORELA electron guns
[DE81-030703] N82-12923
LINEAR EQUATIONS
Numerical experiments for solving symmetric hyperbolic systems with discontinous initial data
N82-12792

LINEAR PREDICTION
Phonematic recognition by linear prediction: Experiment
[ENST-C-81001] N82-12323
LINEAR PROGRAMMING
Modelling energy-economic interactions in developing countries: A linear-programming approach
[DE81-026046] N82-12637
LINEAR SYSTEMS
Instrument failure detection for a linear uncertain system N82-12073
Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164963] N82-12080
Optimal adaptive stochastic control of linear dynamical systems with multiplicative and additive noise N82-12866
LINES (GEOMETRY)
How a digital computer can tell that a straight line is straight
[AD-A105076] N82-12246
LINGUISTICS
SISU: A programming language for computational linguistics, with an application to the analysis of Finnish N82-12809
LIQUID ALLOYS
Gravitational influence on binary alloy melt equilibria and eutectic solidification N82-12215
LIQUID CHROMATOGRAPHY
Development of an air sampling and analytical method for 1,6-hexamethylene diisocyanate
[AD-A105002] N82-12659
LIQUID CRYSTALS
Anisotropic and electro-optical effects in liquid crystals
[AD-A105189] N82-12936
Electro-optical effects in liquid crystals for display use
[BMFT-FB-T-80-200] N82-12981
LIQUID FLOW
Two-phase flow and heat transfer under low gravity N82-12116
Self-induced pulsating liquid flow in a hydraulic syutem
[MPIS-15/1980] N82-12414
Formation evaluation in liquid-dominated geothermal reservoirs
[DOE/ET-28384/T1] N82-12514
LIQUID HELIUM 2
Dynamics of superfluid helium in zero gravity --- Spacelab 2 investigation N82-12111
LIQUID METALS
Comments on the hydrogen solubility data for liquid lead, lithium and lithium-lead alloys and review of a tritium-solubility model for lithium-lead alloys --- tritium breeding blanket
[DE81-030828] N82-12220
LIQUID PHASE EPITAXY
Blue light emitting luminescent diodes of silicon carbide --- fabrication
[BMFT-FB-T-81-010] N82-12368
LIQUID ROCKET PROPELLANTS
Determination and analysis of jet and missile fuel deposits
[AD-A105458] N82-12248
LIQUID WASTES
Solvent extraction studies using high-molecular-weight amines
[DE81-030081] N82-12191
Process for the denitrification of high-level radioactive liquid wastes
[DE81-026875] N82-12925
LIQUID-LIQUID INTERFACES
Propagation of a liquid-liquid explosion
[DE81-030780] N82-12252
LIQUID-VAPOR EQUILIBRIUM
Defining critical point experiments for a space laboratory N82-12110
Correlation and prediction of vapor-liquid equilibrium in electrolytic solutions N82-12157
LIQUIDS
The gravity wave in a liquid with a surface film, in the presence of an applied electric field
[REPT-80-2] N82-12408
LISTS
Worldwide directory of national Earth-science agencies and related international organizations
[USGS-CIRC-834] N82-12487
LITHIUM ALLOYS
Comments on the hydrogen solubility data for liquid lead, lithium and lithium-lead alloys and review of a tritium-solubility model for lithium-lead alloys --- tritium breeding blanket
[DE81-030828] N82-12220
LITHIUM COMPOUNDS
Electrolytes for rechargeable lithium batteries
[AD-A105230] N82-12677
LITHOLOGY
Formation evaluation in liquid-dominated geothermal reservoirs
[DOE/ET-28384/T1] N82-12514
The Arrinthrunga formation: Upper Cambrian epeiric carbonates in the Georgina Basin, central Australia
[BMR-BULL-211] N82-12686
LOAD TESTS
Vibration test procedures for accessory angle drive gearboxes on Atar 09C engines --- turbojet engines
[AD-A105269] N82-12076
LOADS (FORCES)
Elastic-plastic thick-walled tubes subjected to internal pressure and temperature gradient
[AD-A105243] N82-12477
LOGARITHMS
Log odds ratio estimation in a grouped population N82-12865
A numerical solution for two-dimensional Fredholm integral equations of the second kind with kernels of the logarithmic potential form
[NASA-TM-81299] N82-12865
LOGIC CIRCUITS
Efficient implementations of multicounter machines for oblivious Turing machines, acyclic logic networks, and VLSI
[MC-IW-167/81] N82-12806
LOGIC DESIGN
SCALD 2 logic simulator
[DE81-030679] N82-12827
LONGITUDE MEASUREMENT
Determination of geographic longitudes, latitudes and azimuths with the transit instrument AP in the test grid Westharz
[SER-B-249] N82-12532
LOOP ANTENNAS
Formulation of a dynamic analysis method for a generic family of hoop-mast antenna systems
[NASA-CR-164981] N82-12300
LOOPS
The magnetostatic force produced by current loops and is medical applications N82-12748
LORAN C
Flight evaluation of LORAN-C as a helicopter navigation aid in the Baltimore Canyon oil exploration area
[AD-A105260] N82-12059
Design study report for General Aviation Loran-C receiver
[AD-A104921] N82-12062
LOSSY MEDIA
Computer-aided synthesis and design of Monolithic Microwave Integrated Circuits (MMICS) N82-12335
LOUDSPEAKERS
Effect of the orientation of the speaker's head and azimuth of a noise source on the speech reception threshold for sentences
[IZF-1980-18] N82-12896
LUBRICANT TESTS
Lubrication during drawing: Bibliographical analysis and results, volume 1 --- lubricant tests for a metal forming process
[CETIM-13-Y-152-VOL-1] N82-12456
LUBRICANTS
Tribology experiment --- journal bearings and liquid lubricants N82-12117
LUBRICATING OILS
Study of foaming characteristics and foaming under pressure: Deaerating lubricants and the influence of antifoaming additives
[CETIM-1.2E.12.3-PT-5] N82-12455
LUBRICATION
Lubrication during drawing: Bibliographical analysis and results, volume 1 --- lubricant tests for a metal forming process
[CETIM-13-Y-152-VOL-1] N82-12456
LUMPED PARAMETER SYSTEMS
Generalized study of a hydraulically actuated mechanism system N82-12375

M

MACH NUMBER
Description and calibration of the Langley unitary plan wind tunnel
[NASA-TP-1905] N82-12035
MACHINE ORIENTED LANGUAGES
Design and construction of a virtual machine resource binding language N82-12812
MACHINE TOOLS
Control systems improvements in a precision coordinate measuring machine
[DE82-000024] N82-12281
Cutting tool coatings program
[DE81-026269] N82-12449
MACHINE-INDEPENDENT PROGRAMS
Design and construction of a virtual machine resource binding language N82-12812
MAGNESIUM OXIDES
Fracture of magnesium aluminate spinel N82-12213
MAGNETIC COMPRESSION
Axial translation of field-reversing relativistic electron rings N82-12915
MAGNETIC COOLING
Materials for magnetic refrigeration between 2 and 20 K
[DE81-024031] N82-12284
MAGNETIC DISKS
Video discs: Their application to information storage and retrieval
[NRCD-12] N82-13006
MAGNETIC DISPERSION
Selective separation of coal feedstocks for conversion by magnetic separation techniques
[DE81-026060] N82-12263
MAGNETIC DOMAINS
Elastic domain wall waves in ferroelectric ceramics and single crystals
[AD-A105110] N82-12971
MAGNETIC FIELD CONFIGURATIONS
High-mode-number MHD stability of a toroidal multipole
[DE81-030484] N82-12950
Plasma research laboratory report, 1979
[INIS-MF-6067] N82-12955
MAGNETIC FIELDS
Stabilization of Rayleigh-Taylor instability due to the spontaneous magnetic field in laser produced plasma
[IPPJ-537] N82-12942
Matter accreting neutron stars
[NASA-TM-83835] N82-13031
MAGNETIC LENSES
Electrostatic lenses of the antisymmetric quadrupole and symmetric octupole quadruplet N82-12343
MAGNETIC MATERIALS
Fundamentals of magnetic interactions: New approaches to theory and experiment
[AD-A105003] N82-12887
MAGNETIC POLES
Danish Meteorological Institute, Rude Skov, Geophysical Observatory. Magnetic results
[ISBN-87-7478-187-1] N82-12712
MAGNETIC SURVEYS
Geophysical survey, Paso Robles geothermal area, California, part of the resource assessment of low- and moderate-temperature geothermal resource areas in California
[DE81-026038] N82-12517
MAGNETIC SUSPENSION
Research developing closed loop roll control for magnetic balance systems
[NASA-CR-164969] N82-12084
Selective separation of coal feedstocks for conversion by magnetic separation techniques
[DE81-026060] N82-12263
MAGNETIZATION
Fundamentals of magnetic interactions: New approaches to theory and experiment
[AD-A105003] N82-12887
MAGNETOHYDRODYNAMIC GENERATORS
Magnetohydrodynamics (MHD) Engineering Test Facility (ETF) 200 MWe power plant. Design Requirements Document (DRD)
[NASA-TM-82705] N82-12446

Magnetohydrodynamics (MHD) Engineering Test Facility (ETF) 200 MWe power plant. Conceptual Design Engineering Report (CDER). Volume 1: Executive summary
[NASA-CR-165452-VOL-1] N82-12570
End region and current consolidation effects upon the performance of an MHD channel for the ETF conceptual design
[NASA-TM-82744] N82-12943

MAGNETOHYDRODYNAMIC STABILITY
Disruption of high beta plasma induced by resistive drift mode
[IPPJ-538] N82-12939
Comparison of results between the ballooning modes codes BLOON and BALOON
[DE81-030259] N82-12949
High-mode-number MHD stability of a toroidal multipole
[DE81-030484] N82-12950

MAGNETOSPHERIC ELECTRON DENSITY
Project PORCUPINE: Magnetometer experiment
[BMFT-FB-W-80-026] N82-12709

MAGNETOSTATICS
The magnetostatic force produced by current loops and is medical applications N82-12748

MAGNETRONS
The adapting of the crossed-field directional amplifier to the requirements of the SPS N82-12564

MAINE
Peat resource evaluation: State of Maine
[DE82-000227] N82-12523

MAN ENVIRONMENT INTERACTIONS
Cultural features imaged and observed from Skylab 4 N82-12499

MAN MACHINE SYSTEMS
Guidance for implementing an environmental, safety and health assurance program. Volume 12: Model guidelines for line organization environmental, safety and health inspection and monitoring activities
[DE81-030891] N82-12888
Guidance for implementing an environmental, safety and health assurance program. Volume 13: Model guidelines for line organization environmental, safety and health meetings
[DE81-030880] N82-12889
Human control and regulation tasks N82-12787
SENORSY: A formalized instrument for the user oriented revision of dp-systems
[BMFT-FB-DV-81-001] N82-12804
Knowledge-based expert systems: A brief bibliography
[AD-A104793] N82-12840

MANAGEMENT ANALYSIS
Analysis report: Applied analysis model summaries
[DE81-029278] N82-12526

MANAGEMENT PLANNING
An approach to the management of hazardous materials
[AD-A104869] N82-12987

MANUAL CONTROL
Cybernetics and car driving: A mathematical (computer) model for the system to be controlled
[IZF-1980-4] N82-12775
Levels of steering control: Reproduction of steering wheel movements
[IZF-1980-16] N82-12777
Cybernetics and car driving: Perspective perception and the output vector of the system to be controlled
[IZF-1980-19] N82-12778
Human control and regulation tasks N82-12787

MANUFACTURING
Manufacturing and cost evaluation of second generation heliostats. Volume 2: Appendices
[DE82-000232] N82-12617

MAPPING
Peat resource evaluation: State of Maine
[DE82-000227] N82-12523
Interactive computer methods for generating mineral-resource maps
[CIRC-815] N82-12527
Military geodesy and geospace science, unit two
[AD-A106071] N82-12703

MARINE BIOLOGY
Modelling as a tool — in biology
[PUBL-252] N82-12488
Policy and support for research in marine life sciences N82-12651

MARINE CHEMISTRY
Chemical and geochemical studies off the coast of Washington
[DE81-030319] N82-12513

MARINE ENVIRONMENTS
Biogeochemical studies of technetium in marine and estuarine ecosystems
[DE81-030326] N82-12672

MARINE PROPULSION
Electrical machines with superconducting windings. Part 3: Homopolar dc machines — with rotating liquid metal contacts
[BMFT-FB-T-81-015-PT-3] N82-12369

MARINE RESOURCES
Maritime support for ocean-resources development
[AD-A104730] N82-12735

MARINE TECHNOLOGY
Survey of nickel-aluminium-bronze casting alloys on marine applications
[AD-A105263] N82-12218
Maritime support for ocean-resources development
[AD-A104730] N82-12735

MARKET RESEARCH
Assessment of potential future markets for the production of hydrogen from water
[BMFT-FB-T-81-012] N82-12266
Method for estimating technological penetration rates in commercial automobile fleets
[DE82-000433] N82-13015

MARKETING
Solar thermal central receivers for industrial process heat generation: User views and recommendations for commercialization
[DE81-029811] N82-12618

MARKOV CHAINS
The queueing delay problem in multiple access schemes N82-12838

MASS FLOW
Density-measurement studies at the BI-GAS pilot plant
[DE82-000910] N82-12262
Time-of-flight spectroscopy of molecular structure, collision processes and gas-surface interactions
[AD-A105436] N82-12898

MASS SPECTROSCOPY
Secondary ion mass spectrometric image depth profiling for three-dimensional elemental analysis
[AD-A106092] N82-12172
The image potential and ion trajectories in SIMS
[AD-A105377] N82-12179

MASS TRANSFER
Impedance and mass transport kinetics of nickel cadmium cells
[AD-A105320] N82-12576

MATERIAL BALANCE
Hydrologic studies support, INTERCOMP code conversion
[DE81-030316] N82-12515

MATERIALS HANDLING
The handling, hazards, and maintenance of heavy liquids in the geologic laboratory
[USGS-CIRC-827] N82-12273
Liquid immersion apparatus for minute articles
[NASA-CASE-MFS-25363-1] N82-12441
Extensible bridge-conveyor concept development
[DE81-031973] N82-12519
Acoustic system for material transport
[NASA-CASE-NPO-15453-1] N82-12869

MATERIALS RECOVERY
Development of a process for recovery of valuable components from complex hydrodesulfurization catalysts especially tungsten, molybdenum, vanadium, nickel and cobalt
[BMFT-FB-T-80-166] N82-12204
Thermal processing of used catalysts
[BMFT-FB-T-80-169] N82-12205
The handling, hazards, and maintenance of heavy liquids in the geologic laboratory
[USGS-CIRC-827] N82-12273
Is spent fuel or waste from reprocessed spent fuel simpler to dispose of?
[EMD-81-78] N82-12917

MATHEMATICAL LOGIC
Two theorems about the completeness of Hoare's logic
[MC-IW-165/81] N82-12862

MATHEMATICAL MODELS
Investigation of the structural degradation and personnel hazards resulting from helicopter composite structures exposed to fires and/or explosions
[AD-A104757] N82-12057
The effect of visual information on manual approach and landing
[NLR-MP-80019-U] N82-12064
Mathematical models and digital simulation of hydraulic constant speed drive units for aircraft electrical supply systems, volume 1
[TT-8102-VOL-1] N82-12071
Separation via multi-column pH parametric pumping N82-12156
Assessment of pulverized-coal-fired combustor performance
[DE81-030660] N82-12187
Effects of preignition on pulverized coal combustion
[DE81-030170] N82-12195
Investigation of factors affecting the in-situ combustion retorting of oil shale
[DE82-000482] N82-12200
A non-linear model for low velocity underwater explosions N82-12235
Modelling of soil-structure interaction by finite and infinite elements
[PB81-229270] N82-12287
Generalized study of a hydraulically actuated mechanism system N82-12375
Calculation of annular and twin parallel jets using various discretization schemes and turbulence model variants
[KU-SFB-80/T/159] N82-12383
Numerical computation of two phase flow in gun barrels
[HTS/81/6] N82-12413
Modeling as a tool — in biology
[PUBL-252] N82-12488
Analysis report: Applied analysis model summaries
[DE81-029278] N82-12526
The history of the development of the rectenna N82-12560
A theoretical study of microwave beam absorption by a rectenna N82-12563
Impact of fuel-economy shortfall: Trends in technology-weighted EPA versus on-road MPG. Periodic analysis memorandum no. 1
[DE81-030641] N82-12667
Three dimensional simulation model MODIS for the propagation of air pollutants
[GKSS-80-E-56] N82-12677
Medical diagnostic application of radiofrequency range electromagnetic waves N82-12746
A Monte Carlo study of the use of auxiliary information in the developent of an impact acceleration injury prediction model
[AD-A105463] N82-12755
Measurement of gonadal and bone-marrow doses from dental radiography
[ARL/TR-022] N82-12761
Cybernetics and car driving: A driver model and its experimental validation
[IZF-1980-13] N82-12776
Project impact analysis as an optimal control problem — irrigation and hydroelectric power project
[DE81-026465] N82-12842
Simulation of the thermal behavior of an object and its nearby surroundings
[PHL-1980-06] N82-12863
Numerical techniques in linear duct acoustics, 1980-81 update
[NASA-TM-82730] N82-12890
Simple-power-balance model for microwave heating in EBT
[DE81-030426] N82-12953
Matter accreting neutron stars
[NASA-TM-83835] N82-13031

MATRICES (MATHEMATICS)
Verification of an acoustic transmission matrix analysis of sound propagation in a variable area duct without flow
[NASA-TM-82741] N82-12891

MATRIX MATERIALS
Survey of matrix materials for solidified radioactive high-level waste
[DE82-000706] N82-12922

MATTER (PHYSICS)
Collective effects in diffuse ambiplasma N82-12983
Instanton effects in the equation of state for dense neutron star matter
[HU-TFT-79-19] N82-13023

MAXIMUM ENTROPY METHOD
Autoregressive spectral estimation, log spectral smoothing and entropy
[AD-A104940] N82-12849

MAXIMUM LIKELIHOOD ESTIMATES
Fitting of negative binomial distributions using the APL program GRPFITNEG
[A-79-ST-44-24] N82-12880

MEAN
Variances for adaptive trimmed means
[AD-A104913] N82-12876

MEASUREMENT
Thermotransport of hydrogen and deuterium in vanadium, niobium and tantalum alloys N82-12208

MEASURING INSTRUMENTS
Laser systems for the Combustion Research Facility: Orion
[DE81-030989] N82-12437

MECHANICAL DRIVES
Mathematical models and digital simulation of hydraulic constant speed drive units for aircraft electrical supply systems, volume 1
[TT-8102-VOL-1] N82-12071
Ball bearing evaluation for a high precision radiometer mirror drive
[ESA-(ESTL)47] N82-12458

MECHANICAL OSCILLATORS
Qualification vibration test report for SD 802 materials experiment
[AD-A105321] N82-12132

MECHANICAL PROPERTIES
Qualification vibration test report for SD 802 materials experiment
[AD-A105321] N82-12132
Metals and ceramics division materials science program
[DE81-030697] N82-12137
Strength evaluation test of hot-pressed silicon nitride at room temperature
[NAL-TR-676] N82-12138
Mechanical properties of titanium castings
[DE81-030693] N82-12222
The effect of pressure on the physical and mechanical properties of Solithane 113 elastomer N82-12229
Materials for magnetic refrigeration between 2 and 20 K
[DE81-024031] N82-12264
Glass-mat-reinforced thermoplastic: Strong, easy to work N82-12646
Deep anistropic shell program for tire analysis
[NASA-CR-3483] N82-12845

MEDICAL ELECTRONICS
The magnetostatic force produced by current loops and is medical applications N82-12748

MEDICAL EQUIPMENT
Biomedical technology transfer. Applications of NASA science and technology
[NASA-CR-164991] N82-13012

MEDICAL SCIENCE
Compilation of cell data bank for automation in diagnostic cytology
[BMFT-FB-T-80-158] N82-12742
Inventory of medical technological research in the Netherlands N82-12767

MELTING POINTS
Liquidus temperatures of commercial ESR slags
[AD-A105268] N82-12217

MELTS (CRYSTAL GROWTH)
Gravitational influence on binary alloy melt equilibria and eutectic solidification N82-12215

MEMBRANE STRUCTURES
Formulation of a dynamic analysis method for a generic family of hoop-mast antenna systems
[NASA-CR-164961] N82-12300
Test progress on the electrostatic membrane reflector
[NASA-CR-165792] N82-12472

MERCURY (METAL)
Solvent extraction studies using high-molecular-weight amines
[DE81-030061] N82-12191

MERCURY CADMIUM TELLURIDES
Transient and diffusion analysis of Hg Cd Te
[NASA-CR-161524] N82-12984

MERCURY ION ENGINES
Retrofit and acceptance test of 30-cm ion thrusters
[NASA-CR-165259] N82-12133

MESOSCALE PHENOMENA
Mesoscale wake clouds in Skylab photographs N82-12508
Mesoscale cloud features observed from Skylab N82-12509

MESSAGE PROCESSING
A preview of act 1
[AD-A104964] N82-12824

METAL BONDING
Advanced cooling full-scale engine demonstration
[DE81-904253] N82-12452

METAL COATINGS
Progress in protective coatings for aircraft gas turbines: A Review of NASA sponsored research
[NASA-TM-82740] N82-12216

METAL CRYSTALS
Acoustic emission of plastic flow in metals and alloys N82-12209
Experimental investigation of the influence of high power ultrasound on metals N82-12211
A phenomenological theory for predicting the temperature dependence of elastic compliance in simple proper ferroelectric tungstenbronzes N82-12214
Characterization of as-grown dislocation structure in niobium by X-ray diffraction topography
[AD-A105431] N82-12969

METAL DRAWING
Lubrication during drawing: Bibliographical analysis and results, volume 1 — lubricant tests for a metal forming process
[CETIM-13-Y-152-VOL-1] N82-12456

METAL FATIGUE
Fatigue phenomena in copper
[RISO-M2241] N82-12225

METAL FILMS
Silver films for solid state bonding
[DE82-000414] N82-12223
Study of 1/f noise in solids
[AD-A105219] N82-12986
Metallic film thickness requirements for mirrors in the infrared — United Kingdom infrared telescope (UKIRT)
[UKIRT-13] N82-13026

METAL FINISHING
The use of metal finishing in aircraft fuel systems N82-12077

METAL IONS
Assessment of water supply contamination due to underground coal gasification
[PB81-20[illegible]215] N82-12680

METAL MATRIX COMPOSITES
Microstructure formation in the Au-SiO2 cermet during annealing N82-12227

METAL OXIDE SEMICONDUCTORS
Hydrogen and hydrocarbon absorption and desorption in sensors with transition metal gates on MOS capacitors N82-12331
Use of on-chip redundancy for fault-tolerant very large scale integrated circuit design N82-12332
Development of MOS memories
[BMFT-FB-T-80-161] N82-12803

METAL OXIDES
Electrocatalysis at oxide-covered metal electrodes
[DE81-027650] N82-12202
Ceramic microstructure development
[AD-A105364] N82-12233

METAL SHEETS
The influence of deformation mode during cold forming on the post-formed flow and fracture behavior of low carbon and high strength low alloy steel sheets N82-12207

METAL SURFACES
Metal-finishing processes: Surface-finish improvement
[DE81-030186] N82-12275

METAL-METAL BONDING
Silver films for solid state bonding
[DE82-000414] N82-12223

METAL-WATER REACTIONS
Substituting copper alloy tubes in old sea water condensers
[VTT-87] N82-12226

METALLIZING
New Photolithographic methods: Projection alignment for the metallization of highly integrated circuits — alternative metallization method
[BMFT-FB-T-81-018] N82-12427

METALS
Metals and ceramics division materials science program
[DE81-030697] N82-12137
Impurity resistance in ferromagnetic metals N82-12963

METAMORPHISM (GEOLOGY)
Behavioral predictions of compacted embankments on rigid foundations — in the Republic of Gabon N82-12271

METEORITE CRATERS
The Manicouagan impact structure observed from Skylab
[CONTRIB-544] N82-12497

METEOROLOGICAL CHARTS
The ice conditions in the Greenland waters
[ISBN-87-7478-183-9] N82-12533

METEOROLOGICAL INSTRUMENTS
Integrated humidity sensor — relative humidity of air
[BMFT-FB-T-81-007] N82-12426

METEOROLOGICAL PARAMETERS
Radiation budget measurement/model interface research
[NASA-CR-165000] N82-12699
Environmental data for sites in the National Solar Data Network
[DE82-000071] N82-12707
Adverse weather and night capability: A call for action. Volume 2: Appendix, data base for selected important military locations
[AD-A104991] N82-12726
Meteorological and climatological investigation: Review of January - June 1980 investigative report, volume 1
[DE81-030741] N82-12729
Meteorological and climatological investigation: Review of January - June 1980 investigative period, volume 2
[DE81-030742] N82-12730

METEOROLOGICAL SERVICES
Columbus, Ohio, Voice response system demonstration and evaluation
[AD-A104750] N82-12304

METEOROLOGY
Meteorological lab applications of Skylab handheld-camera photographs N82-12506
Meteorological and climatological investigation: Review of January - June 1980 investigative period
[DE81-030740] N82-12731

METEOSAT SATELLITE
Overall economic impact of an operational Meteosat system
[ESA-CR(P)-1457] N82-13010

METHANATION
Coprecipitated nickel-alumina methanation catalysts N82-12169

METHANE
Structure of laminar premixed flames of methane, methanol and their blends in oxygen N82-12164
Microbial methane fermentation kinetics for toxicant exposure
[AD-A104868] N82-12243
State of the art of methane gas enhancement in landfills
[DE82-000155] N82-12253
Evaluation of landfill gas as an energy source — feasibility of methane recovery from landfills
[DE82-000116] N82-12584
Design, construction, and operation of a full scale experimental anaerobic fermentation facility
[DE81-029028] N82-12605

METHOD OF CHARACTERISTICS
Three dimensional flow investigation with a method of characteristics in the inlet region and the blade-to-blade channels of supersonic axial compressors
[ESA-TT-637] N82-12078
The problem of axially symmetric flow of ideal rigid-plastic Huber-Mises medium without any specific hypotheses
[ISSN-0208-5658] N82-12463

METHYL ALCOHOLS
Correlation and prediction of vapor-liquid equilibrium in electrolytic solutions N82-12157

Supercritical multicomponent solvent coal extraction
[NASA-CASE-NPO-15767-1] N82-12241
Project for reliability fleet testing of alcohol/gasoline blends
[DE82-000004] N82-12250

MEXICO
Geological features of southwestern North America N82-12495

MICHIGAN
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] N82-12604
Terminal forecast reference notebook, detachment 12, 15th weather squadron for Selfridge Air National Guard Base, Michigan
[AD-A105083] N82-12727

MICROANALYSIS
Secondary ion mass spectrometric image depth profiling for three-dimensional elemental analysis
[AD-A105092] N82-12172

MICROBIOLOGY
An engineering study of bacterial kinetics and energetics N82-12740

MICROORGANISMS
Interactive model to assess economics of anaerobic digestion of the farm
[DE82-000452] N82-12620
Infrared spectroscopy of microorganisms near 3.4 microns in relation to geology and astronomy
[PREPRINT-69] N82-12713

MICROPOROSITY
Significance of micropores in estimating adsorption properties of activated carbon
[VTT-39] N82-12147

MICROPROCESSORS
Development of microprocessor compatible sensors — pressure sensors
[BMFT-FB-T-80-197] N82-12365
Evaluation of microprocessors for process control applications N82-12607
Fault testing and diagnosis implementation in microprocessor controlled data networks
[ESNT-D-81001] N82-12636

MICROPROGRAMMING
Design and construction of a virtual machine resource binding language N82-12812

MICROSTRUCTURE
Structure: Property relationships in gold based sliding electrical contact materials N82-12210
A fundamental study of fatigue in powder metallurgy aluminum alloys
[AD-A105080] N82-12219
Microstructure formation in the Au-SiO2 cermet during annealing N82-12227
Ceramic microstructure development
[AD-A105364] N82-12233
Investigation of electrochromic effects for display application
[BMFT-FB-T-80-196] N82-12366
X-ray scattering investigation of microalloying and defect structure in ion implanted copper
[AD-A105442] N82-12967

MICROWAVE ANTENNAS
Microwave transversal equalizer. Open loop adaptive computer control techniques
[AD-A105005] N82-12356

MICROWAVE ATTENUATION
Handbook for the estimation of microwave propagation effects: Link calculations for earth-space paths (path loss and noise estimation)
[NASA-CR-165002] N82-12301

MICROWAVE CIRCUITS
Computer-aided synthesis and design of Monolithic Microwave Integrated Circuits (MMICS) N82-12335

MICROWAVE EMISSION
Progress in radar snow research — Brookings, South Dakota
[NASA-CR-166709] N82-12510

MICROWAVE EQUIPMENT
The adapting of the crossed-field directional amplifier to the requirements of the SPS N82-12554

MICROWAVE FREQUENCIES
Nonuniformly doped gallium arsenide microwave power MESFETs N82-12337

MICROWAVE HOLOGRAPHY
Holographic study of impact phenomena — airgun pellets on ceramic targets
[TPD-1980-0-3] N82-12429

MICROWAVE LANDING SYSTEMS
MLS performance assessment, task 4. Volume 1: Evaluation procedures and equipment design
[AD-A105393] N82-12061

MICROWAVE OSCILLATORS
S-Band Shallow Bulk Acoustic Wave (SBAW) microwave source
[NASA-CR-166744] N82-12344

MICROWAVE RADIOMETERS
Microwave limb sounder — measuring trace gases in the upper atmosphere
[NASA-CASE-NPO-14544-1] N82-12685

MICROWAVE TRANSMISSION
Workshop on Microwave Power Transmission and Reception. Workshop paper summaries
[NASA-TM-84064] N82-12538
System performance conclusions N82-12539
SPS large array simulation N82-12540
An active alignment scheme for the MPTS array N82-12541
Ionospheric power beam studies N82-12542
Proposed experimental studies for assessing ionospheric perturbations on SPS uplink pilot beam signal N82-12543
Design and breadboard evaluation of the SPS reference phase control system concept N82-12545
Coherent multiple tone technique for ground based SPS phase control N82-12546
An interferometer-based phase control system N82-12547
A sonic satellite power system microwave power transmission simulator N82-12548
SPS phase control studies N82-12549
SPS fiber optic link assessment N82-12550
Ionospheric effects in active retrodirective array and mitigating system design N82-12551
High efficiency SPS klystron design N82-12552
Analytic investigation of efficiency and performance limits in klystron amplifiers using multidimensional computer programs; multi-stage depressed collectors; and thermionic cathode life studies N82-12553
The adapting of the crossed-field directional amplifier to the requirements of the SPS N82-12554
SPS antenna element evaluation N82-12555
The Resonant Cavity Radiator (RCR) N82-12556
Evaluation of thick wall wave guide element N82-12557
Method for precision forming of low-cost, thin-walled slotted waveguide arrays for the SPS N82-12558
Considerations for high accuracy radiation efficiency measurements for the Solar Power Satellite (SPS) subarrays N82-12559
The history of the development of the rectenna N82-12560
Rectenna system design N82-12561
Rectenna session: Micro aspects N82-12562
A theoretical study of microwave beam absorption by a rectenna N82-12563
Rectenna array measurement results N82-12564
Session on solid state: Introduction N82-12565
Modified reference SPS with solid state transmitting antenna N82-12566
SPS solid state antenna power combiner N82-12567
Solid-state retrodirective phased array concepts for microwave power transmission from Solar Power Satellite N82-12568

MICROWAVES
Simple-power-balance model for microwave heating in EBT
[DE81-030426] N82-12953

MIGRATION
Lateral migration of neutrally buoyant rigid spheres in small ducts — capillary blood flow
[MPIS-20/1980] N82-12406

MILITARY AIR FACILITIES
Terminal forecast reference notebook, detachment 12, 15th weather squadron for Selfridge Air National Guard Base, Michigan
[AD-A105083] N82-12727
Terminal forecast reference notebook for Scott Air Force Base, Illinois
[AD-A105084] N82-12728

MILITARY TECHNOLOGY
Military geodesy and geospace science unit four
[AD-A105073] N82-12702

MINERAL DEPOSITS
Data base for the analysis of compositional characteristics of coal seams and macerals
[DE81-031977] N82-12522
Interactive computer methods for generating mineral-resource maps
[CIRC-815] N82-12527

MINERAL EXPLORATION
Hydrogeochemical and stream sediment reconnaissance basic data for Ruby Quadrangle, Alaska
[DE81-029982] N82-12512
Hydrogeochemical and stream sediment reconnaissance basic data for Wainwright Quadrangle, Alaska
[DE81-028670] N82-12528
Hydrogeochemical and stream sediment reconnaissance basic data for Point Lay Quadrangle, Alaska
[DE81-028669] N82-12529

MINERAL METABOLISM
Biogeochemical evidence for subsurface hydrocarbon occurrence, recluse oil field, Wyoming: Preliminary results
[USGS-CIRC-837] N82-12693

MINES
Evaluation of novel underground transport systems
[DE81-030279] N82-12520

MINES (EXCAVATIONS)
A land use decision methodology for mine lands in Appalachia
[PB81-220113] N82-12678

MINIATURE ELECTRONIC EQUIPMENT
Development of a small opto-electronic distance measuring device
[BMFT-FB-T-80-168] N82-12938

MINICOMPUTERS
Solution of nonlinear structural problems using array processors
[AD-A104987] N82-12800

MINING
USSR report: Earth sciences, no. 17
[JPRS-79342] N82-12489
Extensible bridge-conveyor concept development
[DE81-031973] N82-12519
Feasibility analysis of trench strip and auger mining
[DE81-027557] N82-12521
Extensible bridge-conveyor concepts for coal-mine face haulage
[DE81-031974] N82-12525

MINNESOTA
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] N82-12604

MIRROR FUSION
Disruption of high beta plasma induced by resistive drift mode
[IPPJ-538] N82-12939

MIRRORS
Passive Optical Sample Assembly (POSA)
[NASA-TM-82446] N82-12656
Study of hollow corner retroreflectors for use in a synchronous orbit
[NASA-CR-166750] N82-12931
Infrared reflectance and refractive index measurements in vacuum-rated hemiellipsoidal mirror reflectometer from 20 to 300 deg K — gas condensates on mirror surfaces
[AD-A105113] N82-12933
Production interferometric testing of diamond-turned surfaces
[DE82-000172] N82-12937
The removal, mechanical handling and installation procedures for re-aluminising the UKIRT 3.8m primary mirror — United Kingdom Infrared Telescope (UKIRT)
[UKIRT-11] N82-13025

MISSILE LAUNCHERS
HAWK launcher shock absorber (Part number 11567877)
[AD-A105384] N82-12102

MISSILE TRAJECTORIES
Yawsonde tests of 2.75-inch Mk66 mod 1rocket
[AD-A104904] N82-12101

MISSOURI
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] N82-12604

MIXING
On the manipulation of spreading rates of forced mixing layers
[AD-A105236] N82-12390

MIXING LENGTH FLOW THEORY
Self-sustained oscillations of a mixing layer. Edge system N82-12374

MIXTURES
The stabilization of coal-oil mixtures N82-12237

MODULAR RATIOS
Qualification vibration test report for SD 802 materials experiment
[AD-A105321] N82-12132

MOISTURE CONTENT
Progress in radar snow research --- Brookings, South Dakota
[NASA-CR-166709] N82-12510

MOLECULAR BEAM EPITAXY
Selected area growth for digital integrated circuits and atomic plane doping of gallium arsenide by molecular beam epitaxy N82-12956

MOLECULAR CHAINS
Studies of free radicals by ultraviolet excimer laser photolysis
[DE82-000688] N82-12184

MOLECULAR COLLISIONS
Electronic excitation in molecular collisions: Structural, dynamic and kinetic considerations
[AD-A105054] N82-12174
Time-of-flight spectroscopy of molecular structure, collision processes and gas-surface interactions
[AD-A105438] N82-12896
Experimental demonstration of Feshbach resonances in atom-molecule scattering, with the help of measurements on the H2(pH2)-Kr and HD-Xe systems
[MPIS-14/1980] N82-12913

MOLECULAR ENERGY LEVELS
Studies of free radicals by ultraviolet excimer laser photolysis
[DE82-000688] N82-12184

MOLECULAR EXCITATION
Electronic excitation in molecular collisions: Structural, dynamic and kinetic considerations
[AD-A105054] N82-12174
Studies of free radicals by ultraviolet excimer laser photolysis
[DE82-000688] N82-12184
Dynamics of an intense relativistic electron beam injected into full density air
[AD-A104743] N82-12901

MOLECULAR FLOW
Monte Carlo simulation of molecular flow in a neutral-beam injector and comparison with experiment
[DE82-000503] N82-12909

MOLECULAR GASES
Electron field emission tunneling spectroscopy of platinum group and tungsten metals in the presence of molecular gas and noble metal adsorbates
N82-12957

MOLECULAR INTERACTIONS
Electronic excitation in molecular collisions: Structural, dynamic and kinetic considerations
[AD-A105054] N82-12174
Application of ion cyclotron resonance spectroscopy, photoionization mass spectrometry and photoelectron spectroscopy to study the properties and reactions of ions in gases
[DE81-030296] N82-12189
Modeling of thin-film GaAs growth
[NASA-CR-164992] N82-12965

MOLECULAR RELAXATION
Molecular orientation in polymers: A study of hot-drawn polymethylmethacrylate N82-12228

MOLECULAR SPECTRA
Orientation measurements from polymer surfaces using Fourier transform infrared photoacoustic spectroscopy
[AD-A105398] N82-12232

MOLECULAR STRUCTURE
Structure of laminar premixed flames of methane, methanol and their blends in oxygen N82-12164
Electronic excitation in molecular collisions: Structural, dynamic and kinetic considerations
[AD-A105054] N82-12174
Acetylene terminated phenylene thermoset systems
[AD-A105394] N82-12176

MOLECULES
Multiple electromagnetic scattering from a cluster of spheres. Volume 1: Theory
[AD-A105453] N82-12310

MOLTEN SALT ELECTROLYTES
Behavior of alkali metal-acid phosphates during elevated temperature water electrolysis
[DE82-000243] N82-12181
Galvanic high energy cells with molten salt electrolytes --- electric vehicle propulsion
[BMFT-FB-T-81-048] N82-12643

MOLYBDENUM
Synthesis gas conversion to liquid fuels using promoted fused iron catalysts
[DE81-030657] N82-12259

MONITORS
Electronic Master Monitor and Advisory Display System (EMMADS)
[AD-A105062] N82-12067
User's guide to the hydrogen monitor --- high temperaure gas cooled reactors
[DE81-032023] N82-12425
Integrated humidity sensor --- relative humidity of air
[BMFT-FB-T-81-007] N82-12426
Biomedical technology transfer. Applications of NASA science and technology
[NASA-CR-164991] N82-13012

MONOMOLECULAR FILMS
Study of Al/Si interface by photoemission, Auger electron spectroscopies
[DESY-SR-80/08] N82-12979

MONTANA
Feasibility and economic study of medium-Btu coal gas blended with high-Btu by-product gas as an industrial energy source at Billings, Montana
[DE81-030622] N82-12254

MONTE CARLO METHOD
A Monte Carlo study of the use of auxiliary information in the developent of an impact acceleration injury prediction model
[AD-A105483] N82-12755
Description and use of the Monte Carlo code LILITA
[DE81-030704] N82-12904
Diffusion of gases in capillaries
[DE82-000267] N82-12906
Monte Carlo simulation of molecular flow in a neutral-beam injector and comparison with experiment
[DE82-000503] N82-12909

MORPHOLOGY
Behavior and morphology of palladium on alumina model catalysts in hydrogen and oxygen
N82-12163

MOSSBAUER EFFECT
Investigations and applications of polarimetric and high resolution Moessbauer spectroscopy
N82-12170

MOTION PERCEPTION
Close-range cine-photogrammetry: A generalized technique for quantifying gross human motion
N82-12781

MOUNTAINS
Snow-mapping experiment N82-12498

MOVING TARGET INDICATORS
Moving target Detector/Airport Surveillance radar (ASR-7) field evaluation
[AD-A105198] N82-12303
Evaluation of the performance of a simplified MTI canceller selection rule for FUCAS --- radar target selection
[PHL-1981-24] N82-12330

MULTICHANNEL COMMUNICATION
Performance evaluation of the virtual subchannel concept for satellite link communication
[ENST-D-81002] N82-12324

MULTIPHOTON ABSORPTION
Application of ion cyclotron resonance spectroscopy, photoionization mass spectrometry and photoelectron spectroscopy to study the properties and reactions of ions in gases
[DE81-030296] N82-12189

MULTIPLE ACCESS
Unifications and extensions of the multiple access communications problem N82-12289
Analysis of noncoherent multiple access communication channels N82-12292
Message queueing delays in polling schemes with applications to data communication networks
N82-12294
The queueing delay problem in multiple access schemes N82-12836

MULTIPLEXING
Extracted-pole filter multiplexion and asymetric double array network synthesis
[ESA-CR(P)-1453] N82-12371

MULTIPOLAR FIELDS
Multiple electromagnetic scattering from a cluster of spheres. Volume 1: Theory
[AD-A105453] N82-12310
High-mode-number MHD stability of a toroidal multipole
[DE81-030484] N82-12950

MULTIPROCESSING (COMPUTERS)
Solution of nonlinear structural problems using array processors
[AD-A104987] N82-12800
Data flow and bus structure in a loosely coupled multiprocessor computer system ARCADE
[ENST-C-81003] N82-12805
System software for the ESTEC multiprocessor reconfigurable simulator
[ESA-CR(P)-1456] N82-12830
A model for uncoordinated distributed computation of fixed points
[AD-A104819] N82-12850

MULTIPROGRAMMING
System software for the ESTEC multiprocessor reconfigurable simulator
[ESA-CR(P)-1456] N82-12830

MULTISPECTRAL LINEAR ARRAYS
Data rate reduction, phase 2 --- breadboard processor for multispectral imagery
[TNOT/0001/SAAB-ISSUE-3] N82-12829

MUSCULOSKELETAL SYSTEM
Quantitation of tissue loss during prolonged space flight
[NASA-CR-167460] N82-12752

N

N-TYPE SEMICONDUCTORS
Analysis of the temperature dependence of resistivity in N-type silicon
[AD-A105192] N82-12976

NATURAL GAS
Fuel savings in hot water heating plants by application of heat pumps operated with natural gas (natural gas heat pump). Project: gas engine
[BMFT-FB-T-80-125] N82-12641

NATURAL LANGUAGE (COMPUTERS)
SISU: A programming language for computational linguistics, with an application to the analysis of Finnish N82-12809
Semantics of inheritance and attributions in the description system Omega
[AD-A104776] N82-12841

NAVIER-STOKES EQUATION
Computation of general two-dimensional steady viscous flows
[AD-A105232] N82-12389
A solution of the Navier-Stokes equations by a mixed finite element method
[ESA-TT-720] N82-12416
The three dimensional spherical model for the AGCE N82-12721
Model verification studies using accurate measurements of spin up N82-12722

NAVIGATION AIDS
Flight evaluation of LORAN-C as a helicopter navigation aid in the Baltimore Canyon oil exploration area
[AD-A105260] N82-12059

NEGATIVE IONS
Design analysis of supplemental heating systems
[DE81-030678] N82-12397
Design analysis of supplemental heating systems
[DE82-030677] N82-12398

NEODYMIUM LASERS
Laser systems for the Combustion Research Facility: Orion
[DE81-030889] N82-12437
NERVOUS SYSTEM
Transcutaneous electrical peripheral nerve stimulation: implications for neural control mechanisms N82-12749
NETHERLANDS
Orienting description of air traffic control in the Netherlands
[VTH-LR-285] N82-12063
NETWORK ANALYSIS
Modeling and performance optimization of large-scale data-communication networks
N82-12290
The analysis and synthesis of interconnection networks for distributed computer systems
N82-12834
NETWORK CONTROL
Fault testing and diagnosis implementation in microprocessor controlled data networks
[ESNT-D-81001] N82-12836
Assignment techniques for heavily loaded networks
[A-79-VK-45-07] N82-12988
NETWORK SYNTHESIS
Computer-aided synthesis and design of Monolithic Microwave Integrated Circuits (MMICS) N82-12335
Extracted-pole filter multiplexion and asymetric double array network synthesis
[ESA-CR(P)-1453] N82-12371
Velocity-space synthesis of ISEE-1 measurements of the three dimensional electron distribution function
[NASA-TM-83838] N82-12813
NEUROTRANSMITTERS
Neurotransmitter mechanisms in the nucleus accumbens septi and related regions in the rat brain
[NDRE/PUBL-81/1001] N82-12738
NEUTRAL ATOMS
Bremsstrahlung energy spectra from electrons of kinetic energy 1 keV less than or equal to T less than or equal to 2000 keV incident on neutral atoms 1 less than or equal to Z less than or equal to 92
[DE81-030984] N82-12902
NEUTRAL BEAMS
Monte Carlo simulation of molecular flow in a neutral-beam injector and comparison with experiment
[DE82-000503] N82-12909
Electrode design and performance of the ORNL positive ion sources
[DE81-030426] N82-12910
NEUTRAL PARTICLES
Design analysis of supplemental heating systems
[DE81-030678] N82-12397
Design analysis of supplemental heating systems
[DE82-030677] N82-12398
NEUTRALIZERS
Environmental control technology for coal cleaning wastes
[DE81-025331] N82-12676
NEUTRON CROSS SECTIONS
PAPIN: A FORTRAN-4 program to calculate cross section probability tables, Bondarenko and transmission self-shielding factors for fertile isotopes in the unresolved resonance region
[DE81-030436] N82-12903
Neutron cross section measurements using the ORELA: The stable tellurium isotopes (n, beta), U(n,n')-238, Th(n,n')-232, Os(n,n')-187, Os(n,nn' beta)-186,187,188, and Tl(n,n beta)-205
[DE81-030164] N82-12907
NEUTRON SOURCES
Upgrading the intense neutron source high voltage power supply
[DE81-028970] N82-12364
NEUTRON STARS
Instanton effects in the equation of state for dense neutron star matter
[HU-TFT-79-19] N82-13023
Matter accreting neutron stars
[NASA-TM-83835] N82-13031
NEVADA
Geothermal reservoir assessment: Northern basin and range province Stillwater prospect, Churchill County, Nevada
[DE82-000529] N82-12516
NEW JERSEY
Flight evaluation of LORAN-C as a helicopter navigation aid in the Baltimore Canyon oil exploration area
[AD-A105260] N82-12059
NEWTONIAN FLUIDS
Computation of general two-dimensional steady viscous flows
[AD-A105232] N82-12389
NICKEL
Solvent extraction studies using high-molecular-weight amines
[DE81-030061] N82-12191
NICKEL ALLOYS
Survey of nickel-aluminium-bronze casting alloys on marine applications
[AD-A105263] N82-12218
Viscoplastic and creep crack growth analysis by the finite element method
[AD-A105120] N82-12476
NICKEL CADMIUM BATTERIES
Electrochemical models for the discharge characteristics of the nickel cadmium cell
[NASA-TM-83814] N82-12569
Voltage losses and reconditioning of NiCd cells: Behavior during cycling
[AD-A105418] N82-12575
Impedance and mass transport kinetics of nickel cadmium cells
[AD-A105320] N82-12576
NICKEL OXIDES
Coprecipitated nickel-alumina methanation catalysts N82-12169
NIGHT
Adverse weather and night capability: A call for action. Volume 2: Appendix, data base for selected important military locations
[AD-A104991] N82-12726
NIOBIUM
Characterization of as-grown dislocation structure in niobium by X-ray diffraction topography
[AD-A105431] N82-12969
NIOBIUM ALLOYS
Thermotransport of hydrogen and deuterium in vanadium, niobium and tantalum alloys N82-12208
Superconductivity in Th-Nb composites
[DE81-030746] N82-12363
NITRATES
Removal of nitrates from ground waters by reverse osmosis
[BMFT-FB-T-80-155] N82-12203
NITRIDES
Synthesis gas conversion to liquid fuels using promoted fused iron catalysts
[DE81-030857] N82-12259
NITROGEN DIOXIDE
Midway house-tightening project: A study of indoor air quality — concentrations of radon formaldehyde, and nitrogen dioxide
[DE81-030866] N82-12277
NITROGEN OXIDES
Fuel nitrogen conversion during fuel rich combustion of pulverized coal and char N82-12156
Low NO sub x heavy fuel combustor concept program
[NASA-CR-165512] N82-12572
NOBLE METALS
Electron field emission tunneling spectroscopy of platinum group and tungsten metals in the presence of molecular gas and noble metal adsorbates
N82-12957
NOISE INJURIES
Damage risk criteria for impulse noise — industrial deafness
[IZF-1980-26] N82-12771
NOISE METERS
An investigation of the status of bone conduction audiometer calibration in the National Health Service
[NPL-AC-101] N82-12769
NOISE POLLUTION
Effects of activity interference on annoyance due to aircraft noise
[NASA-TP-1938] N82-12654
NOISE REDUCTION
Feasibility study of device synthesis of non-linear filters
[AD-A105417] N82-12354
Analysis of integrated fuel-efficient, low-noise procedures in terminal-area operations
[DE81-029833] N82-13014
NOISE TEMPERATURE
Study of 1/f noise in solids
[AD-A105219] N82-12966
NOISE THRESHOLD
Damage risk criteria for impulse noise — industrial deafness
[IZF-1980-26] N82-12771
NONDESTRUCTIVE TESTS
In-service inspection methods for graphite-epoxy structures on commercial transport aircraft
[NASA-CR-165746] N82-12142
Bibliographical study of nondestructive testing applicable to bonding
[CETIM-1.3N.20.2-PT-1] N82-12481
NONEQUILIBRIUM FLOW
Calculation of transient and quasi-stationary flows in high temperature reactors with spherical nuclear fuel elements, using the vortex flow method
[IKE-4-98] N82-12928
NONLINEAR EQUATIONS
Instructive experiments with Runge-Kutta-Rosenbruck methods
[MC-NW-100/81] N82-12856
Application of the Osher-Engquist difference scheme and the full multigrid method to a two dimensional nonlinear elliptic model equation
[MC-NW-103/81] N82-12858
Analysis of Richardson iteration in multigrid methods for nonlinear parabolic differential equations
[MC-NW-105/81] N82-12859
NONLINEAR FILTERS
Feasibility study of device synthesis of non-linear filters
[AD-A105417] N82-12354
NONLINEAR PROGRAMMING
Practical aspects of nonlinear optimization
[AD-A104858] N82-12823
NONLINEAR SYSTEMS
A non-linear model for low velocity underwater explosions N82-12235
Studies of optical-beam phase-conjugation by nonlinear refraction
[AD-A105066] N82-12435
Nonlinear real-time optical signal processing
[AD-A105186] N82-12798
Solution of nonlinear structural problems using array processors
[AD-A104967] N82-12800
Nonlinear interaction of sound waves in water: Experiments with parametric arrays
[PHL-1f/79-44] N82-12897
NONLINEARITY
A second-order accurate procedure for solving the boundary layer equations based on the predictor-corrector form of the Crank-Nicolson scheme
[NAL-TR-655T] N82-12384
NORMAL DENSITY FUNCTIONS
Natural exponential families with quadratic variance functions
[P-6637] N82-12844
Bivariate cumulants of a singly truncated bivariate normal distribution
[AD-A104914] N82-12847
Development and analysis of a modified screening procedure to increase acceptable product
[AD-A104936] N82-12874
NORMS
Norm conditions for the path regularity of random processes
[CTH-MATH-1981-12] N82-12881
NORTH AMERICA
Geological features of southwestern North America N82-12495
NORTH CAROLINA
Peat deposits of Dismal Swamp pocosins: Camden, Currituck, Gates, Pasquotank, and Perquimans Counties, North Carolina
[DE81-029842] N82-12524
NORTH DAKOTA
Status of the Great Plains coal gasification plant
[EMD-81-64] N82-12242
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] N82-12604
NOSE CONES
Study and development of face-contact, bellows mechanical seal for liquid hydrogen turbopump
[NAL-TR-663] N82-12443

NOSE TIPS
An experimental study of massive blowing from a nosetip during Jovian entry
[NASA-CR-165756] N82-12386
NOTCH STRENGTH
Working strength of notched specimens in steel Ck45 and steel 42 Cr Mo4
[LBF-FB-156(1980)] N82-12483
NOTCH TESTS
Working strength of notched specimens in steel Ck45 and steel 42 Cr Mo4
[LBF-FB-155(1980)] N82-12483
NOZZLE DESIGN
Method and system for nuclear waste disposal — control valves for encapsulating wastes
[NASA-CASE-NPO-15464-1] N82-12916
NUCLEAR FUEL ELEMENTS
Calculation of transient and quasi-stationary flows in high temperature reactors with spherical nuclear fuel elements, using the vortex flow method
[IKE-4-96] N82-12928
NUCLEAR FUEL REPROCESSING
Is spent fuel or waste from reprocessed spent fuel simpler to dispose of?
[EMD-81-76] N82-12917
NUCLEAR FUELS
Application of different KFA-models in the framework of the energy research programme of the European Communities
[EUR-6756-EN] N82-12597
Space nuclear safety and fuels program
N82-12921
NUCLEAR INTERACTIONS
Very-high-energy nuclear physics
[DE81-030025] N82-12920
NUCLEAR MAGNETIC RESONANCE
Nuclear magnetic resonance studies of solid krypton N82-12961
NUCLEAR MODELS
Application and description of the interacting Boson Model N82-12914
NUCLEAR POTENTIAL
Determination of a potential model for the calculation of interatomic potentials in the case of alkali-rare gas interaction
[MPIS-16/1980] N82-12912
NUCLEAR POWER PLANTS
Low-level radioactive waste: An introductory overview
[DE81-026334] N82-12924
NUCLEAR POWER REACTORS
Low-level radioactive waste: An introductory overview
[DE81-02[illegible]4] N82-12924
NUCLEAR RADIATION SPECTROSCOPY
Investigations and applications of polarimetric and high resolution Moessbauer spectroscopy
N82-12170
NUCLEAR SCATTERING
Nuclear structure study at intermediate energies
[DE81-030156] N82-12911
Very-high-energy nuclear physics
[DE81-030025] N82-12920
NUCLEAR STRUCTURE
Nuclear structure studies by the scattering of medium-energy electrons
[DE81-030058] N82-12905
Nuclear structure study at intermediate energies
[DE81-030156] N82-12911
NUCLEATE BOILING
Propagation of a liquid-liquid explosion
[DE81-030780] N82-12252
NUCLEI (NUCLEAR PHYSICS)
Application and description of the interacting Boson Model N82-12914
NUMERICAL ANALYSIS
Transonic airfoil design of full potential flow. 1: Numerical procedure and its computational examples
[HAL-TR-672] N82-12038
A study of time evolution of continuous vortex loops in a homogeneous or stratified fluid N82-12381
The calculation of heat exchanger performance
[HTS/81/5] N82-12412
Geochemical modeling: A review
[DE81-029969] N82-12708
The three dimensional spherical model for the AGCE N82-12721
Preliminary regime diagram on a sphere with a simplified general circulation model N82-12723
The numerical solution of Fredholm integral equations of the first kind N82-12843
NUMERICAL CONTROL
Application of Kalman filtering in computer relaying of power systems N82-12336
Design study of a continuously variable roller cone traction CVT for electric vehicles
[NASA-CR-159841] N82-12445
Vertical-axis wind-turbine control strategy
[DE81-031932] N82-12591
Evaluation of microprocessors for process control applications N82-12807
Technology of tomorrow: Computer assisted design and fabrication
[CETIM-1.4A.32.3] N82-12828
NUMERICAL FLOW VISUALIZATION
The numerical solution of incompressible turbulent flow over airfoils N82-12030
NUMERICAL STABILITY
Instructive experiments with Runge-Kutta-Rosenbruck methods
[MC-NW-100/81] N82-12856
On the practical value of the notion of BN-stability
[MC-NW-101/81] N82-12857
A special class of multistep Runge-Kutta methods with extended real stability interval
[MC-NW-106/81] N82-12860
NUTATION DAMPERS
Energy dissipation in Exosat tanks: Test results
[CNES-NT-99] N82-12103

O

O RING SEALS
W76 elastomers/propellant compatibility
[DE81-031933] N82-12256
Compression stress relaxation testing for determining the performance of elastomeric fluid shells N82-12459
OCEAN BOTTOM
Global isostatic geoid anomalies for plate and boundary layer models of the lithosphere
[NASA-CR-164985] N82-12695
Long ocean waves on linearly varying bottom topographies N82-12733
Maritime support for ocean-resources development
[AD-A104730] N82-12735
OCEAN CURRENTS
Long ocean waves on linearly varying bottom topographies N82-12733
OCEAN DATA ACQUISITIONS SYSTEMS
Hydrophysical instrumentation and computer complex N82-12490
Boundary detection criteria for satellite altimeters
[NASA-CR-156860] N82-12734
Oceanographic technology information service: User's guide
[AD-A104670] N82-12736
OCEAN SURFACE
Visual observations of the ocean N82-12502
Evaluation of a method for short-range forecasting of evaporation duct heights
[AD-A104892] N82-12724
Long ocean waves on linearly varying bottom topographies N82-12733
OCEANOGRAPHY
USSR report: Earth sciences, no. 17
[JPRS-79342] N82-12489
An assessment of the potential contributions to oceanography from Skylab visual observations and handheld-camera photographs N82-12503
OFFSHORE ENERGY SOURCES
Flight evaluation of LORAN-C as a helicopter navigation aid in the Baltimore Canyon oil exploration area
[AD-A105260] N82-12059
OGIVES
Research developing closed loop roll control for magnetic balance systems
[NASA-CR-164989] N82-12084
OHIO
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] N82-12804
OIL EXPLORATION
Biogeochemical evidence for subsurface hydrocarbon occurrence, recluse oil field, Wyoming: Preliminary results
[USGS-CIRC-837] N82-12693
OIL POLLUTION
Combustion: An oil spill mitigation tool. Phase 2: The burning of the M/T BURMAH AGATE (ex-DANALAND)
[DE82-000527] N82-12663
A statistical evaluation of OHMSETT testing
[PB81-226128] N82-12679
OIL SLICKS
Combustion: An oil spill mitigation tool. Phase 2: The burning of the M/T BURMAH AGATE (ex-DANALAND)
[DE82-000527] N82-12663
OILS
The stabilization of coal-oil mixtures N82-12237
ON-LINE SYSTEMS
Communicating graphics — via public data networks
[MC-IW-166/81] N82-12837
ONBOARD DATA PROCESSING
Hydrophysical instrumentation and computer complex N82-12490
ONBOARD EQUIPMENT
Design study report for General Aviation Loran-C receiver
[AD-A104921] N82-12062
ONTARIO
An evaluation of the performance of 12 GHz low cost TVRO terminals in northwestern Ontario — ground terminals for ANIK B
[CRC-1345] N82-12299
OPERATING SYSTEMS (COMPUTERS)
UNIX NSW front and enhancements, volume 1
[AD-A105035] N82-12801
An operational approach to requirements specification for embedded systems
[AD-A105459] N82-12821
Redundancy versus query time trade-offs for data structures N82-13004
OPERATIONS RESEARCH
The GLAS editing procedures for the FGGE level II-B data collected during SOP-1 and 2
[NASA-TM-83811] N82-12794
OPERATOR PERFORMANCE
Target assessment performance with 5 inch and 9 inch television monitors
[DE81-026754] N82-12317
Cybernetics and car driving: A driver model and its experimental validation
[IZF-1980-13] N82-12776
Cybernetics and car driving: Perspective perception and the output vector of the system to be controlled
[IZF-1980-19] N82-12778
Equipment design must incorporate ease of operation N82-12790
OPTICAL COMMUNICATION
An advanced 500-MHZ-bandwidth fiber-optic signal link for EMP and general laboratory applications
[AD-A105118] N82-12314
OPTICAL COUPLING
Integration of a detector array with an optical waveguide structure and applications to signal processing
[AD-A105067] N82-12932
OPTICAL DATA PROCESSING
Real-time multiple-look synthetic aperture radar processor for spacecraft applications
[NASA-CASE-NPO-14054-1] N82-12297
Nonlinear real-time optical signal processing
[AD-A105186] N82-12798
OPTICAL HETERODYNING
Excess noise in tunable diode lasers
[NASA-TP-1935] N82-12431
OPTICAL MEASURING INSTRUMENTS
Calibration of a turbidity meter for making estimates of total suspended solids concentrations and beam attenuation coefficients in field experiments
[NASA-TM-81673] N82-12655
OPTICAL PATHS
Aerodynamic measurements concerned with a turret model
[NASA-CR-166264] N82-12034

OPTICAL PROPERTIES
Alignment of the Cassegrain and Coude optics of the 3.8m UK infrared telescope; assessment of the optical performance and results of aberration calculations
[UKIRT-10] N82-13024
OPTICAL RADAR
Detection of laser radiation by means of forward scattering in the atmosphere
[PHL-1979-61] N82-12327
Remote determination of atmospheric gases with a DF laser
[GKSS-80-E-40] N82-12711
OPTICAL RANGE FINDERS
Development of a small opto-electronic distance measuring device
[BMFT-FB-T-80-166] N82-12936
OPTICAL RESONATORS
Studies of optical-beam phase-conjugation by nonlinear refraction
[AD-A106086] N82-12435
OPTICAL WAVEGUIDES
An advanced 500-MHZ-bandwidth fiber-optic signal link for EMP and general laboratory applications
[AD-A105116] N82-12314
Low-loss fiber waveguides
[AD-A104943] N82-12358
Studies of optical-beam phase-conjugation by nonlinear refraction
[AD-A106086] N82-12435
Integration of a detector array with an optical waveguide structure and applications to signal processing
[AD-A105087] N82-12932
OPTIMAL CONTROL
Application of singular perturbation theory N82-12050
Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164963] N82-12060
Performance analysis and simulation of the SPS reference phase control system N82-12544
Optimal synchronization for a distributed database N82-12791
Dynamic programming for problems of impulse control N82-12806
A survey of some problems and recent results for parameter estimation and optimal control in delay and distributed parameter systems
[NASA-CR-16491] N82-12839
Project impact analysis as an optimal control problem --- irrigation and hydroelectric power project
[DE81-026466] N82-12842
OPTIMIZATION
Unifications and extensions of the multiple access communications problem N82-12289
Modeling and performance optimization of large-scale data-communication networks N82-12290
Practical aspects of nonlinear optimization
[AD-A104888] N82-12823
A regression design approach to optimal and robust spacing selection
[AD-A104728] N82-12846
On the computation of optimal designs for certain time series models with applications to optimal quantile selection for location or scale parameter estimation
[AD-A104835] N82-12875
Large-scale systems optimization using nonlinear integer goal programming methods N82-12882
Satisfactory solutions approach to control and optimization of large-scale systems N82-12883
OPTOGALVANIC SPECTROSCOPY
Optogalvanic spectroscopy and cataphoretic laser isotope separation N82-12929
ORBIT CALCULATION
Orbit improvement of the satellites of the outer planets
[NASA-CR-164987] N82-13037
ORBIT PERTURBATION
Topics in the evolution of cosmological perturbations N82-13029
ORBITAL ASSEMBLY
Study to define an approach for developing a computer-based system capable of automatic, unattended assembly/disassembly of spacecraft, phase 1
[NASA-CR-165740] N82-12092
Space Construction Experiment Definition Study (SCEDS), part 1. Volume 1: Executive summary
[NASA-CR-167488] N82-12094
ORBITAL MECHANICS
Contributions of orbital mechanics to conducting experiments in space N82-12124
ORBITAL SERVICING
Satellite maintenance in orbit N82-12098
ORGAN WEIGHT
Quantitation of tissue loss during prolonged space flight
[NASA-CR-167460] N82-12752
ORGANIC CHEMISTRY
Analysis for organic pigments using solution spectrophotometry N82-12150
ORGANIC COMPOUNDS
Electrophotolysis oxidation system for measurement of organic concentration in water
[NASA-CASE-MSC-16497-1] N82-12166
Dehydrogenation/hydrogenation reactions in hydroaromatic systems
[DE81-027687] N82-12201
Measurement procedure to determine organic compounds in water (combustion method)
[BMFT-FB-T-81-014] N82-12206
Prediction of crystal densities of organic explosives by group additivity
[DE81-032016] N82-12249
ORGANIC WASTES (FUEL CONVERSION)
Energy recovery from municipal solid waste and sewage sludge using multi-solid fluidized bed combustion technology
[DE82-001142] N82-12596
Interactive model to assess economics of anaerobic digestion of the farm
[DE82-000452] N82-12620
Waste-to-energy Systems Institutional Barriers Assessment Workshop
[DE82-000096] N82-12621
Costs for alternative grain-residue-collection systems
[DE81-029072] N82-12633
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic fuels production
[DE81-030622] N82-12661
ORGANIZATIONS
Worldwide directory of national Earth-science agencies and related international organizations
[USGS-CIRC-834] N82-12487
ORGANOMETALLIC COMPOUNDS
Reactions of tributylstannyl anioniods with alkyl bromides
[AD-A105433] N82-12136
Palladium-catalyzed coupling reactions: Mechanism of reductive elimination
[DE81-030169] N82-12188
Application of ion cyclotron resonance spectroscopy, photoionization mass spectrometry and photoelectron spectroscopy to study the properties and reactions of ions in gases
[DE81-030296] N82-12189
OSCILLATING FLOW
The response and the lift force analysis of a cylinder oscillating in still water N82-12464
OSCILLATORS
The effect of optically enhanced leakage current on S-band TRAPATT diode oscillators N82-12342
OSO-8
Data reduction and analysis for the graphite crystal X-ray spectrometer and polarimeter experiment flown aboard OSO-8 spacecraft
[NASA-CR-166749] N82-13030
OTTO CYCLE
Electric and hybrid vehicle environmental control subsystem study
[NASA-CR-164996] N82-12658
OUTGASSING
Thermal desorption spectra, equilibrium desorption rates and equilibrium surface coverages of mechanically polished and of sand and bead blasted Inconel 600 surfaces
[EUR-7114-EN] N82-12224
W76 elastomers/propellant compatibility
[DE81-03193.] N82-12258
OUTLIERS (STATISTICS)
Detecting outliers in energy time-series data
[DE81-030230] N82-12586
OXIDATION
Thermal oxidative degradation reactions of perfluoroalkylethers
[NASA-CR-165516] N82-12135
Oxydesulfurization of coal by acidic iron sulfate solutions
[DE82-000464] N82-12199
Kinetics of wet oxidation of biological sludges from coal-conversion wastewater treatment
[DE82-000525] N82-12674
Wet air oxidation of waste water
[BMFT-FB-T-80-132] N82-13016
OXIDIZERS
A search for new fuel components in explosive mixtures with ammonium nitrate
[AD-A104861] N82-12245
OXYGEN
Oxygen toxicity and lung collagenous protein
[AD-A104702] N82-12756
Oxygen induced triplet state transitions of benzene in cryogenic solutions
[AD-A105432] N82-12900
OZONOMETRY
Special observations by the Hohenpeissenberg Meteorological Observatory. Number 42: Results of aerological and surface ozone measurements during the first semester of 1980
[SONDERBEOB-42] N82-12714

P

PACIFIC NORTHWEST (US)
Chemical and geochemical studies off the coast of Washington
[DE81-030319] N82-12513
PACIFIC OCEAN
An assessment of the potential contributions to oceanography from Skylab visual observations and handheld-camera photographs N82-12503
PACKET TRANSMISSION
Combined report number 22. SATNET development and operation, Pluribus Satellite IMP development, remote site maintenance, internet development, mobile access terminal network, TCP for the HP3000, TCP-TAC, TCP for VAX-UNIX
[AD-A104931] N82-12313
PAIN
Transcutaneous electrical peripheral nerve stimulation: implications for neural control mechanisms N82-12749
PAINTS
Paint selection for coating radioactive-waste drums
[DE81-026259] N82-12234
PALLADIUM
Behavior and morphology of palladium on alumina model catalysts in hydrogen and oxygen N82-12163
Palladium-catalyzed coupling reactions: Mechanism of reductive elimination
[DE81-030169] N82-12188
PARABOLIC DIFFERENTIAL EQUATIONS
Analysis of Richardson iteration in multigrid methods for nonlinear parabolic differential equations
[MC-NW-105/81] N82-12859
PARABOLIC REFLECTORS
Near-term improvements in parabolic troughs: An economic and performance assessment
[DE82-001156] N82-12615
PARABOLOID MIRRORS
Multiple-beam, high-power, precision pointing antenna system
[NASA-CASE-NPO-15406-1] N82-12345
PARAFFINS
Latent heat storage devices. Part 1: Characteristics and applicability of latent heat storage devices
[BMVG-FBWT-79-12-PT-1] N82-12638
PARALLEL FLOW
Calculation of annular and twin parallel jets using various discretization schemes and turbulence model variants
[KU-SFB-80/T/159] N82-12363
PARALLEL PROCESSING (COMPUTERS)
Thinking about lots of things at once without getting confused: Parallelism in Act 1
[AD-A104965] N82-12799
Schemes for communication --- interprocessor communication
[AD-A104791] N82-12819

Parallel string parsing using lattice graphs
[AD-A105028] N82-12820

PARAMAGNETIC RESONANCE
Construction and characteristics of an optically pumped FIR-LMR spectrometer — far infrared (FIR) laser magnetic resonance (LMR) spectrometer
[MPIS-16/1980] N82-12438

PARAMETER IDENTIFICATION
Numerical computation of two phase flow in gun barrels
[HTS/81/6] N82-12413
A survey of some problems and recent results for parameter estimation and optimal control in delay and distributed parameter systems
[NASA-CR-16491] N82-12839
A regression design approach to optimal and robust spacing selection
[AD-A104728] N82-12846
On the computation of optimal designs for certain time series models with applications to optimal quantile selection for location or scale parameter estimation
[AD-A104935] N82-12875

PARAMETRIC AMPLIFIERS
Nonlinear interaction of sound waves in water: Experiments with parametric arrays
[PHL-1979-44] N82-12897

PARSING ALGORITHMS
Parallel string parsing using lattice graphs
[AD-A105028] N82-12820

PARTIAL DIFFERENTIAL EQUATIONS
A second-order accurate procedure for solving the boundary layer equations based on the predictor-corrector form of the Crank-Nicolson scheme
[NAL-TR-655T] N82-12384
A survey of some problems and recent results for parameter estimation and optimal control in delay and distributed parameter systems
[NASA-CR-16491] N82-12839
Two-dimensional mesh ajustment algorithm
[AD-A105439] N82-12853

PARTICLE ACCELERATORS
Upgrading the intense neutron source high voltage power supply
[DE81-026970] N82-12364

PARTICLE COLLISIONS
Very-high-energy nuclear physics
[DE81-030025] N82-12920

PARTICLE DIFFUSION
Deposition of particles in vertical conduits due to electrostatic charge, diffusion, and gravity
N82-12377
On the nature of the cosmic ray positron spectrum
[NASA-TM-83834] N82-13041

PARTICLE EMISSION
Radiative heat transfer in emitting, absorbing and anisotropically scattering particulate clouds
N82-12372

PARTICLE FLUX DENSITY
Project PORCUPINE: Magnetometer experiment
[BMFT-FB-W-80-026] N82-12709
On the nature of the cosmic ray positron spectrum
[NASA-TM-83834] N82-13041

PARTICLE MOTION
Dynamic behavior of particles in spacecraft
N82-12125
Lateral migration of neutrally buoyant rigid spheres in small ducts — capillary blood flow
[MPIS-20/1980] N82-12406

PARTICLE PRODUCTION
Collective effects in diffuse ambiplasma
N82-12983
On the nature of the cosmic ray positron spectrum
[NASA-TM-83834] N82-13041

PARTICLE SIZE DISTRIBUTION
Reduction of photosynthetically active radiation under extreme stratospheric aerosol loads
[DE81-030506] N82-12705

PARTICLE TRAJECTORIES
A pulse-forming network for particle path visualization — at Ames Aeromechanics Water Tunnel Facility
[NASA-TM-81311] N82-12036
The image potential and ion trajectories in SIMS
[AD-A105377] N82-12179

PASSENGER AIRCRAFT
Computer Air Carrier Symposium
[AD-A104894] N82-12054

PATTERN RECOGNITION
How a digital computer can tell that a straight line is straight
[AD-A105076] N82-12245
Comparative study of nonlinear time warping techniques in isolated word speech recognition systems
[AD-A104865] N82-12306
Vegetation patterns N82-12500
The efficiency of detecting triber patterns modulated in random dot density
[IZF-1980-25] N82-12779
Space-time clustering analysis N82-12866

PAYLOAD DELIVERY (STS)
Test progress on the electrostatic membrane reflector
[NASA-CR-165792] N82-12472

PEAT
Peat resource evaluation: State of Maine
[DE82-000227] N82-12523
Peat deposits of Dismal Swamp pocosins: Camden, Currituck, Gates, Pasquotank, and Perquimans Counties, North Carolina
[DE81-029642] N82-12524

PELLETS
Holographic study of impact phenomena — airgun pellets on ceramic targets
[TPD-1980-0-3] N82-12429

PERCEPTUAL ERRORS
Pilot estimates of glidepath and aim point during simulated landing approaches
[NASA-TM-81325] N82-12772

PERFLUORO COMPOUNDS
Thermal oxidative degradation reactions of perfluoroalkylethers
[NASA-CR-165516] N82-12135

PERFORMANCE PREDICTION
Experimental and analytical studies of advanced air cushion landing systems
[NASA-CR-3476] N82-12065
Simulator certification methods and the vertical motion simulator
[NASA-CR-166252] N82-12082
Optimization of solar heating and cooling systems
[NP-1903997] N82-12599
Comparative economic performance of selected passive solar heating and cooling technologies
[DE81-030220] N82-12600
Seasonal performance factors for active solar systems and heat-pump systems
[DE81-026569] N82-12625

PERFORMANCE TESTS
HAWK launcher shock absorber (Part number 11567877)
[AD-A105384] N82-12102
The stability and soldering void effect of large superconductor N82-12340
Evaluation of Cathode-Ray Tube protection for the electronic tabular display subsystem (ETABS) engineering model
[AD-A105199] N82-12350
Advanced cooling full-scale engine demonstration
[DE81-904253] N82-12452
Rectenna array measurement results N82-12564
Performance analysis of 11 Denver Metro passive homes
[DE81-025473] N82-12626

PERIODIC FUNCTIONS
On the manipulation of spreading rates of forced mixing layers
[AD-A105236] N82-12390

PERMEABILITY
Formation evaluation in liquid-dominated geothermal reservoirs
[DOE/ET-28384/T1] N82-12514
An investigation of sand and sandstone permeability degradation at elevated temperature and pressure
N82-12683

PERSONNEL MANAGEMENT
Guidance for implementing an environmental, safety and health assurance program. Volume 12: Model guidelines for line organization environmental, safety and health inspection and monitoring activities
[DE81-030991] N82-12668
Guidance for implementing an environmental, safety and health assurance program. Volume 13: Model guidelines for line organization environmental, safety and health meetings
[DE81-030980] N82-12669

PERSPIRATION
Sweating responses of men and women during exercise in humid and dry heat N82-12745

PERTURBATION THEORY
Application of singular perturbation theory
N82-12050
Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164963] N82-12060
Singular perturbation modeling and its application to fast algorithms of Chandrasekhar type
N82-12810
The numerical solution of Fredholm integral equations of the first kind N82-12843
Numerical methods for singularly perturbed differential equations with applications
[AD-A105366] N82-12851

PETROGRAPHY
Characterization of western coals and coal macerals by solid state nuclear magnetic resonance spectroscopy
[DE81-026928] N82-12265

PETROLEUM PRODUCTS
Models for forecasting energy use in the US farm sector
[DE81-904220] N82-12580

PH
Separation via multi-column pH parametric pumping N82-12158

PHASE CHANGE MATERIALS
Latent heat storage devices. Part 2: Heat storage media, designs and construction materials for heat of fusion storage devices
[BMVG-FBWT-79-13-PT-2] N82-12639

PHASE CONJUGATION
Studies of optical-beam phase-conjugation by nonlinear refraction
[AD-A105066] N82-12435

PHASE CONTROL
Performance analysis and simulation of the SPS reference phase control system N82-12544
Design and breadboard evaluation of the SPS reference phase control system concept
N82-12545
Coherent multiple tone technique for ground based SPS phase control N82-12546
An interferometer-based phase contml system
N82-12547
A sonic satellite power system microwave power transmission simulator N82-12548
SPS phase control studies N82-12549
SPS fiber optic link assessment N82-12550

PHASE DETECTORS
Phase sensitive guidance sensor for wire-following vehicles
[NASA-CASE-NPO-15341-1] N82-12346

PHASE ERROR
The effect of phase errors on the performance of the CAISSA antenna
[PHL-1979-45] N82-12326

PHASE LOCKED SYSTEMS
Hardware and software improvements to a paced data acquisition system for turbomachines
[AD-A104853] N82-12797

PHASE SHIFT
Neutron cross section measurements using the ORELA: The stable tellurium isotopes (n, beta), U(n,n')-238, Th(n,n')-232, Os(n,n')-187, Os(n,nn' beta)-186,187,188, and Tl(n,n beta)-205
[DE81-030164] N82-12907

PHASE TRANSFORMATIONS
Defining critical point experiments for a space laboratory N82-12110
Space-time clustering analysis N82-12866
A study of the phase transitions in benzil by Raman and Brillouin scattering techniques N82-12962
Modeling of thin-film GaAs growth
[NASA-CR-164992] N82-12965
TDPAC study of the In2Se3 crystal structure
[AD-A104729] N82-12974

PHASED ARRAYS
Optical processing for adaptive phased array radar
[AD-A105124] N82-12305
Radar imaging from a distorted array
[AD-A104803] N82-12308
Multiple-beam, high-power, precision pointing antenna system
[NASA-CASE-NPO-15406-1] N82-12345

PHONEMICS
Phonemic recognition by linear prediction: Experiment
[ENST-C-81001] N82-12323
PHOSPHORIC ACID
Soil stabilization by chemical additives — phosphoric acid and lime N82-12270
PHOSPHORIC ACID FUEL CELLS
Preparation and evaluation of advanced electrocatalysts for phosphoric acid fuel cells
[NASA-CR-165519] N82-12573
PHOTOACOUSTIC SPECTROSCOPY
Photothermal measurement of optical surface absorption using strain transducers
[AD-A104746] N82-12420
PHOTODIODES
Excess noise in tunable diode lasers
[NASA-TP-1896] N82-12431
PHOTOGEOLOGY
Remote sensing studies of some ironstone gravels and plinthite in Thailand N82-12491
Skylab explores the Earth
[NASA-SP-380] N82-12492
Global Tectonics: Some Geologic analyses of observations and photographs from Skylab N82-12494
Geological features of southwestern North America N82-12495
Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Fernandian Caldera, Galapagos Islands, Ecuador N82-12496
The Manicouagan impact structure observed from Skylab
[CONTRIB-644] N82-12497
PHOTOGRAMMETRY
Close-range cine-photogrammetry: A generalized technique for quantifying gross human motion N82-12761
PHOTOGRAPHIC FILM
Radiographic applications of spatial frequency multiplexing
[NASA-CR-166748] N82-12930
PHOTOGRAPHY
X-ray optics
[AD-A106220] N82-12935
PHOTOINTERPRETATION
Skylab explores the Earth
[NASA-SP-380] N82-12492
Visual observations of floating ice from Skylab N82-12504
Mesoscale wake clouds in Skylab photographs N82-12508
PHOTOLITHOGRAPHY
New Photolithographic methods: Projection alignment for the metallization of highly integrated circuits — alternative metallization method
[BMFT-FB-T-81-018] N82-12427
New photolithographic method for small dimension. Direct step and repeat technique (silicon repeater)
[BMFT-FB-T-81-019] N82-12428
PHOTOLYSIS
Studies of free radicals by ultraviolet excimer laser photolysis
[DE82-000888] N82-12184
PHOTOMAPPING
Desert sand seas N82-12493
Snow-mapping experiment N82-12498
An assessment of the potential contributions to oceanography from Skylab visual observations and handheld-camera photographs N82-12503
PHOTOMASKS
New photolithographic method for small dimension. Direct step and repeat technique (silicon repeater)
[BMFT-FB-T-81-019] N82-12428
PHOTON DENSITY
Measurement of the bone mineral density of trabecular bone by a coherent and Compton scattering technique N82-12747
PHOTORECONNAISSANCE
Some aspects of tropical storm structure revealed by handheld-camera photographs from space N82-12507
PHOTOSYNTHESIS
Higher plant acclimation to solar ultraviolet-B radiation N82-12737
PHOTOTROPISM
Photothermal measurement of optical surface absorption using strain transducers
[AD-A104746] N82-12420
PHOTOVOLTAIC CELLS
Intermediate photovoltaic system application experiment operational performance: Executive summary. Volume 1: For Newman Power Station, El Paso, Texas
[DE81-031934] N82-12602
Photovoltaic market analysis program: Background, model development, applications and extensions
[DE81-029711] N82-12609
Cost goals for a residential photovoltaic/thermal liquid collector system set in three northern locations
[DE81-029700] N82-12610
PHOTOVOLTAIC CONVERSION
Photovoltaic mechanisms in polycrystalline thin film silicon solar cells
[DE81-030370] N82-12606
Basis for research proposals concerning (industrial) solar energy production processes derived from biological principles N82-12640
PHYSICAL CHEMISTRY
Cryogenic deposition, desorption, and reaction studies of stratospherically relevant species N82-12161
PHYSICS AND CHEMISTRY EXPERIMENT IN SPACE
Spacecraft Dynamics as Related to Laboratory Experiments in Space — conference
[NASA-CP-2199] N82-12109
PHYSIOLOGICAL EFFECTS
Sweating responses of men and women during exercise in humid and dry heat N82-12745
PHYSIOLOGICAL RESPONSES
Gastrointestinal allergy in the experimental animal: The use of radioiodinated serum albumin in the assessment of new drugs
[IAEA-R-2067-F] N82-12741
Sweating responses of men and women during exercise in humid and dry heat N82-12745
PIEZOELECTRICITY
Piezoelectric ZnS film on silicon
[AD-A105161] N82-12359
PIEZORESISTIVE TRANSDUCERS
Development of microprocessor compatible sensors — pressure sensors
[BMFT-FB-T-80-197] N82-12365
PIGMENTS
Analysis for organic pigments using solution spectrophotometry N82-12150
PILE FOUNDATIONS
Finite element analysis of soil-sheet pile interaction N82-12268
Some aspects of skin friction of piles in clay under cyclic loading
[PB81-226730] N82-12288
PILOT ERROR
Pilot estimates of glidepath and aim point during simulated landing approaches
[NASA-TM-81325] N82-12772
PILOT PERFORMANCE
Review of human and operational factors affecting the feasibility of the see-and-avoid concept
[DFVLR-MITT-81-13] N82-12780
An investigation into pilot and system response to critical in-flight events. Volume 1: Executive summary
[NASA-CR-164993] N82-12782
An investigation into pilot and system response to critical in-flight events. Volume 2: Appendix
[NASA-CR-164994] N82-12783
PILOT PLANTS
Industrial application of fluidized-bed combustion
[DE81-030272] N82-12182
Solvent-Refined Coal (SRC) process
[DE81-031937] N82-12197
Fixed-bed gasification
[DE82-000432] N82-12261
PILOT TRAINING
Simulator certification methods and the vertical motion simulator
[NASA-CR-166252] N82-12082
PILOTS (PERSONNEL)
The heart rate of aspirant air pilots in a hypobaric chamber
[IZF-1979-35] N82-12770
PIONEER VENUS SPACECRAFT
PC-403: Pioneer Venus multiprobe spacecraft mission operational characteristics document, volume 1
[NASA-CR-166261-VOL-1] N82-12087
PC-403: Pioneer Venus multiprobe spacecraft mission operational characteristics document, volume 2
[NASA-CR-166261-VOL-2] N82-12088
PC-403: Pioneer Venus multiprobe spacecraft mission operational characteristics document, volume 3
[NASA-CR-166261-VOL-3] N82-12089
PC-402 Pioneer Venus orbiter spacecraft mission operational characteristics document
[NASA-CR-166260] N82-12090
PIONEER 10 SPACE PROBE
A study of galactic light, extragalactic light, and galactic structure using Pioneer 10 observations of background starlight N82-13040
PIPELINING (COMPUTERS)
A pipelined digital SAR azimuth correlator using hybrid FFT/transversal-filter
[NASA-CASE-NPO-15519-1] N82-12298
PIPES (TUBES)
Elastic-plastic thick-walled tubes subjected to internal pressure and temperature gradient
[AD-A105243] N82-12477
PITCH (INCLINATION)
Estimation of bias errors in angle-of-arrival measurements using platform motion
[AD-A104742] N82-12309
PITOT TUBES
On the flow measurements and velocity vector analysis using five-hole pitot tubes
[NAL-TR-666] N82-12385
PLANAR STRUCTURES
Integration of a detector array with an optical waveguide structure and applications to signal processing
[AD-A105067] N82-12932
PLANETARY ATMOSPHERES
The rigid shell component for superrotation in planetary atmospheres: Angular momentum budget, mechanical analog and simulation of the spin up process
[NASA-TM-83831] N82-13033
PLANETARY BOUNDARY LAYER
The rigid shell component for superrotation in planetary atmospheres: Angular momentum budget, mechanical analog and simulation of the spin up process
[NASA-TM-83831] N82-13033
PLANETARY MASS
The rigid shell component for superrotation in planetary atmospheres: Angular momentum budget, mechanical analog and simulation of the spin up process
[NASA-TM-83831] N82-13033
PLANETARY NEBULAE
Integrated fluxes for emission lines in the ultraviolet spectra of several planetaries
[NASA-CR-164986] N82-13022
PLANETARY ORBITS
Orbit improvement of the satellites of the outer planets
[NASA-CR-164987] N82-13037
PLANETS
The rigid shell component for superrotation in planetary atmospheres: Angular momentum budget, mechanical analog and simulation of the spin up process
[NASA-TM-83831] N82-13033
PLANT DESIGN
Magnetohydrodynamics (MHD) Engineering Test Facility (ETF) 200 MWe power plant. Design Requirements Document (DRD)
[NASA-TM-82705] N82-12446
Magnetohydrodynamics (MHD) Engineering Test Facility (ETF) 200 MWe power plant. Conceptual Design Engineering Report (CDER). Volume 1: Executive summary
[NASA-CR-165452-VOL-1] N82-12570
Investigation and research of specific combustion-turbine and combined-cycle field problems
[DE81-904231] N82-12592
PLANTS (BOTANY)
Biogeochemical evidence for subsurface hydrocarbon occurrence, recluse oil field, Wyoming: Preliminary results
[USGS-CIRC-837] N82-12693
Higher plant acclimation to solar ultraviolet-B radiation N82-12737

PLASMA CONTROL
Disruption of high beta plasma induced by resistive drift mode
[IPPJ-538] N82-12939
Electron cyclotron damping for large wave amplitude in Tokamak plasmas
[EUR-CEA-FC-1053] N82-12948
PLASMA DENSITY
Effects of preionization level on a stabilized Z-pinch
[FUPH-R-164] N82-12951
Using spectral line profiles as a diagnostic of the plasma electron density
[DE81-030313] N82-12952
Simple-power-balance model for microwave heating in EBT
[DE81-030428] N82-12953
PLASMA DIAGNOSTICS
Physics of high temperature, dense plasmas
[AD-A105169] N82-12945
PLASMA DRIFT
Disruption of high beta plasma induced by resistive drift mode
[IPPJ-538] N82-12939
PLASMA ELECTRODES
Electrode design and performance of the ORNL positive ion sources
[DE81-030426] N82-12910
PLASMA EQUILIBRIUM
Comparison of results between the ballooning modes codes BLOON and BALOON
[DE81-030259] N82-12949
PLASMA HEATING
Design analysis of supplemental heating systems
[DE81-030676] N82-12397
Design analysis of supplemental heating systems
[DE82-030677] N82-12398
Electrode design and performance of the ORNL positive ion sources
[DE81-030426] N82-12910
Novel limiter pump topologies
[DE81-030029] N82-12947
Simple-power-balance model for microwave heating in EBT
[DE81-030428] N82-12953
PLASMA PHYSICS
Physics of high temperature, dense plasmas
[AD-A105169] N82-12945
Collective effects in diffuse ambiplasma
N82-12963
PLASMA SPRAYING
Progress in protective coatings for aircraft gas turbines: A Review of NASA sponsored research
[NASA-TM-82740] N82-12216
PLASMA WAVES
Electron cyclotron damping for large wave amplitude in Tokamak plasmas
[EUR-CEA-FC-1053] N82-12948
PLASMA-ELECTROMAGNETIC INTERACTION
Simple-power-balance model for microwave heating in EBT
[DE81-030428] N82-12953
PLASMAS (PHYSICS)
Pitch-angle diffusion in canonical coordinates: A theoretical formulation
[AD-A105392] N82-12701
ECR discharge cleaning experiment in the JIPP T-11
[IPPJ-539] N82-12940
PLASTIC FLOW
Acoustic emission of plastic flow in metals and alloys N82-12209
The problem of axially symmetric flow of ideal rigid-plastic Huber-Mises medium without any specific hypotheses
[ISSN-0208-5658] N82-12463
PLASTIC PROPERTIES
Elastic-plastic thick-walled tubes subjected to internal pressure and temperature gradient
[AD-A105243] N82-12477
PLASTICS
Technical heat and flow investigations into heat exchangers made out of synthetic materials, for use in dry cooling towers
[BMFT-FB-T-81-004] N82-12407
PLATE THEORY
The response of two fluid-coupled plates to an incident pressure pulse
[AD-A104601] N82-12475
PLATES (STRUCTURAL MEMBERS)
Analysis of combustion of a composite plate
[AD-A104652] N82-12175
Influence of a multiaxial membrane stress situation on the stress concentration factor, using the example of an open unfinished drilled hole
[EK-43-B/251/79] N82-12484
PLATES (TECTONICS)
Behavioral predictions of compacted embankments on rigid foundations — in the Republic of Gabon
N82-12271
Global isostatic geoid anomalies for plate and boundary layer models of the lithosphere
[NASA-CR-164965] N82-12695
PLATING
Facing on stamping dies — testing wear resistance
[CETIM-1.3K.26.2] N82-12410
PLATINUM
Electron field emission tunneling spectroscopy of platinum group and tungsten metals in the presence of molecular gas and noble metal adsorbates
N82-12957
PLATINUM ALLOYS
Investigation of the electrochemical behavior of ion-implanted Ti-Pt alloys N82-12212
Preparation and evaluation of advanced electrocatalysts for phosphoric acid fuel cells
[NASA-CR-165519] N82-12573
PLUMES
Advanced combustion/plume diagnostics
[AD-A105115] N82-12173
PLUTONIUM ISOTOPES
Space nuclear safety and fuels program
N82-12921
PLUTONIUM OXIDES
Space nuclear safety and fuels program
N82-12921
POINTING CONTROL SYSTEMS
Ball bearing evaluation for a high precision radiometer mirror drive
[ESA-(ESTL)47] N82-12458
POISSON DENSITY FUNCTIONS
Natural exponential families with quadratic variance functions
[P-6637] N82-12844
POLAR CAPS
Matter accreting neutron stars
[NASA-TM-83835] N82-13031
POLAR REGIONS
USSR report: Earth sciences, no. 17
[JPRS-79342] N82-12489
POLARIMETRY
Investigations and applications of polarimetric and high resolution Moessbauer spectroscopy
N82-12170
Data reduction and analysis for the graphite crystal X-ray spectrometer and polarimeter experiment flown aboard OSO-8 spacecraft
[NASA-CR-166749] N82-13030
POLARIZATION (WAVES)
Investigations and applications of polarimetric and high resolution Moessbauer spectroscopy
N82-12170
POLARIZED ELECTROMAGNETIC RADIATION
Investigations and applications of polarimetric and high resolution Moessbauer spectroscopy
N82-12170
POLARIZED RADIATION
Microwave limb sounder — measuring trace gases in the upper atmosphere
[NASA-CASE-NPO-14544-1] N82-12665
POLES (SUPPORTS)
Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164963] N82-12080
POLICIES
Policy and support for research in marine life sciences N82-12651
An approach to the management of hazardous materials
[AD-A104669] N82-12987
Computer-based national information systems: Technology and public policy issues
[OTA-CIT-146] N82-12989
Computer-based national information systems: Technology and public policy issues. Summary
N82-12990
Background and purpose of the study N82-12991
The structure of information policy N82-12994
Privacy N82-12998
Regulatory and other issues N82-13001
POLISHING
Further investigation of etchants for chemically polishing SC-Cut quartz crystals
[AD-A104603] N82-12973
POLLUTION CONTROL
Fixed-bed gasification
[DE82-000432] N82-12261
Benefit-cost analysis with uncertain information: An application in air pollution control N82-12652
Combustion: An oil spill mitigation tool. Phase 2: The burning of the M/T BURMAH AGATE (ex-DANALAND)
[DE82-000527] N82-12663
Preliminary study: Use of low-sulfur coal and coal cleaning in control of acid rain
[DE81-026930] N82-12675
Environmental control technology for coal cleaning wastes
[DE81-025331] N82-12676
POLLUTION MONITORING
Development of an air sampling and analytical method for 1,6-hexamethylene diisocyanate
[AD-A105002] N82-12659
Remote determination of atmospheric gases with a DF laser
[GKSS-80-E-40] N82-12711
POLLUTION TRANSPORT
Chemical and geochemical studies off the coast of Washington
[DE81-030319] N82-12513
Three dimensional simulation model MODIS for the propagation of air pollutants
[GKSS-80-E-56] N82-12677
POLYCRYSTALS
Fatigue phenomena in copper
[RISO-M2241] N82-12225
Low-loss fiber waveguides
[AD-A104943] N82-12358
POLYETHYLENES
Orientation measurements from polymer surfaces using Fourier transform infrared photoacoustic spectroscopy
[AD-A105398] N82-12232
POLYIMIDE RESINS
Formulation and characterization of polyimide resilient foams of various densities for aircraft seating applications
[NASA-CR-167421] N82-12230
POLYMER MATRIX COMPOSITE MATERIALS
Hybridized polymer matrix composite
[NASA-CR-165340] N82-12139
POLYMERIC FILMS
Orientation measurements from polymer surfaces using Fourier transform infrared photoacoustic spectroscopy
[AD-A105398] N82-12232
POLYMERIZATION
An engineering study of bacterial kinetics and energetics N82-12740
POLYMETHYL METHACRYLATE
Molecular orientation in polymers: A study of hot-drawn polymethylmethacrylate N82-12228
POLYNOMIALS
Software modeling studies. Volume 2: The polynomial measure of complexity
[AD-A105004] N82-12826
POLYNUCLEAR ORGANIC COMPOUNDS
Identification and toxicity of fractionated-shale-oil components
[DE81-028460] N82-12766
POLYURETHANE RESINS
The effect of pressure on the physical and mechanical properties of Solithane 113 elastomer
N82-12229
POROSITY
Analysis of combustion of a composite plate
[AD-A104652] N82-12175
Effects of preignition on pulverized coal combustion
[DE81-030170] N82-12195
Strain and pore pressure behavior of fine grained soils subjected to cyclic shear loading N82-12272
POROUS MATERIALS
Significance of micropores in estimating adsorption properties of activated carbon
[VTT-39] N82-12147
Ion transport in charged porous media theory and experiments N82-12159

Diffusion of gases in capillaries
[DE82-000267] N82-12906

POSITION (LOCATION)
Military geodesy and geospace science, unit two
[AD-A106071] N82-12703

POSITIONING
Statistical averaging in position determination by holography under turbulence conditions N82-12417

POSITIVE IONS
Electrode design and performance of the ORNL positive ion sources
[DE81-030426] N82-12910

POSITRONS
On the nature of the cosmic ray positron spectrum
[NASA-TM-83834] N82-13041

POTABLE WATER
Removal of nitrates from ground waters by reverse osmosis
[BMFT-FB-T-80-155] N82-12203

POTENTIAL FLOW
Transonic airfoil design of full potential flow. 1: Numerical procedure and its computational examples
[NAL-TR-672] N82-12038
Transonic airfoil design of full potential flow. 2: Development of the FORTRAN code
[NAL-TR-673] N82-12814

POTENTIAL THEORY
Determination of a potential model for the calculation of interatomic potentials in the case of alkali-rare gas interaction
[MPIS-16/1980] N82-12912

POWDER METALLURGY
A fundamental study of fatigue in powder metallurgy aluminum alloys
[AD-A105080] N82-12219
Application of high pressures to ceramics
[AD-A105249] N82-12231

POWDERED ALUMINUM
The extinction by small aluminum particles from the far infrared to the vacuum ultraviolet N82-12960

POWER CONDITIONING
High-frequency high-voltage high-power DC-to-DC converters N82-12347
Workshop on Microwave Power Transmission and Reception. Workshop paper summaries
[NASA-TM-84064] N82-12538

POWER EFFICIENCY
A simplified power factor controller with increased energy saving circuit
[NASA-CASE-MFS-25323-1] N82-12349

POWER GAIN
Multiple-beam, high-power, precision pointing antenna system
[NASA-CASE-NPO-15406-1] N82-12345

POWER LINES
Application of Kalman filtering in computer relaying of power systems N82-12338

POWER SPECTRA
Standarized wave and wind environments for NATO operational areas
[AD-A105414] N82-12725

PRECIPITATION (CHEMISTRY)
Coprecipitated nickel-alumina methanation catalysts N82-12169
The stabilization of coal-oil mixtures N82-12237

PREDICTION ANALYSIS TECHNIQUES
A symposium on transonic flow research
[AD-A104871] N82-12044
Behavioral predictions of compacted embankments on rigid foundations --- in the Republic of Gabon N82-12271
Study of the emission performance of high-power klystrons: SLAC XK-5
[DE81-030177] N82-12362
Methods of calculating heat transfer within the passages of heat exchangers
[HTS/81/4] N82-12411
A Monte Carlo study of the use of auxiliary information in the developent of an impact acceleration injury prediction model
[AD-A105463] N82-12755
Minimum mean square error prediction of autoregressive moving average time series
[AD-A104939] N82-12848
The finite memory prediction of covariance stationary time series
[AD-A105413] N82-12878

PREFLIGHT ANALYSIS
Requirements document for mini system test unit
[NASA-CR-167436] N82-12167

PREMIXED FLAMES
Structure of laminar premixed flames of methane, methanol and their blends in oxygen N82-12164

PRESSURE CHAMBERS
The heart rate of aspirant air pilots in a hypobaric chamber
[IZF-1979-35] N82-12770

PRESSURE DISTRIBUTION
Low-speed measurements of the static pressure distribution and overall forces on a cambered and a symmetric mild gothic wing of aspect ratio 1.4
[RAE-TR-80066] N82-12027
Subcritical and supercritical airfoils for given pressure distribution N82-12031
In-duct viscous flow pressure distribution on a body with boundary layer control
[AD-A105396] N82-12394
The effect of a translating high aspect ratio particle in a plane slider bearing N82-12440

PRESSURE EFFECTS
Structure of laminar premixed flames of methane, methanol and their blends in oxygen N82-12164
The effect of pressure on the physical and mechanical properties of Solithane 113 elastomer N82-12229
Study of foaming characteristics and foaming under pressure: Deaerating lubricants and the influence of antifoaming additives
[CETIM-1.2E.12.3-PT-5] N82-12455
An investigation of sand and sandstone permeability degradation at elevated temperature and pressure N82-12583

PRESSURE PULSES
The response of two fluid-coupled plates to an incident pressure pulse
[AD-A104801] N82-12475
Damage risk criteria for impulse noise --- industrial deafness
[IZF-1980-26] N82-12771

PRESSURE SENSORS
Development of microprocessor compatible sensors --- pressure sensors
[BMFT-FB-T-80-197] N82-12365

PRESSURE VESSEL DESIGN
Mechanical properties of a 4142 steel pressure vessel for auxiliary closures
[DE81-030983] N82-12480

PRETREATMENT
Partial acid hydrolysis pretreatment for enzymatic hydrolysis of cellulose: A process development study of ethanol production N82-12236

PRIVACY
Privacy N82-12996
Constitutional rights N82-13000

PROBABILITY DISTRIBUTION FUNCTIONS
Estimation of the cumulative attenuation distribution due to rain on a path exceeding 1]lc2]km, given the cumulative distribution due to rain on a path of 1km --- 94 GHz
[PHL-1980-13] N82-12328
Discrimination rules based on marginal distributions N82-12867
Confidence interval estimation and tests for temporary outmigration in tag-recapture studies N82-12873
Fitting of negative binomial distributions using the APL program GRPFITNEG
[A-79-ST-44-24] N82-12880
PAPIN: A FORTRAN-4 program to calculate cross section probability tables, Bondarenko and transmission self-shielding factors for fertile isotopes in the unresolved resonance region
[DE81-030436] N82-12903

PROBABILITY THEORY
On probability proportional to size sampling designs: Their construction, algebraic properties, and applications N82-12871

PROBE METHOD (FORECASTING)
Log odds ratio estimation in a grouped population N82-12865

PROBLEM SOLVING
Analytical solution of anisotropic heat conduction in simple and irregular regions N82-12379
A second-order accurate procedure for solving the boundary layer equations based on the predictor-corrector form of the Crank-Nicolson scheme
[NAL-TR-655T] N82-12384
Guidance for implementing an environmental, safety and health assurance program. Volume 12: Model guidelines for line organization environmental, safety and health inspection and monitoring activities
[DE81-030991] N82-12688
Guidance for implementing an environmental, safety and health assurance program. Volume 13: Model guidelines for line organization environmental, safety and health meetings
[DE81-030980] N82-12689
Numerical experiments for solving symmetric hyperbolic systems with discontinous initial data N82-12792
Solution methods on algebra problems with simultaneous equations
[AD-A105178] N82-12852
A numerical solution for two-dimensional Fredholm integral equations of-the second kind with kernels of the logarithmic potential form
[NASA-TM-81299] N82-12885

PROCESS CONTROL (INDUSTRY)
Control of high purity distillation columns N82-12160
Application of high pressures to ceramics
[AD-A105249] N82-12231
Human control and regulation tasks N82-12787
Evaluation of microprocessors for process control applications N82-12607

PROCESS HEAT
Guidebook for solar process-heat applications
[DE81-027977] N82-12598
Comparative economics of solar thermal central receivers
[DE81-029623] N82-12601
Status of solar energy research and development in Australia
[NP-1903916] N82-12611
Solar thermal central receivers for industrial process heat generation: User views and recommendations for commercialization
[DE81-029611] N82-12618

PRODUCT DEVELOPMENT
High field superconductors of NbTi with current capacities in excess of 3000A for application in magnet systems with alternating field components
[BMFT-FB-T-81-009] N82-12367
Development of MOS memories
[BMFT-FB-T-80-161] N82-12803

PRODUCTION COSTS
Assessment of potential future markets for the production of hydrogen from water
[BMFT-FB-T-81-012] N82-12266
Manufacturing and cost evaluation of second generation heliostats. Volume 2: Appendices
[DE82-000232] N82-12617

PROGRAM VERIFICATION (COMPUTERS)
Error propagation and elimination in computer programs
[AD-A105437] N82-12822
Software modeling studies. Volume 4: A statistical theory of computer program testing
[AD-A105078] N82-12825
Two theorems about the completeness of Hoare's logic
[MC-IW-165/81] N82-12862

PROGRAMMED INSTRUCTION
Modular implementation of a digital hardware design automation system N82-12333

PROGRAMMING LANGUAGES
The GLAS editing procedures for the FGGE level II-B data collected during SOP-1 and 2
[NASA-TM-83811] N82-12794
SISU: A programming language for computational linguistics, with an application to the analysis of Finnish N82-12809
Recognize regular languages with programmable building blocks
[AD-A104874] N82-12816
Schemes for communication --- interprocessor communication
[AD-A104791] N82-12819
Correctness of programs with function procedures
[MC-IW-170/81] N82-12833
Abstract data types and data bases N82-13005

PROJECT MANAGEMENT
Project impact analysis as an optimal control problem --- irrigation and hydroelectric power project
[DE81-028465] N82-12642

PROJECT PLANNING

Study to define an approach for developing a computer-based system capable of automatic, unattended assembly/disassembly of spacecraft, phase 1
[NASA-CR-166740] N82-12092

Project for reliability fleet testing of alcohol/gasoline blends
[DE82-000004] N82-12250

PROJECTILES

Automatic plotting routines for estimating static aerodynamic properties of long rod finned projectiles for 2,M,5
[AD-A104900] N82-12046

PROJECTS

Department of Energy projects
[DE82-000038] N82-12579

PROPAGATION MODES

Determination of crustal Q structure from multi-mode surface waves N82-12682

Investigations of the reflection, transmission, and conversion of ultrasonic waves N82-12588

PROPELLANT BINDERS

Combustion mechanisms of solid propellants
[AD-A105163] N82-12244

PROPELLANT STORABILITY

W76 elastomers/propellant compatibility
[DE81-031933] N82-12258

PROPELLER BLADES

An analysis of civil aviation propeller-to-person accidents: 1965-1979
[AD-A105365] N82-12053

PROPORTIONAL COUNTERS

Coordinate measurement by current division: A simple system for multichannel detectors
[DE81-030176] N82-12423

PROPULSION SYSTEM PERFORMANCE

A look inside the Langley 16-foot transonic tunnel: User's guide
[NASA-TM-83186] N82-12065

PROTECTION

Evaluation of Cathode-Ray Tube protection for the electronic tabular display subsystem (ETABS) engineering model
[AD-A105199] N82-12350

PROTECTIVE CLOTHING

The handling, hazards, and maintenance of heavy liquids in the geologic laboratory
[USGS-CIRC-827] N82-12273

Anti-exposure technology identification for mission specific operational requirements
[AD-A105070] N82-12784

Zipper rear closure endurance testing
[AD-A104732] N82-12785

PROTECTIVE COATINGS

Progress in protective coatings for aircraft gas turbines: A Review of NASA sponsored research
[NASA-TM-82740] N82-12216

Paint selection for coating radioactive-waste drums
[DE81-026259] N82-12234

Facing on stamping dies — testing wear resistance
[CETIM-1.3K.26.2] N82-12460

PROTEINS

Oxygen toxicity and lung collagenous protein
[AD-A104702] N82-12756

PROTON BEAMS

Intense proton beam excitation of a high pressure argon-nitrogen laser N82-12430

PROTON ENERGY

Inclusive proton spectra and total reaction cross sections for proton-nucleus scattering at 800 MeV
[DE81-030505] N82-12906

PROTON SCATTERING

Inclusive proton spectra and total reaction cross sections for proton-nucleus scattering at 800 MeV
[DE81-030505] N82-12906

PSYCHOACOUSTICS

Effects of activity interference on annoyance due to aircraft noise
[NASA-TP-1938] N82-12654

PSYCHOMOTOR PERFORMANCE

Levels of steering control: Reproduction of steering wheel movements
[IZF-1980-16] N82-12777

PULMONARY CIRCULATION

Three-dimensional stress distribution in arteries: Radial compression experiments of arterial wall; stress concentration in lung near a cylindrical cavity; finite element analysis of pleural surface pressure distribution in dog's lung during electrophrenic stimulation N82-12750

Oxygen toxicity and lung collagenous protein
[AD-A104702] N82-12756

PULSE CODE MODULATION

Application of Pulse Code Modulation (PCM) technology to aircraft dynamics data acquisition
[AD-A104775] N82-12068

Characteristics of a code division multiplex configuration with direct modulation
[REPT-442-TBR-61] N82-12318

PULSE COMMUNICATION

Bandwidth constrained signal design for digital communication over Rayleigh Fading channels and Partial Band interference channels N82-12293

PULSE COMPRESSION

Phoenix 2 energy extraction and angular multiplexing experiments — laser fusion reactors
[DE81-028972] N82-12919

PULSE DURATION

A pulse-forming network for particle path visualization — at Ames Aeromechanics Water Tunnel Facility
[NASA-TM-81311] N82-12036

PULSED LASERS

Scaling laws for pulsed chain-reaction chemical lasers
[AD-A104752] N82-12436

Phoenix 2 energy extraction and angular multiplexing experiments — laser fusion reactors
[DE81-028972] N82-12919

PUMPS

Separation via multi-column pH parametric pumping N82-12158

A high pressure hydraulic pump: GHP 1000 description
[CETIM-5.42.24.0] N82-12457

PURITY

Control of high purity distillation columns
N82-12160

PYROLYSIS

Pyrolysis of coal-drived fuels using the laser-powered homogeneous pyrolysis technique
[DE82-000251] N82-12196

Q

Q VALUES

Determination of crustal Q structure from multi-mode surface waves N82-12682

QUADRATIC EQUATIONS

Natural exponential families with quadratic variance functions
[P-6637] N82-12844

The distribution of quadratic forms in normal variables with applications to the comparison of variable selection criteria N82-12872

QUADRATURES

Modified multilag methods for Volterra functional equations
[MC-NW-108/01] N82-12861

QUALITATIVE ANALYSIS

Determination and analysis of jet and missile fuel deposits
[AD-A105458] N82-12248

QUALITY CONTROL

Silicon quality: A consideration for VHSI circuit development
[AD-A105198] N82-12355

QUANTILES

A quantile function approach to the k-sample quantile regression problem N82-12870

QUANTITATIVE ANALYSIS

Electrophotolysis oxidation system for measurement of organic concentration in water
[NASA-CASE-MSC-16497-1] N82-12166

Secondary ion mass spectrometric image depth profiling for three-dimensional elemental analysis
[AD-A105092] N82-12172

Inductively coupled plasma as an ion source for the determination of trace elements in solutions by mass spectrometry
[DE81-030744] N82-12192

Synchronous fluorescence/matrix isolation method for trace organic analysis
[DE81-030958] N82-12193

Method and apparatus for detecting coliform organisms
[NASA-CASE-ARC-11322-1] N82-12739

Development of elemental analyzer to programmable calculator interface
[DE82-000895] N82-12802

QUANTUM CHROMODYNAMICS

Instanton effects in the equation of state for dense neutron star matter
[HU-TFT-79-19] N82-13023

QUANTUM EFFICIENCY

Research and development on new technologies for the preparation of III-V semiconductor materials and on methods for evaluation of the quality of these materials. Project Ga(AsP) expitaxial layers and substrates for them
[BMFT-FB-T-81-020] N82-12962

QUANTUM ELECTRODYNAMICS

Fundamental tests and measures of the structure of matter at short distances
[DE81-030644] N82-12976

QUARTZ CRYSTALS

Further investigation of etchants for chemically polishing SC-Cut quartz crystals
[AD-A104903] N82-12973

Automated X-ray orientation for quartz crystal resonators
[AD-A104945] N82-12977

QUASARS

X-ray imaging observations of the radio galaxies Cen A, Vir A, and 3C273 N82-13021

QUEBEC

The Manicouagan impact structure observed from Skylab
[CONTRIB-544] N82-12497

QUEUEING THEORY

Message queueing delays in polling schemes with applications to data communication networks
N82-12294

R

RADAR ANTENNAS

The effect of phase errors on the performance of the CAISSA antenna
[PHL-1979-45] N82-12326

RADAR ASTRONOMY

Radar investigation of asteroids
[NASA-CR-164997] N82-13036

RADAR CROSS SECTIONS

Radar investigation of asteroids
[NASA-CR-164997] N82-13036

RADAR DETECTION

Moving target Detector/Airport Surveillance radar (ASR-7) field evaluation
[AD-A105196] N82-12303

RADAR ECHOES

Radar investigation of asteroids
[NASA-CR-164997] N82-13036

RADAR EQUIPMENT

Use of Sandia's Central Receiver Test Facility as a high-intensity heat source for testing missile nose-cone (radome) radar systems
[DE82-000968] N82-12086

RADAR IMAGERY

Real-time multiple-look synthetic aperture radar processor for spacecraft applications
[NASA-CASE-NPO-14054-1] N82-12297

Radar imaging from a distorted array
[AD-A104803] N82-12308

RADAR SCANNING

Reduction of multipath fading in radio relay links based on the principle of optimum beam scan
[REPT-455-TBR-71] N82-12320

RADAR SCATTERING

Progress in radar snow research — Brookings, South Dakota
[NASA-CR-166709] N82-12510

RADAR TARGETS

Evaluation of the performance of a simplified MTI canceller selection rule for FUCAS — radar target selection
[PHL-1981-24] N82-12330

RADAR TRACKING
Tracking procedures for FUCAS — phased array radar
[PHL-1980-45] N82-12329
RADAR TRANSMISSION
Optical processing for adaptive phased array radar
[AD-A105124] N82-12305
RADIANT FLUX DENSITY
A new power meter concept for high energy lasers
[AD-A104824] N82-12432
Ionospheric power beam studies N82-12542
Integrated fluxes for emission lines in the ultraviolet spectra of several planetaries
[NASA-CR-164866] N82-13022
RADIATION ABSORPTION
Chemical protection of cells in culture and mice against X-irradiation
[MBL-1979-2] N82-12743
RADIATION BELTS
Pitch-angle diffusion in canonical coordinates: A theoretical formulation
[AD-A105362] N82-12701
RADIATION CHEMISTRY
Radiation effects on living systems. A bibliography of AECL publications
[AECL-6797] N82-12759
RADIATION DAMAGE
Repair of chemical damage in mammalian cells
[DE81-030823] N82-12757
RADIATION DOSAGE
Biological effects of low doses of ionizing radiation: Three review papers
[AECL-7059] N82-12758
Gonadal doses from radiotherapy
[ARL/TR-020] N82-12762
Genetic and mean bone-marrow doses from medical use of unsealed radioisotopes
[ARL/TR-023] N82-12763
Contributions to the genetic and mean bone-marrow doses of the Australian population from radiological procedures
[ARL/TR-017] N82-12764
RADIATION EFFECTS
Metals and ceramics division materials science program
[DE81-030697] N82-12137
Experimental investigation of the influence of high power ultrasound on metals N82-12211
Testing of solar cell covers and encapsulants conducted in a simulated space environment
[NASA-CR-165475] N82-12571
Radiation effects on living systems. A bibliography of AECL publications
[AECL-6797] N82-12759
RADIATION PROTECTION
Chemical protection of cells in culture and mice against X-irradiation
[MBL-1979-2] N82-12743
Overview of the biomedical and environmental programs at the Oak Ridge National Laboratory
[DE81-027864] N82-12765
RADIATION SHIELDING
PAPIN: A FORTRAN-4 program to calculate cross section probability tables, Bondarenko and transmission self-shielding factors for fertile isotopes in the unresolved resonance region
[DE81-030436] N82-12903
RADIATION THERAPY
Gonadal doses from radiotherapy
[ARL/TR-020] N82-12762
RADIATIVE HEAT TRANSFER
Radiative heat transfer in emitting, absorbing and anisotropically scattering particulate clouds
N82-12372
RADIATIVE TRANSFER
Reduction of photosynthetically active radiation under extreme stratospheric aerosol loads
[DE81-030506] N82-12705
RADIO ALTIMETERS
The use of groundspeed, in a wind shear and the flight evaluation of a radar-altimeter-based system for the measurement of groundspeed
[AD-A104758] N82-12060
RADIO COMMUNICATION
Feasibility study of device synthesis of non-linear filters
[AD-A105417] N82-12354
RADIO FREQUENCIES
Medical diagnostic application of radiofrequency range electromagnetic waves N82-12746
RADIO GALAXIES
X-ray imaging observations of the radio galaxies Cen A, Vir A, and 3C273 N82-13021
RADIO RELAY SYSTEMS
Reduction of multipath fading in radio relay links based on the principle of optimum beam scan
[REPT-455-TBR-71] N82-12320
RADIO TELEMETRY
Payload/orbiter signal-processing and data-handling system evaluation
[NASA-CR-161007] N82-12107
RADIOACTIVE ISOTOPES
A radionuclide counting technique for measuring wind velocity — drag force anemometers
[NASA-TM-83202] N82-12419
Studies in erythropoiesis: The influence of the glycocalyx of the red cell membrane
[DE81-030888] N82-12760
Genetic and mean bone-marrow doses from medical use of unsealed radioisotopes
[ARL/TR-023] N82-12763
RADIOACTIVE MATERIALS
Evaluation of active and passive near-millimeter-wave radiometric imaging techniques for detection of concealed objects
[DE81-031938] N82-12316
RADIOACTIVE WASTES
Paint selection for coating radioactive-waste drums
[DE81-026259] N82-12234
Geochemical modeling: A review
[DE81-028969] N82-12708
Method and system for nuclear waste disposal — control valves for encapsulating wastes
[NASA-CASE-NPO-15454-1] N82-12916
Is spent fuel or waste from reprocessed spent fuel simpler to dispose of?
[EMD-81-78] N82-12917
Survey of matrix materials for solidified radioactive high-level waste
[DE82-000708] N82-12922
Low-level radioactive waste: An introductory overview
[DE81-026334] N82-12924
Process for the denitrification of high-level radioactive liquid wastes
[DE81-026875] N82-12925
Nuclear waste incineration technology status
[DE81-025751] N82-12926
Monitor for detecting nuclear waste leakage in a subsurface repository
[DE81-026429] N82-12927
RADIOBIOLOGY
Radiation effects on living systems. A bibliography of AECL publications
[AECL-6797] N82-12759
RADIOGRAPHY
Evaluation of active and passive near-millimeter-wave radiometric imaging techniques for detection of concealed objects
[DE81-031938] N82-12316
Measurement of gonadal and bone-marrow doses from dental radiography
[ARL/TR-022] N82-12761
Radiographic applications of spatial frequency multiplexing
[NASA-CR-166748] N82-12930
RADIOLOGY
Contributions to the genetic and mean bone-marrow doses of the Australian population from radiological procedures
[ARL/TR-017] N82-12764
Radiographic applications of spatial frequency multiplexing
[NASA-CR-166748] N82-12930
RADIOMETERS
Ball bearing evaluation for a high precision radiometer mirror drive
[ESA-(ESTL)47] N82-12456
RADOMES
Use of Sandia's Central Receiver Test Facility as a high-intensity heat source for testing missile nose-cone (radome) radar systems
[DE82-000908] N82-12066
RADON
Midway house-tightening project: A study of indoor air quality — concentrations of radon formaldehyde, and nitrogen dioxide
[DE81-030686] N82-12277
RAIL TRANSPORTATION
Evaluation of novel underground transport systems
[DE81-030279] N82-12520
RAIN
Handbook for the estimation of microwave propagation effects: Link calculations for earth-space paths (path loss and noise estimation)
[NASA-CR-165002] N82-12301
Estimation of the cumulative attenuation distribution due to rain on a path exceeding 1]lc2]km, given the cumulative distribution due to rain on a path of 1km — 94 GHz
[PHL-1980-13] N82-12328
RAMAN SPECTRA
A study of the phase transitions in benzil by Raman and Brillouin scattering techniques N82-12962
RAMAN SPECTROSCOPY
CARS spectroscopy of gun propellant flames
[AD-A105224] N82-12177
Laser systems for the Combustion Research Facility: Orion
[DE81-030989] N82-12437
RANDOM ACCESS MEMORY
Development of MOS memories
[BMFT-FB-T-80-161] N82-12603
RANDOM NOISE
Acoustic and vibration environments for laboratory experiments in space N82-12130
Optimal adaptive stochastic control of linear dynamical systems with multiplicative and additive noise N82-12868
RANDOM PROCESSES
Norm conditions for the path regularity of random processes
[CTH-MATH-1981-12] N82-12681
RANDOM SIGNALS
The efficiency of detecting tribar patterns modulated in random dot density
[IZF-1980-25] N82-12779
RANDOM VARIABLES
The distribution of quadratic forms in normal variables with applications to the comparison of variable selection criteria N82-12872
RANDOM VIBRATION
Acoustic and vibration environments for laboratory experiments in space N82-12130
RANGE AND RANGE RATE TRACKING
Prompt detection of aircraft maneuvers by use of range rate radar data
[AD-A105083] N82-12302
RANGELANDS
Vegetation patterns N82-12500
RARE EARTH ALLOYS
A systematic study of the effects of 3d, 4f and 5f impurities on the critical temperature of superconducting Th; measurements to 20 kilobars
N82-12958
RARE GASES
Interaction potentials between rare gas atoms and hologen atoms
[AD-A104836] N82-12899
Determination of a potential model for the calculation of interatomic potentials in the case of alkali-rare gas interaction
[MPIS-16/1980] N82-12912
RATIOS
Optimal integer and fractional covers: A sharp bound on their ratio
[AD-A104829] N82-12686
RAYLEIGH DISTRIBUTION
Stabilization of Rayleigh-Taylor instability due to the spontaneous magnetic field in laser produced plasma
[IPPJ-537] N82-12942
RAYLEIGH SCATTERING
The Rayleigh-Taylor and Kelvin-Helmholtz instabilities in targets accelerated by laser ablation
[AD-A104804] N82-12433
RAYLEIGH WAVES
Determination of crustal Q structure from multi-mode surface waves N82-12682
REACTION KINETICS
Reactions of tributylstannyl anioniods with alkyl bromides
[AD-A105433] N82-12136
The kinetics of the reverse Deacon reaction
N82-12152
Electronic excitation in molecular collisions: Structural, dynamic and kinetic considerations
[AD-A105054] N82-12174

Acetylene terminated phenylene thermoset systems
[AD-A105394] N82-12176
Chemistry of combustion of fuel-water mixtures
[AD-A105401] N82-12178
Studies of free radicals by ultraviolet excimer laser photolysis
[DE82-000666] N82-12184
Palladium-catalyzed coupling reactions: Mechanism of reductive elimination
[DE81-030169] N82-12186
Solid-solid reactions in coal conversion processes
N82-12236
Microbial methane fermentation kinetics for toxicant exposure
[AD-A104666] N82-12243
Combustion mechanisms of solid propellants
[AD-A105163] N82-12244
Development of hydroconversion of biomass to synthetic fuels
[DE81-030954] N82-12260
Voltage losses and reconditioning of NICd cells: Behavior during cycling
[AD-A105418] N82-12575
Impedance and mass transport kinetics of nickel cadmium cells
[AD-A105320] N82-12576
Lagrangian measurements of sulfur dioxide to sulfate conversion rates
[DE82-000246] N82-12665
Kinetics of wet oxidation of biological sludges from coal-conversion wastewater treatment
[DE82-000525] N82-12674
Geochemical modeling: A review
[DE81-028969] N82-12706

REACTION PRODUCTS
Solid-solid reactions in coal conversion processes
N82-12236

REACTIVITY
Interaction potentials between rare gas atoms and hologen atoms
[AD-A104836] N82-12899

REACTOR DESIGN
Dynamic modeling and control structures for a tubular autothermal reactor at an unstable state
N82-12162

REACTOR MATERIALS
Miniaturized fatigue crack growth specimen technology and results
[DE81-029757] N82-12481

REACTOR SAFETY
Propagation of a liquid-liquid explosion
[DE81-030780] N82-12252

READ-ONLY MEMORY DEVICES
Development of MOS memories
[BMFT-FB-T-80-161] N82-12803

REAL TIME OPERATION
Real-time multiple-look synthetic aperture radar processor for spacecraft applications
[NASA-CASE-NPO-14054-1] N82-12297
Nonlinear real-time optical signal processing
[AD-A105186] N82-12796
An operational approach to requirements specification for embedded systems
[AD-A105459] N82-12821

RECEIVERS
Design study report for General Aviation Loran-C receiver
[AD-A104921] N82-12062

RECOGNITION
Recognize regular languages with programmable building blocks
[AD-A104874] N82-12816

RECTANGLES
Analytical solution of anisotropic heat conduction in simple and irregular regions N82-12379

RECTANGULAR PLATES
Buckling of a thin initially wrinkled rectangular plate
[DE81-029863] N82-12479

RECTENNAS
Design and breadboard evaluation of the SPS reference phase control system concept
N82-12545
The history of the development of the rectenna
N82-12560
Rectenna system design N82-12561
Rectenna session: Micro aspects N82-12562
A theoretical study of microwave beam absorption by a rectenna N82-12563
Rectenna array measurement results N82-12564
Session on solid state: Introduction N82-12565
Solid-state retrodirective phased array concepts for microwave power transmission from Solar Power Satellite N82-12566

RECURSIVE FUNCTIONS
On finite word length effects of second order recursive digital filters N82-12334
Correctness of programs with function procedures
[MC-IW-170/81] N82-12833

RECYCLING
Fines recycle modeling for an atmospheric fluidized-bed coal combustor — combustion efficiency
[DE81-904223] N82-12185

RED SHIFT
Investigations and applications of polarimetric and high resolution Moessbauer spectroscopy
N82-12170

REDOX CELLS
Performance of advanced chromium electrodes for the NASA Redox Energy Storage System
[NASA-TM-82724] N82-12574

REDUCED GRAVITY
Defining critical point experiments for a space laboratory N82-12110
Two-phase flow and heat transfer under low gravity N82-12116
Convection in fluids at reduced gravity
N82-12119
Transient thermal convection in microgravity
N82-12121

REDUCTION (CHEMISTRY)
Palladium-catalyzed coupling reactions: Mechanism of reductive elimination
[DE81-030169] N82-12186
Development of a process for recovery of valuable components from complex hydrodesulfurization catalysts especially tungsten, molybdenum, vanadium, nickel and cobalt
[BMFT-FB-T-80-186] N82-12204

REDUNDANCY
Study on strapdown inertial navigation redundant sensor system
[NAL-TR-660] N82-12056
Use of on-chip redundancy for fault-tolerant very large scale integrated circuit design N82-12332
Redundancy versus query time trade-offs for data structures N82-13004

REFINING
Solvent-Refined Coal (SRC) process
[DE81-031937] N82-12197
Liquidus temperatures of commercial ESR slags
[AD-A105266] N82-12217

REFLECTANCE
Optical constants of boron carbide
[AD-A105451] N82-12975
Metallic film thickness requirements for mirrors in the infrared — United Kingdom infrared telescope (UKIRT)
[UKIRT-13] N82-13026

REFLECTOMETERS
Infrared reflectance and refractive index measurements in vacuum-rated hemiellipsoidal mirror reflectometer from 20 to 300 deg K — gas condensates on mirror surfaces
[AD-A105113] N82-12933

REFLECTORS
Test progress on the electrostatic membrane reflector
[NASA-CR-165792] N82-12472

REFRACTION
Studies of optical-beam phase-conjugation by nonlinear refraction
[AD-A105066] N82-12435

REFRACTIVITY
Aerodynamic measurements concerned with a turret model
[NASA-CR-166264] N82-12034
Multiple electromagnetic scattering from a cluster of spheres. Volume 1: Theory
[AD-A105453] N82-12310
Infrared reflectance and refractive index measurements in vacuum-rated hemiellipsoidal mirror reflectometer from 20 to 300 deg K — gas condensates on mirror surfaces
[AD-A105113] N82-12933

REFRACTOMETERS
Infrared reflectance and refractive index measurements in vacuum-rated hemiellipsoidal mirror reflectometer from 20 to 300 deg K — gas condensates on mirror surfaces
[AD-A105113] N82-12933

REFRACTORY MATERIALS
Field emission cold cathode devices based on eutectic systems
[AD-A104795] N82-12357

REFRIGERATING
Materials for magnetic refrigeration between 2 and 20 K
[DE81-024031] N82-12284

REGENERATION (ENGINEERING)
High-temperature counter-flow recuperator
[DE81-031923] N82-12424
Utilization of waste heat from major transformer substations. Volume 1: Generic study
[DE81-[illegible]4212] N82-12593
Utilization of waste heat from major transformer substations. Volume 2: Site-specific study
[DE81-904236] N82-12594

REGRESSION ANALYSIS
A regression design approach to optimal and robust spacing selection
[AD-A104728] N82-12846
Autoregressive spectral estimation, log spectral smoothing and entropy
[AD-A104940] N82-12849
A quantile function approach to the k-sample quantile regression problem N82-12870

REGULATIONS
Photovoltaic market analysis program: Background, model development, applications and extensions
[DE81-029711] N82-12609
The structure of information policy N82-12994
Regulatory and other issues N82-13001

REINFORCED PLASTICS
Laminated anisotropic reinforced plastic plates and shells
[NASA-TM-76565] N82-12474

REINFORCING FIBERS
Hybridized polymer matrix composite
[NASA-CR-165340] N82-12139

REINFORCING MATERIALS
The behavior and strength of lapped splices in reinforced concrete beams subjected to cyclic loading N82-12470

RELATIVISTIC ELECTRON BEAMS
Dynamics of an intense relativistic electron beam injected into full density air
[AD-A104743] N82-12901
Axial translation of field-reversing relativistic electron rings N82-12915
Experiments with waves on relativistic electron beams
[AD-A105094] N82-12916
Physics of high temperature, dense plasmas
[AD-A105169] N82-12945

RELAXATION TIME
Nuclear magnetic resonance studies of solid krypton N82-12961

RELIABILITY
Project for reliability fleet testing of alcohol/gasoline blends
[DE82-000004] N82-12250
Field emission cold cathode devices based on eutectic systems
[AD-A104795] N82-12357

RELIABILITY ANALYSIS
Reliability analysis of the F-8 digital fly-by-wire system
[NASA-CR-163110] N82-12079

REMOTE MANIPULATOR SYSTEM
Space Construction Experiment Definition Study (SCEDS), part 1. Volume 1: Executive summary
[NASA-CR-167456] N82-12094
Space Construction Experiment Definition Study (SCEDS), part 1. Volume 2: Study results
[NASA-CR-167432] N82-12095

REMOTE SENSING
Limit on remote FTIR detection of trace gases
[AD-A104842] N82-12511
SAGE measurements of the stratospheric aerosol dispersion and loading from the Soufriere Volcano
[NASA-TP-1922] N82-12687
Remote determination of atmospheric gases with a DF laser
[GKSS-80-E-40] N82-12711

RESEARCH

Policy and support for research in marine life sciences N82-12651

Research activities report of the Institute of Sound and Vibration Research N82-12694

RESEARCH AND DEVELOPMENT

Research and development work concerning a fiber reinforced plastic material which is isoelastic to bone [BMFT-FB-T-80-083] N82-12146

Inventory of medical technological research in the Netherlands N82-12767

Innovation, productivity, and employment N82-12995

RESEARCH FACILITIES

Japanese Research institutes funded by the Ministry of Education [ONRT-M2] N82-13042

RESEARCH MANAGEMENT

Modeling as a tool — in biology [PUBL-252] N82-12488

Biomedical research [NASA-CR-3487] N82-12751

RESERVOIRS

Formation evaluation in liquid-dominated geothermal reservoirs [DOE/ET-28384/T1] N82-12514

Resource assessment of Low and Moderate-temperature geothermal waters in Calistoga, Napa County, California [DE81-025559] N82-12518

Water resources data for New York, water year 1980. Volume 1: Eastern New York excluding Long Island [PB81-227308] N82-12534

Water resources data for New York, water year 1980. Volume 3: Western New York [PB81-227316] N82-12535

RESIDENTIAL ENERGY

Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 1: Energy-conserving design for residential structures [DE82-900206] N82-12278

Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 2: Domestic hot water systems [DE82-900207] N82-12279

Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 3: Customer load management systems [DE82-900208] N82-12280

Comparison of residential window distributions and effects of mass and insulation [DE81-027936] N82-12283

Assessment of the potential of coal-fueled heat engines in total and integrated energy systems [DE82-000169] N82-12587

Technology assessment of solar energy systems: Residential use of fuelwood in the Pacific Northwest [DE82-000046] N82-12603

Cost goals for a residential photovoltaic/thermal liquid collector system set in three northern locations [DE81-029700] N82-12610

Economic implications of passive-solar retrofit for single-family residences in Albuquerque, New Mexico: A case study [DE81-028402] N82-12630

Fuel savings in hot water heating plants by application of heat pumps operated with natural gas (natural gas heat pump). Project: gas engine [BMFT-FB-T-80-125] N82-12641

RESIDUAL STRESS

IN situ goniometer — for industrial residual stress measurement [CETIM-5.41.22.0-PT-1] N82-12485

RESIDUES

Technology assessment of solar energy systems: Potential soil erosion effects of harvesting crop residues for energy production [DE82-000149] N82-12606

Costs for alternative grain-residue-collection systems [DE81-029072] N82-12633

RESINS

The effect of resin on the impact damage tolerance of graphite-epoxy laminates [NASA-TM-83213] N82-12140

RESOLUTION

Coordinate measurement by current division: A simple system for multichannel detectors [DE81-030178] N82-12423

RESONANCE

Experimental demonstration of Feshbach resonances in atom-molecule scattering, with the help of measurements on the H2(pH2)-Kr and HD-Xe systems [MPIS-14/1980] N82-12913

RESOURCE ALLOCATION

Maritime support for ocean-resources development [AD-A104730] N82-12735

RESPIRATION

Medical diagnostic application of radiofrequency range electromagnetic waves N82-12746

RESPIRATORY SYSTEM

Oxygen toxicity and lung collagenous protein [AD-A104702] N82-12756

RESPONSE TIME (COMPUTERS)

Identification of the adaptive feedback of the human motor system using the response difference method N82-12754

RETORT PROCESSING

Investigation of factors affecting the in-situ combustion retorting of oil shale [DE82-000482] N82-12200

RETROFITTING

Retrofit and acceptance test of 30-cm ion thrusters [NASA-CR-165259] N82-12133

Passive-solar-retrofit study for the United States Navy [DE81-028921] N82-12629

Economic implications of passive-solar retrofit for single-family residences in Albuquerque, New Mexico: A case study [DE81-028402] N82-12630

RETROREFLECTORS

Study of hollow corner retroreflectors for use in a synchronous orbit [NASA-CR-166750] N82-12931

REVERSE FIELD PINCH

Effects of preionization level on a stabilized Z-pinch [FUPH-R-164] N82-12951

REVERSE OSMOSIS

Removal of nitrates from ground waters by reverse osmosis [BMFT-FB-T-80-155] N82-12203

REVERSED FLOW

Prediction of the incompressible flow over a rearward-facing step N82-12376

REVIEWING

The GKS reviewing process — computer graphics and the graphical kernel system (GKS) [MC-IW-164/81] N82-12831

RICCATI EQUATION

Computational methods of robust controller design for aerodynamic flutter suppression [NASA-CR-164983] N82-12080

RIGID ROTORS

Performance and loads data from a wind tunnel test of a full-scale, coaxial, hingeless rotor helicopter [NASA-TM-81329] N82-12040

RIGID STRUCTURES

Surface chemical reactions on stationary or rotating bodies in nonisothermal laminar boundary layer flows N82-12153

Wave induced vibrations of continuous floating structures N82-12467

RISK

Damage risk criteria for impulse noise — industrial deafness [IZF-1980-26] N82-12771

Society's dependence on information systems N82-12999

RIVERS

Visual observations of floating ice from Skylab N82-12504

ROADS

Cultural features imaged and observed from Skylab 4 N82-12499

ROBUSTNESS (MATHEMATICS)

A regression design approach to optimal and robust spacing selection [AD-A104726] N82-12846

ROCKET EXHAUST

Application of the three beam laser cross correlation technique in the exhaust plume of a liquid fuelled rocket motor [AASU-343] N82-12134

ROCKET THRUST

Exceedance statistics of accelerations resulting from thruster firings on the Apollo-Soyuz mission N82-12127

ROLL

Experimental and analytical studies of advanced air cushion landing systems [NASA-CR-3476] N82-12065

Research developing closed loop roll control for magnetic balance systems [NASA-CR-164989] N82-12084

ROLLERS

Design study of a continuously variable roller cone traction CVT for electric vehicles [NASA-CR-159841] N82-12445

ROLLING MOMENTS

Effects of aerodynamic coupling on the dynamics of roll aircraft N82-12070

Yawsonde tests of 2.75-inch Mk66 mod 1rocket [AD-A104904] N82-12101

ROOM TEMPERATURE

Strength evaluation test of hot-pressed silicon nitride at room temperature [NAL-TR-676] N82-12138

ROOT-MEAN-SQUARE ERRORS

Minimum mean square error prediction of autoregressive moving average time series [AD-A104939] N82-12848

ROTATING BODIES

Surface chemical reactions on stationary or rotating bodies in nonisothermal laminar boundary layer flows N82-12153

ROTATING SHAFTS

Calculation and measurement of the turbulence of an incompressible flow in a labyrinth seal between a rotating shaft and a cylinder at rest [EPFL-ITA-8] N82-12382

ROTOR AERODYNAMICS

Performance and loads data from a wind tunnel test of a full-scale, coaxial, hingeless rotor helicopter [NASA-TM-81329] N82-12040

Experimental and analytical studies of a model helicopter rotor in hover [NASA-TM-81232] N82-12042

German-Argentine experiment: Vertical-rotor wind engine N82-12648

ROTORS

Assessment of rotor-bearing dynamics: A planning study for the utility industry [DE81-904242] N82-12451

RUNGE-KUTTA METHOD

Instructive experiments with Runge-Kutta-Rosenbruck methods [MC-NW-100/81] N82-12856

On the practical value of the notion of BN-stability [MC-NW-101/81] N82-12857

A special class of multistep Runge-Kutta methods with extended real stability interval [MC-NW-106/81] N82-12860

Modified multilag methods for Volterra functional equations [MC-NW-108/01] N82-12861

RURAL AREAS

Cultural features imaged and observed from Skylab 4 N82-12499

S

S WAVES

Shear waves in buildings subjects to seismic loading [ISSN-0208-5658] N82-12462

SAFETY

Space nuclear safety and fuels program N82-12921

SAFETY FACTORS

Guidance for implementing an environmental, safety and health assurance program. Volume 12: Model guidelines for line organization environmental, safety and health inspection and monitoring activities [DE81-030991] N82-12668

Guidance for implementing an environmental, safety and health assurance program. Volume 13: Model guidelines for line organization environmental, safety and health meetings [DE81-030980] N82-12669

Conspicuity of observation posts at the air weapon firing ranges on the Vliehors and the Noordvaarder [IZF-1979-33-E] N82-12774

SAGE SATELLITE
SAGE measurements of the stratospheric aerosol dispersion and loading from the Soufriere Volcano
[NASA-TP-1922] N82-12687
SALT BEDS
Calculations on seismic coupling of underground explosions in salt
[DE81-030633] N82-12706
SAMPLING
Method and apparatus for detecting coliform organisms
[NASA-CASE-ARC-11322-1] N82-12739
Development and analysis of a modified screening procedure to increase acceptable product
[AD-A104936] N82-12874
SANDS
Desert sand seas N82-12493
An investigation of sand and sandstone permeability degradation at elevated temperature and pressure
N82-12683
SANDSTONES
An investigation of sand and sandstone permeability degradation at elevated temperature and pressure
N82-12683
SATELLITE INSTRUMENTS
Ionospheric propagation correction modeling for satellite altimeters
[NASA-CR-156881] N82-12447
Study of hollow corner retroreflectors for use in a synchronous orbit
[NASA-CR-166750] N82-12931
SATELLITE NETWORKS
Combined report number 22. SATNET development and operation, Pluribus Satellite IMP development, remote site maintenance, internet development, mobile access terminal network, TCP for the HP3000, TCP-TAC, TCP for VAX-UNIX
[AD-A104931] N82-12313
SATELLITE PERTURBATION
Thruster-exhaust-plume-impingement disturbance torque of three-axis-stabilized satellite
[NAL-TR-670] N82-12100
SATELLITE POWER TRANSMISSION (TO EARTH)
Workshop on Microwave Power Transmission and Reception. Workshop paper summaries
[NASA-TM-84064] N82-12538
An active alignment scheme for the MPTS array
N82-12541
Ionospheric power beam studies N82-12542
Proposed experimental studies for assessing ionospheric perturbations on SPS uplink pilot beam signal N82-12543
Coherent multiple tone technique for ground based SPS phase control N82-12546
An interferometer-based phase control system
N82-12547
A sonic satellite power system microwave power transmission simulator N82-12548
SPS phase control studies N82-12549
SPS fiber optic link assessment N82-12550
SATELLITE SOLAR POWER STATIONS
System performance conclusions N82-12539
SPS large array simulation N82-12540
Performance analysis and simulation of the SPS reference phase control system N82-12544
Coherent multiple tone technique for ground based SPS phase control N82-12546
The adapting of the crossed-field directional amplifier to the requirements of the SPS N82-12554
SPS antenna element evaluation N82-12555
The Resonant Cavity Radiator (RCR) N82-12556
Evaluation of thick wall wave guide element
N82-12557
Method for precision forming of low-cost, thin-walled slotted waveguide arrays for the SPS N82-12558
Considerations for high accuracy radiation efficiency measurements for the Solar Power Satellite (SPS) subarrays N82-12559
The history of the development of the rectenna
N82-12560
Rectenna system design N82-12561
Rectenna session: Micro aspects N82-12562
A theoretical study of microwave beam absorption by a rectenna N82-12563
Rectenna array measurement results N82-12564
Session on solid state: Introduction N82-12565
Modified reference SPS with solid state transmitting antenna N82-12566
SPS solid state antenna power combiner
N82-12567
Solid-state retrodirective phased array concepts for microwave power transmission from Solar Power Satellite N82-12568
SATELLITE TRACKING
AE-5 end of mission tests report — Explorer 55 satellite
[NASA-TM-83845] N82-12099
Military geodesy and geospace science unit four
[AD-A105073] N82-12702
SATELLITE TRANSMISSION
An evaluation of the performance of 12 GHz low cost TVRO terminals in northwestern Ontario — ground terminals for ANIK B
[CRC-1345] N82-12299
Performance evaluation of the virtual subchannel concept for satellite link communication
[ENST-D-81002] N82-12324
SATURN SATELLITES
Orbit improvement of the satellites of the outer planets
[NASA-CR-164987] N82-13037
SCALE (CORROSION)
Scale prevention. Study on the crystallization of calcium sulfate and barium sulfate with and without inhibitors N82-12165
SCALE EFFECT
An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on model scale effects
[AD-A104905] N82-12392
On the computation of optimal designs for certain time series models with applications to optimal quantile selection for location or scale parameter estimation
[AD-A104935] N82-12875
SCALE MODELS
Simulation of the thermal behavior of an object and its nearby surroundings
[PHL-1980-08] N82-12863
SCALING LAWS
On finite word length effects of second order recursive digital filters N82-12334
Scaling laws for pulsed chain-reaction chemical lasers
[AD-A104752] N82-12436
SCANDIUM
Mechanical properties and hydrogen embrittlement of scandium
[DE81-030745] N82-12221
SCATTERING COEFFICIENTS
Multiple electromagnetic scattering from a cluster of spheres. Volume 1: Theory
[AD-A105453] N82-12310
SCATTERING CROSS SECTIONS
Interaction potentials between rare gas atoms and hologen atoms
[AD-A104836] N82-12899
Inclusive proton spectra and total reaction cross sections for proton-nucleus scattering at 800 MeV
[DE81-030505] N82-12906
Experimental demonstration of Feshbach resonances in atom-molecule scattering, with the help of measurements on the H2(pH2)-Kr and HD-Xe systems
[MPIS-14/1980] N82-12913
SCHEDULING
New scheduler for job processing in computer systems
[NAL-TR-659] N82-12795
SCHIST
Behavioral predictions of compacted embankments on rigid foundations — in the Republic of Gabon
N82-12271
SCHOTTKY DIODES
Investigation of solar cells based on Cu2 — with emphasis on junction fabrication
[DE81-030274] N82-12607
Effects of uniaxial stress on the Schottky-Barrier electroreflectance spectra of GaAs and GaP
N82-12959
SEA ICE
Visual observations of floating ice from Skylab
N82-12504
SEA ROUGHNESS
Visual observations of the ocean N82-12502
SEA STATES
Standardized wave and wind environments for NATO operational areas
[AD-A105414] N82-12725
SEALING
Compression stress relaxation testing for determining the performance of elastomeric fluid shells N82-12459
SEALS (STOPPERS)
Modified face seal for positive film stiffness
[NASA-CASE-LEW-12989-1] N82-12442
Study and development of face-contact, bellows mechanical seal for liquid hydrogen turbopump
[NAL-TR-653] N82-12443
SEAMOUNTS
Visual observations of the ocean N82-12502
SEARCH PROFILES
Abstract data types and data bases N82-13005
Defense Technical Information Center free text experiment: Technical report file
[AD-A105449] N82-13007
SEARCH RADAR
Moving target Detector/Airport Surveillance radar (ASR-7) field evaluation
[AD-A105196] N82-12303
Tracking procedures for FUCAS — phased array radar
[PHL-1980-45] N82-12329
SEAS
Global Tectonics: Some Geologic analyses of observations and photographs from Skylab
N82-12494
SEASAT SATELLITES
Boundary detection criteria for satellite altimeters
[NASA-CR-156880] N82-12734
SECONDARY COSMIC RAYS
On the nature of the cosmic ray positron spectrum
[NASA-TM-83834] N82-13041
SECONDARY FLOW
The coherent structure of turbulent mixing layers. 1: Similarity of the primary vortex strucuture. 2: Secondary streamwise vortex structure N82-12033
SECURITY
Evaluation of active and passive near-millimeter-wave radiometric imaging techniques for detection of concealed objects
[DE81-031936] N82-12316
SEDIMENT TRANSPORT
The stabilization of coal-oil mixtures N82-12237
Chemical and geochemical studies off the coast of Washington
[DE81-030319] N82-12513
Hydrogeochemical and stream sediment reconnaissance basic data for Wainwright Quadrangle, Alaska
[DE81-028670] N82-12528
Hydrogeochemical and stream sediment reconnaissance basic data for Point Lay Quadrangle, Alaska
[DE81-028669] N82-12529
SEDIMENTARY ROCKS
Remote sensing studies of some ironstone gravels and plinthite in Thailand N82-12491
The Arrinthrunga formation: Upper Cambrian epeiric carbonates in the Georgina Basin, central Australia
[BMR-BULL-211] N82-12686
SEDIMENTS
Hydrogeochemical and stream sediment reconnaissance basic data for Ruby Quadrangle, Alaska
[DE81-029982] N82-12512
Hydrogeochemical and stream sediment reconnaissance basic data for Teshekpuk Quadrangle, Alaska
[DE81-027408] N82-12531
Hydrocarbon composition of sediments, water, and fauna in selected areas of the Gulf of Mexico and Southern California marine environment N82-12732
SEISMIC ENERGY
Shear waves in buildings subjects to seismic loading
[ISSN-0208-5658] N82-12462
Calculations on seismic coupling of underground explosions in salt
[DE81-030633] N82-12706
SEISMOLOGY
Earthquakes in the United States, July - September 1979
[USGS-CIRC-836-C] N82-12690
Earthquakes in the United States, January - March 1979
[CIRC-836-A] N82-12691
Fundamental studies in geodynamics
[NASA-CR-164990] N82-12696

Synthesis of regional crust and upper-mantle structure from seismic and gravity data [NASA-CR-165001] N82-12996
SELECTION
The distribution of quadratic forms in normal variables with applications to the comparison of variable selection criteria N82-12872
SELECTIVE DISSEMINATION OF INFORMATION
China report: Science and technology, no. 133 [JPRS-79301] N82-12104
Information in society N82-12993
The security of computer systems N82-12997
SELECTIVITY
Silicon transport epitaxy — low temperature epitaxial process [BMFT-FB-T-80-165] N82-12980
SELENIDES
TDPAC study of the In2Se3 crystal structure [AD-A104729] N82-12974
SELF OSCILLATION
Self-sustained oscillations of a mixing layer. Edge system N82-12374
SEMANTICS
Semantics of inheritance and attributions in the description system Omega [AD-A104776] N82-12841
SEMICONDUCTOR DIODES
High-frequency high-voltage high-power DC-to-DC converters N82-12347
SEMICONDUCTOR LASERS
Excess noise in tunable diode lasers [NASA-TP-1935] N82-12431
SEMICONDUCTORS (MATERIALS)
Fundamentals of magnetic interactions: New approaches to theory and experiment [AD-A105003] N82-12887
Deep levels in Al sub x Ga sub 1 xAs:Fe single crystals [AD-A105233] N82-12970
TDPAC study of the In2Se3 crystal structure [AD-A104729] N82-12974
Research and development on new technologies for the preparation of III-V semiconductor materials and on methods for evaluation of the quality of these materials. Project Ga(AsP) expitaxial layers and substrates for them [BMFT-FB-T-81-020] N82-12982
SENSITIVITY
Gastrointestinal allergy in the experimental animal: The use of radioiodinated serum albumin in the assessment of new drugs [IAEA-R-2067-F] N82-12741
SENSORIMOTOR PERFORMANCE
Identification of the adaptive feedback of the human motor system using the response difference method N82-12754
SENTENCES
Effect of the orientation of the speaker's head and azimuth of a noise source on the speech reception threshold for sentences [IZF-1980-18] N82-12898
SEPARATED FLOW
Self-sustained oscillations of a mixing layer. Edge system N82-12374
Observations of the effects of boundary layer and nuclei on cavitation of axisymmetric bodies [AD-A104779] N82-12383
SEPARATION
Selective separation of coal feedstocks for conversion by magnetic separation techniques [DE81-026060] N82-12263
SEPARATORS
Separation via multi-column pH parametric pumping N82-12158
Laminar-flow-cyclone development program [DE81-001297] N82-12399
Galvanic high energy cells with molten salt electrolytes — electric vehicle propulsion [BMFT-FB-T-81-048] N82-12643
SERVICE LIFE
Study of the emission performance of high-power klystrons: SLAC XK-5 [DE81-030177] N82-12382
SERVICE MODULES
Modular hydro dam approach to the economic development of ultra low-head hydropower [DE81-027817] N82-12635
SERVOCONTROL
Control systems improvements in a precision coordinate measuring machine [DE82-000024] N82-12281
SERVOMECHANISMS
A simplified power factor controller with increased energy saving circuit [NASA-CASE-MFS-25323-1] N82-12349
Advanced electrofluidic servovalve development [AD-A105172] N82-12361
SET THEORY
How a digital computer can tell that a straight line is straight [AD-A105076] N82-12246
Optimal integer and fractional covers: A sharp bound on their ratio [AD-A104629] N82-12886
SEWAGE
Measurement procedure to determine organic compounds in water (combustion method) [BMFT-FB-T-81-014] N82-12206
SEWAGE TREATMENT
Interactive model to assess economics of anaerobic digestion of the farm [DE82-000452] N82-12620
SHALE OIL
Investigation of factors affecting the in-situ combustion retorting of oil shale [DE82-000482] N82-12200
Evaluation of shale oil as a utility gas-turbine fuel [DE81-904234] N82-12251
Meteorological and climatological investigation: Review of January - June 1980 investigative period [DE81-030740] N82-12731
Identification and toxicity of fractionated-shale-oil components [DE81-028460] N82-12766
SHAPE CONTROL
The dynamics and control of large flexible space structures [NASA-CR-164962] N82-12096
Test progress on the electrostatic membrane reflector [NASA-CR-165792] N82-12472
SHAPED CHARGES
Explosion experiments using cylindrical and conical charges [N-40-1871-0] N82-12239
SHEAR LAYERS
A two-dimensional study of the maximum power that can be obtained from a wind turbine in a wind shear layer [FFA-134] N82-12537
SHEAR STRESS
Strain and pore pressure behavior of fine grained soils subjected to cyclic shear loading N82-12272
SHELL THEORY
Application and description of the interacting Boson Model N82-12914
SHELTERS
Midway house-tightening project: A study of indoor air quality — concentrations of radon formaldehyde, and nitrogen dioxide [DE81-030886] N82-12277
SHIPS
Estimation of bias errors in angle-of-arrival measurements using platform motion [AD-A104742] N82-12309
SHOCK ABSORBERS
HAWK launcher shock absorber (Part number 11567877) [AD-A105384] N82-12102
SHOCK LAYERS
An experimental study of massive blowing from a nosetip during Jovian entry [NASA-CR-165756] N82-12386
SHOCK WAVE INTERACTION
The response of two fluid-coupled plates to an incident pressure pulse [AD-A104801] N82-12475
SHOCK WAVES
SAGE measurements of the stratospheric aerosol dispersion and loading from the Soufriere Volcano [NASA-TP-1922] N82-12687
SIDESLIP
Wind-tunnel investigation of the side-force of rectangular winglets on the tip of a rectangular wing [NAL-TR-669] N82-12037
Effects of aerodynamic coupling on the dynamics of roll aircraft N82-12070
SIGNAL DETECTION
Detection of laser radiation by means of forward scattering in the atmosphere [PHL-1979-51] N82-12327
SIGNAL DISTORTION
Radar imaging from a distorted array [AD-A104803] N82-12308
SIGNAL ENCODING
Bandwidth constrained signal design for digital communication over Rayleigh Fading channels and Partial Band interference channels N82-12299
SIGNAL FADING
Reduction of multipath fading in radio relay links based on the principle of optimum beam scan [REPT-455-TBR-71] N82-12320
SIGNAL PROCESSING
Payload/orbiter signal-processing and data-handling system evaluation [NASA-CR-161007] N82-12107
Efficient structure, and algorithms for digital signal processing N82-12296
Optical processing for adaptive phased array radar [AD-A105124] N82-12305
Effect of reference set selection on speaker dependent speech recognition: Frame compression in isolated word recognition [AD-A104794] N82-12307
Radar imaging from a distorted array [AD-A104803] N82-12308
Implementation of SAW chirp transform and SAW convolvers in spread spectrum communication systems N82-12341
Nonlinear real-time optical signal processing [AD-A105186] N82-12796
SIGNAL TO NOISE RATIOS
Excess noise in tunable diode lasers [NASA-TP-1935] N82-12431
SIGNAL TRANSMISSION
Bandwidth constrained signal design for digital communication over Rayleigh Fading channels and Partial Band interference channels N82-12299
Characteristics of a code division multiplex configuration with direct modulation [REPT-442-TBR-61] N82-12318
SIGNATURES
Simulation of the thermal behavior of an object and its nearby surroundings [PHL-1980-08] N82-12863
SILICON
Silicon quality: A consideration for VHSI circuit development [AD-A105198] N82-12355
Piezoelectric ZnS film on silicon [AD-A105161] N82-12359
Study of Al/Si interface by photoemission, Auger electron spectroscopies [DESY-SR-80/08] N82-12979
Silicon transport epitaxy — low temperature epitaxial process [BMFT-FB-T-80-165] N82-12980
SILICON CARBIDES
Blue light emitting luminescent diodes of silicon carbide — fabrication [BMFT-FB-T-81-010] N82-12368
SILICON COMPOUNDS
Analysis of the temperature dependence of resistivity in N-type silicon [AD-A105192] N82-12978
SILICON DIOXIDE
Microstructure formation in the Au-SiO2 cermet during annealing N82-12227
SILICON NITRIDES
Strength evaluation test of hot-pressed silicon nitride at room temperature [NAL-TR-676] N82-12136
SILVER
Silver films for solid state bonding [DE82-000414] N82-12223
SIMULATION
Simulation of the flow during stamping: Characteristics and application of modeling clay used for simulation of material flow in a forge [CETIM-1.3K.28.2] N82-12286
SIMULATORS
A sonic satellite power system microwave power transmission simulator N82-12546
A statistical evaluation of OHMSETT testing [PB81-226126] N82-12679
SCALD 2 logic simulator [DE81-030679] N82-12827

SIMULTANEOUS EQUATIONS

Solution methods on algebra problems with simultaneous equations
[AD-A105178] N82-12852

SINE WAVES

The response and the lift force analysis of a cylinder oscillating in still water N82-12464

SINGLE CRYSTALS

Fracture of magnesium aluminate spinel N82-12213

Low-loss fiber waveguides
[AD-A104943] N82-12358

A study of the phase transitions in benzil by Raman and Brillouin scattering techniques N82-12962

Deep levels in Al sub x Ga sub 1 xAs:Fe single crystals
[AD-A105233] N82-12970

Elastic domain wall waves in ferroelectric ceramics and single crystals
[AD-A105110] N82-12971

SINTERING

Behavior and morphology of palladium on alumina model catalysts in hydrogen and oxygen N82-12153

SITE SELECTION

Geothermal reservoir assessment: Northern basin and range province Stillwater prospect, Churchill County, Nevada
[DE82-000529] N82-12516

On the geodetic stability of the Goddard Optical Research Facility
[NASA-TM-82175] N82-12692

Environmental data for sites in the National Solar Data Network
[DE82-000071] N82-12707

SKIN FRICTION

Some aspects of skin friction of piles in clay under cyclic loading
[PB81-226730] N82-12266

SKY BRIGHTNESS

A study of galactic light, extragalactic light, and galactic structure using Pioneer 10 observations of background starlight N82-13040

SKYLAB 4

Skylab explores the Earth
[NASA-SP-380] N82-12492

SLAGS

Liquidus temperatures of commercial ESR slags
[AD-A105266] N82-12217

SLENDER BODIES

A source-doublet approach to modeling triple ejector rack store configurations and force calculations
[AD-A105427] N82-12045

SLENDER WINGS

Low-speed measurements of the static pressure distribution and overall forces on a cambered and a symmetric mild gothic wing of aspect ratio 1.4
[RAE-TR-80066] N82-12027

A vortex-filament and core model for wings with edge vortex separation
[NASA-CR-164980] N82-12039

SLIDING

Control systems improvements in a precision coordinate measuring machine
[DE82-000024] N82-12281

SLIDING FRICTION

Structure: Property relationships in gold based sliding electrical contact materials N82-12210

SLOT ANTENNAS

SPS antenna element evaluation N82-12555

Evaluation of thick wall wave guide element N82-12557

Method for precision forming of low-cost, thin-walled slotted waveguide arrays for the SPS N82-12558

SLOTTED WIND TUNNELS

A look inside the Langley 16-foot transonic tunnel: User's guide
[NASA-TM-83186] N82-12085

SLUDGE

Energy recovery from municipal solid waste and sewage sludge using multi-solid fluidized bed combustion technology
[DE82-001142] N82-12596

Kinetics of wet oxidation of biological sludges from coal-conversion wastewater treatment
[DE82-000525] N82-12674

SLURRIES

Solvent-Refined Coal (SRC) process
[DE81-031937] N82-12197

Measurement of thermal conductivities in coal fluids
[DE82-000523] N82-12400

SMOKE

Quantitative analysis of atmospheric pollution phenomena N82-12505

SNOW

Progress in radar snow research — Brookings, South Dakota
[NASA-CR-166709] N82-12510

SNOW COVER

Snow-mapping experiment N82-12498

Effects of volcanism on the glaciers of Mount St. Helens
[USGS-CIRC-850-D] N82-12689

SOCIAL FACTORS

Background and purpose of the study N82-12991

Information in society N82-12993

SOCIOLOGY

Society's dependence on information systems N82-12999

SOFTENING

Experimental investigation of the influence of high power ultrasound on metals N82-12211

SOIL EROSION

Report on Skylab 4 African drought and arid land experiment N82-12501

Technology assessment of solar energy systems: Potential soil erosion effects of harvesting crop residues for energy production
[DE82-000149] N82-12606

SOIL MECHANICS

Finite element analysis of soil-sheet pile interaction N82-12268

An improved model for soil-structure interaction analysis N82-12269

Behavioral predictions of compacted embankments on rigid foundations — in the Republic of Gabon N82-12271

Strain and pore pressure behavior of fine grained soils subjected to cyclic shear loading N82-12272

A one-dimensional plane wave propagation code for layered rate-dependent hysteretic materials
[AD-A105241] N82-12274

Modelling of soil-structure interaction by finite and infinite elements
[PB81-229270] N82-12267

SOIL MOISTURE

A two-layer ground hydrology model interactive with an atmospheric circulation model N82-12486

SOIL SCIENCE

Soil stabilization by chemical additives — phosphoric acid and lime N82-12270

SOILS

Remote sensing studies of some ironstone gravels and plinthite in Thailand N82-12491

SOLAR ARRAYS

System performance conclusions N82-12539

SPS large array simulation N82-12540

An active alignment scheme for the MPTS array N82-12541

Design and breadboard evaluation of the SPS reference phase control system concept N82-12545

Ionospheric effects in active retrodirective array and mitigating system design N82-12551

SOLAR CELLS

Thruster-exhaust-plume-impingement disturbance torque of three-axis-stabilized satellite
[NAL-TR-670] N82-12100

Silicon quality: A consideration for VHSI circuit development
[AD-A105196] N82-12355

Testing of solar cell covers and encapsulants conducted in a simulated space environment
[NASA-CR-165475] N82-12571

Intermediate photovoltaic system application experiment operational performance: Executive summary. Volume 1: For Newman Power Station, El Paso, Texas
[DE81-031934] N82-12602

Investigation of solar cells based on Cu2 — with emphasis on junction fabrication
[DE81-030274] N82-12607

Photovoltaic mechanisms in polycrystalline thin film silicon solar cells
[DE81-030370] N82-12608

SOLAR COLLECTORS

Guidebook for solar process-heat applications
[DE81-027977] N82-12596

Cost goals for a residential photovoltaic/thermal liquid collector system set in three northern locations
[DE81-029700] N82-12610

Near-term improvements in parabolic troughs: An economic and performance assessment
[DE82-001158] N82-12615

Improvement of thermal efficiency of flat plate solar collectors
[BMFT-FB-T-80-194] N82-12642

Environmental data for sites in the National Solar Data Network
[DE82-000071] N82-12707

SOLAR COOLING

Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 1: Energy-conserving design for residential structures
[DE82-900206] N82-12278

Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 3: Customer load management systems
[DE82-900208] N82-12280

United States Department of Energy thermal storage program
[DE81-030263] N82-12585

Optimization of solar heating and cooling systems
[NP-1903997] N82-12599

SOLAR ENERGY

Interior design for passive solar homes
[DE81-027939] N82-12282

Comparison of residential window distributions and effects of mass and insulation
[DE81-027938] N82-12283

Status of solar energy research and development in Australia
[NP-1903916] N82-12611

Solar Energy Information Data Bank (SEIDB) program, FY 1981
[DE81-030054] N82-12612

Solar thermal central receivers for industrial process heat generation: User views and recommendations for commercialization
[DE81-029611] N82-12618

Flexibilities in passive design: Examining some limiting solar myths
[DE81-028401] N82-12623

Seasonal performance factors for active solar systems and heat-pump systems
[DE81-028569] N82-12625

Solar explosion
[DE81-026086] N82-12628

Passive-solar-retrofit study for the United States Navy
[DE81-026921] N82-12629

Department of Energy Solar Central Receiver Semiannual Meeting
[SAND-80-8049] N82-12632

Energy technologies and the environment. Environmental information handbook
[DE81-029809] N82-12660

SOLAR ENERGY CONVERSION

Passive solar technical planning study
[EPRI-EM-1591] N82-12578

Intermediate photovoltaic system application experiment operational performance: Executive summary. Volume 1: For Newman Power Station, El Paso, Texas
[DE81-031934] N82-12602

Basis for research proposals concerning (industrial) solar energy production processes derived from biological principles N82-12640

Study of radiatively sustained cesium plasmas for solar energy conversion
[NASA-CR-166265] N82-13039

SOLAR FLUX

Environmental data for sites in the National Solar Data Network
[DE82-000071] N82-12707

SOLAR FLUX DENSITY

Ionospheric propagation correction modeling for satellite altimeters
[NASA-CR-156861] N82-12447

SOLAR GENERATORS

Passive solar technical planning study
[EPRI-EM-1591] N82-12578

Comparative economics of solar thermal central receivers
[DE81-029623] N82-12601

Photovoltaic market analysis program: Background, model development, applications and extensions
[DE81-029711] N82-12609

Economic assessment of advanced central-receiver solar-thermal power systems: Executive summary
[DOE/SF-10601/0] N82-12624

Basis for research proposals concerning (industrial) solar energy production processes derived from biological principles N82-12640

West Europe report: Science and technology, no. 72 — composite materials and energy technology
[JPRS-78676] N82-12645

Solar project at Almeria nears completion
N82-12647

SOLAR HEATING

Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 1: Energy-conserving design for residential structures
[DE82-900206] N82-12278

Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 2: Domestic hot water systems
[DE82-900207] N82-12279

Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 3: Customer load management systems
[DE82-900208] N82-12280

United States Department of Energy thermal storage program
[DE81-030263] N82-12585

Guidebook for solar process-heat applications
[DE81-027977] N82-12598

Optimization of solar heating and cooling systems
[NP-1903997] N82-12599

Summertime results from the class B passive-solar performance-monitoring program
[DE81-025471] N82-12627

Economic implications of passive-solar retrofit for single-family residences in Albuquerque, New Mexico: A case study
[DE81-028402] N82-12630

Passive cooling and heating program at Oak Ridge National Laboratory for FY-1981
[DE81-028573] N82-12631

The properties of solar and heat pump heating systems of small houses and additional heat sources
[VTT-56] N82-12644

SOLAR HOUSES

Interior design for passive solar homes
[DE81-027939] N82-12282

Vocational-Technical Instructors Passive-Solar Training Workshop
[DE81-030055] N82-12622

Flexibilities in passive design: Examining some limiting solar myths
[DE81-028401] N82-12623

Performance analysis of 11 Denver Metro passive homes
[DE81-025473] N82-12626

Summertime results from the class B passive-solar performance-monitoring program
[DE81-025471] N82-12627

The properties of solar and heat pump heating systems of small houses and additional heat sources
[VTT-56] N82-12644

SOLAR PONDS (HEAT STORAGE)

Comparative economic performance of selected passive solar heating and cooling technologies
[DE81-030220] N82-12600

SOLAR RADIATION

Use of Sandia's Central Receiver Test Facility as a high-intensity heat source for testing missile nose-cone (radome) radar systems
[DE82-000968] N82-12086

The window and its heat balance considering solar radiation and additional insulation measures
[BMFT-FB-T-80-070] N82-12402

SOLAR REFLECTORS

User's guide to HELIOS: A computer program for modeling the optical behavior of reflecting solar concentrators. Part 1: Introduction and code input
[DE81-031920] N82-12616

SOLAR THERMAL PROPULSION

Economic assessment of advanced central-receiver solar-thermal power systems: Executive summary
[DOE/SF-10601/0] N82-12624

SOLAR X-RAYS

Data reduction and analysis for the graphite crystal X-ray spectrometer and polarimeter experiment flown aboard OSO-8 spacecraft
[NASA-CR-166749] N82-13030

SOLDERED JOINTS

The stability and soldering void effect of large superconductor N82-12340

SOLID PHASES

Solid-solid reactions in coal conversion processes
N82-12238

Geochemical modeling: A review
[DE81-028989] N82-12708

SOLID PROPELLANT COMBUSTION

Combustion mechanisms of solid propellants
[AD-A105163] N82-12244

SOLID PROPELLANTS

Prefracture behavior of solid propellants
[AD-A104746] N82-12247

SOLID SOLUTIONS

Acoustic emission of plastic flow in metals and alloys N82-12209

SOLID STATE DEVICES

Session on solid state: Introduction N82-12565

Modified reference SPS with solid state transmitting antenna N82-12566

SPS solid state antenna power combiner
N82-12567

Solid-state retrodirective phased array concepts for microwave power transmission from Solar Power Satellite N82-12568

Voltage losses and reconditioning of NiCd cells: Behavior during cycling
[AD-A105418] N82-12575

SOLID SUSPENSIONS

Calibration of a turbidity meter for making estimates of total suspended solids concentrations and beam attenuation coefficients in field experiments
[NASA-TM-81873] N82-12655

SOLID WASTES

Energy recovery from municipal solid waste and sewage sludge using multi-solid fluidized bed combustion technology
[DE82-001142] N82-12596

Conversion of municipal solid waste to energy, Jacksonville, Florida, phase 1
[DE82-000806] N82-12613

Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic-fuels production
[DE81-030671] N82-12673

Nuclear waste incineration technology status
[DE81-025751] N82-12926

SOLID-SOLID INTERFACES

Study of Al/Si interface by photoemission, Auger electron spectroscopies
[DESY-SR-80/06] N82-12979

SOLIDIFICATION

Gravitational influence on binary alloy melt equilibria and eutectic solidification N82-12215

Process for the denitrification of high-level radioactive liquid wastes
[DE81-026675] N82-12925

Transient and diffusion analysis of Hg Cd Te
[NASA-CR-161524] N82-12964

SOLIDIFIED GASES

Nuclear magnetic resonance studies of solid krypton N82-12961

SOLITARY WAVES

Interaction of ion-acoustic solitons in multi-dimensional space, 2
[IPPJ-535] N82-12941

SOLUBILITY

Comments on the hydrogen solubility data for liquid lead, lithium and lithium-lead alloys and review of a tritium-solubility model for lithium-lead alloys — tritium breeding blanket
[DE81-030628] N82-12220

SOLUTES

Transient and diffusion analysis of Hg Cd Te
[NASA-CR-161524] N82-12964

SOLVENT EXTRACTION

Analysis for organic pigments using solution spectrophotometry N82-12150

Solvent extraction studies using high-molecular-weight amines
[DE81-030061] N82-12191

Solvent-Refined Coal (SRC) process
[DE81-031937] N82-12197

Supercritical multicomponent solvent coal extraction
[NASA-CASE-NPO-15767-1] N82-12241

Treatment of biomass-gasification wastewaters using liquid-liquid extraction
[DE82-000711] N82-12662

SOLVENTS

Dehydrogenation/hydrogenation reactions in hydroaromatic systems
[DE81-027667] N82-12201

SONAR

How to display digital SONAR signals. Some primary threshold measurements
[IZF-1979-16] N82-12773

SOOT

Chemistry of combustion of fuel-water mixtures
[AD-A105401] N82-12178

SOS (SEMICONDUCTORS)

Silicon-on-sapphire medium power MESFET
[AD-A105378] N82-12352

SOUND GENERATORS

Effect of the orientation of the speaker's head and azimuth of a noise source on the speech reception threshold for sentences
[IZF-1980-18] N82-12896

SOUND LOCALIZATION

How to display digital SONAR signals. Some primary threshold measurements
[IZF-1979-16] N82-12773

SOUND PROPAGATION

Numerical techniques in linear duct acoustics, 1980-81 update
[NASA-TM-82730] N82-12890

Verification of an acoustic transmission matrix analysis of sound propagation in a variable area duct without flow
[NASA-TM-82741] N82-12891

SOUND TRANSDUCERS

Acoustic system for material transport
[NASA-CASE-NPO-15453-1] N82-12889

SOUND TRANSMISSION

Thresholds of hearing by air conduction and by bone conduction under different masking conditions
[NPL-AC-100] N82-12768

Verification of an acoustic transmission matrix analysis of sound propagation in a variable area duct without flow
[NASA-TM-82741] N82-12891

Measurement of sound absorption of screens
[SP-RAPP-1979-31] N82-12895

SOUND WAVES

S-Band Shallow Bulk Acoustic Wave (SBAW) microwave source
[NASA-CR-166744] N82-12344

Some aspects of ultrasonic nonspecular reflection
[AD-A105225] N82-12893

SOUNDING ROCKETS

Project PORCUPINE: Magnetometer experiment
[BMFT-FB-W-80-028] N82-12709

SOUTH DAKOTA

Progress in radar snow research — Brookings, South Dakota
[NASA-CR-166709] N82-12510

Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] N82-12604

SOUTHERN CALIFORNIA

Hydrocarbon composition of sediments, water, and fauna in selected areas of the Gulf of Mexico and Southern California marine environment N82-12732

SPACE COMMUNICATION

Handbook for the estimation of microwave propagation effects: Link calculations for earth-space paths (path loss and noise estimation)
[NASA-CR-165002] N82-12301

SPACE COOLING (BUILDINGS)

Passive solar technical planning study
[EPRI-EM-1591] N82-12578

United States Department of Energy thermal storage program
[DE81-030263] N82-12585

Optimization of solar heating and cooling systems
[NP-1903997] N82-12599

Comparative economic performance of selected passive solar heating and cooling technologies
[DE81-030220] N82-12600

Passive cooling and heating program at Oak Ridge National Laboratory for FY-1981
[DE81-028573] N82-12631

SPACE ERECTABLE STRUCTURES

Shuttle considerations for the design of large space structures
[NASA-CR-160861] N82-12091

Space Construction Experiment Definition Study (SCEDS), part 1. Volume 1: Executive summary
[NASA-CR-167458] N82-12094

Space Construction Experiment Definition Study (SCEDS), part 1. Volume 2: Study results
[NASA-CR-167432] N82-12095

Critical requirements for the design of large space structures
[NASA-CR-3484] N82-12131

SPACE HEATING (BUILDINGS)

Practical demonstration of heat pumps for utilization of animal-generated heat
[BMFT-FB-T-80-100] N82-12403

Passive solar technical planning study
[EPRI-EM-1591] N82-12578

United States Department of Energy thermal storage program
[DE81-030263] N82-12585

Optimization of solar heating and cooling systems
[NP-1903997] N82-12599

Comparative economic performance of selected passive solar heating and cooling technologies
[DE81-030220] N82-12600

Technology assessment of solar energy systems: Residential use of fuelwood in the Pacific Northwest
[DE82-000046] N82-12603

Summertime results from the class B passive-solar performance-monitoring program
[DE81-025471] N82-12627

Passive-solar-retrofit study for the United States Navy
[DE81-028921] N82-12629

Passive cooling and heating program at Oak Ridge National Laboratory for FY-1981
[DE81-026573] N82-12631

SPACE MAINTENANCE

Study to define an approach for developing a computer-based system capable of automatic, unattended assembly/disassembly of spacecraft, phase 1
[NASA-CR-166740] N82-12092

Space Construction Experiment Definition Study (SCEDS), part 1. Volume 2: Study results
[NASA-CR-167432] N82-12095

Satellite maintenance in orbit N82-12096

SPACE PERCEPTION

Cybernetics and car driving: Perspective perception and the output vector of the system to be controlled
[IZF-1980-19] N82-12778

SPACE PLASMAS

Collective effects in diffuse ambiplasma
N82-12963

SPACE PROCESSING

Susceptibility of materials processing experiments to low-level accelerations N82-12118

Convection in fluids at reduced gravity
N82-12119

SPACE SHUTTLE ORBITERS

Space Construction Experiment Definition Study (SCEDS), part 1. Volume 1: Executive summary
[NASA-CR-167458] N82-12094

Space Construction Experiment Definition Study (SCEDS), part 1. Volume 2: Study results
[NASA-CR-167432] N82-12095

Advanced Shuttle Simulation Turbulence Tapes (SSTT) users guide
[NASA-CR-161890] N82-12106

Payload/orbiter signal-processing and data-handling system evaluation
[NASA-CR-161007] N82-12107

Spacecraft dynamic environments N82-12122

Design of the space shuttle digital autopilot and resulting dynamic environment N82-12126

Elastic body dynamics N82-12128

Crew activities in space N82-12129

A tile-gap flow model for use in aerodynamic loads assessment of space shuttle thermal protection system: Parallel gap faces
[NASA-TM-83151] N82-12387

Use of an engineering data management system in the analysis of space shuttle orbiter tiles
[NASA-TM-83215] N82-12815

SPACE SHUTTLE PAYLOADS

Shuttle considerations for the design of large space structures
[NASA-CR-160861] N82-12091

Space Construction Experiment Definition Study (SCEDS), part 1. Volume 1: Executive summary
[NASA-CR-167458] N82-12094

Payload/orbiter signal-processing and data-handling system evaluation
[NASA-CR-161007] N82-12107

SPACE SHUTTLES

Hardware survey for the avionics test bed
[NASA-CR-161072] N82-12796

SPACE TRANSPORTATION SYSTEM 1 FLIGHT

Passive Optical Sample Assembly (POSA)
[NASA-TM-82446] N82-12656

SPACEBORNE ASTRONOMY

Study on a refined image processing system for space astronomy
[ESA-CR(P)-1458] N82-13017

SPACEBORNE EXPERIMENTS

PC-402 Pioneer Venus orbiter spacecraft mission operational characteristics document
[NASA-CR-166260] N82-12090

Analysis of SPAR 8 single-axis levitation experiment
[NASA-TM-82447] N82-12093

Spacecraft Dynamics as Related to Laboratory Experiments in Space --- conference

SPACECRAFT PROPULSION

PC-403: Pioneer Venus multiprobe spacecraft mission operational characteristics document, volume 1
[NASA-CR-166261-VOL-1] N82-12087

SPACECRAFT STABILITY

Thruster-exhaust-plume-impingement disturbance torque of three-axis-stabilized satellite
[NAL-TR-670] N82-12100

SPACECREWS

Crew activities in space N82-12129

Skylab water balance analysis
[NASA-CR-167481] N82-12753

SPACELAB

Dynamics of superfluid helium in zero gravity --- Spacelab 2 investigation N82-12111

Geophysical fluid dynamics N82-12112

Crew activities in space N82-12129

SPACELAB PAYLOADS
Position and hold mount. Demonstration model — Spacelab experiments
[ESA-CR(P)-1460] N82-12108

SPACETENNAS
SPS large array simulation N82-12540

SPAIN
Solar project at Almeria nears completion N82-12647

SPECIFIC HEAT
Quasi-stationary approximation for the Stefan problem with a convective boundary condition
[DE81-030372] N82-12395
Analytical expressions for specific heats and isentropic exponents of high-temperature gases with their applications
[NAL-TR-671] N82-12984

SPECIMEN GEOMETRY
Friction and wear behavior of Ti-6Al-4V and a Ni base alloy (Hastelloy C-276) N82-12439

SPECTRAL LINE WIDTH
Using spectral line profiles as a diagnostic of the plasma electron density
[DE81-030313] N82-12952
Radar investigation of asteroids
[NASA-CR-164997] N82-13036

SPECTRAL REFLECTANCE
Effects of uniaxial stress on the Schottky-Barrier electroreflectance spectra of GaAs and GaP N82-12959

SPECTROPHOTOMETRY
Analysis for organic pigments using solution spectrophotometry N82-12150

SPECTROSCOPIC ANALYSIS
Laser excited Shpol'skii spectroscopy for the selective excitation and determination of polynuclear aromatic hydrocarbons N82-12151
Determination and analysis of jet and missile fuel deposits
[AD-A105456] N82-12248

SPECTROSCOPY
Data reduction and analysis for the graphite crystal X-ray spectrometer and polarimeter experiment flown aboard OSO-8 spacecraft
[NASA-CR-166749] N82-13030

SPECTRUM ANALYSIS
Analysis for organic pigments using solution spectrophotometry N82-12150
Autoregressive spectral estimation, log spectral smoothing and entropy
[AD-A104940] N82-12842
Radiographic applications of spatial frequency multiplexing
[NASA-CR-166748] N82-12930

SPEECH
New approach to speech digitization combining time-domain harmonic scaling and adaptive residual coding
[AD-A105383] N82-12311

SPEECH BASEBAND COMPRESSION
Effect of reference set selection on speaker dependent speech recognition: Frame compression in isolated word recognition
[AD-A104794] N82-12307

SPEECH RECOGNITION
Comparative study of nonlinear time warping techniques in isolated word speech recognition systems
[AD-A104865] N82-12306
Effect of reference set selection on speaker dependent speech recognition: Frame compression in isolated word recognition
[AD-A104794] N82-12307
Automatic recognition of cooperative speakers
[BMFT-FB-DV-80-009] N82-12319
Phonematic recognition by linear prediction: Experiment
[ENST-C-81001] N82-12323
Minimizing computational cost for dynamic programming algorithms
[AD-A104792] N82-12818

SPENT FUELS
Is spent fuel or waste from reprocessed spent fuel simpler to dispose of?
[EMD-81-78] N82-12917
Survey of matrix materials for solidified radioactive high-level waste
[DE82-000708] N82-12922

SPHERICAL CAPS
Spherical models: Basic states and stability N82-12720

SPHERICAL COORDINATES
Global isostatic geoid anomalies for plate and boundary layer models of the lithosphere
[NASA-CR-164985] N82-12695
Overview N82-12716
The AGCE apparatus N82-12717

SPHERICAL WAVES
Interaction of ion-acoustic solitons in multi-dimensional space, 2
[IPPJ-535] N82-12941

SPIN DYNAMICS
Model verification studies using accurate measurements of spin up N82-12722

SPIN TESTS
AE-5 end of mission tests report — Explorer 55 satellite
[NASA-TM-83845] N82-12099

SPINEL
Fracture of magnesium aluminate spinel N82-12213

SPLICING
The behavior and strength of lapped splices in reinforced concrete beams subjected to cyclic loading N82-12470

SPREAD SPECTRUM TRANSMISSION
Implementation of SAW chirp transform and SAW convolvers in spread spectrum communication systems N82-12341

SPREADING
Bibliographical study of nondestructive testing applicable to bonding
[CETIM-1.3N.20.2-PT-1] N82-12461

STABILITY DERIVATIVES
Evaluation and wind tunnel tests of the 4,000 lb (normal-force) pitch/yaw and roll dynamic stability balance systems for measuring direct, cross, and cross-coupling derivatives
[AD-A105122] N82-12047
Research developing closed loop roll control for magnetic balance systems
[NASA-CR-164969] N82-12084

STABILIZATION
The stabilization of coal-oil mixtures N82-12237
Soil stabilization by chemical additives — phosphoric acid and lime N82-12270
Stabilization of Rayleigh-Taylor instability due to the spontaneous magnetic field in laser produced plasma
[IPPJ-537] N82-12942

STAINLESS STEELS
Fracture mechanisms of sensitized stainless steels in sulfur-containing environments
[DE81-026052] N82-12482

STAMPING
Simulation of the flow during stamping: Characteristics and application of modeling clay used for simulation of material flow in a forge
[CETIM-1.3K.26.2] N82-12286
Lubrication during drawing: Bibliographical analysis and results, volume 1 — lubricant tests for a metal forming process
[CETIM-13-Y-152-VOL-1] N82-12456

STANDARD DEVIATION
Confidence interval estimation and tests for temporary outmigration in tag-recapture studies N82-12873

STANDARDS
Voltage test facility for defence standard 61-5
[NGTE-M-80112(L)] N82-12370
The GKS reviewing process — computer graphics and the graphical kernel system (GKS)
[MC-IW-164/81] N82-12831

STANDING WAVES
Verification of an acoustic transmission matrix analysis of sound propagation in a variable area duct without flow
[NASA-TM-82741] N82-12891

STATE VECTORS
Cybernetics and car driving: Perspective perception and the output vector of the system to be controlled
[IZF-1980-19] N82-12778

STATIC AERODYNAMIC CHARACTERISTICS
Low-speed measurements of the static pressure distribution and overall forces on a cambered and a symmetric mild gothic wing of aspect ratio 1.4
[RAE-TR-80066] N82-12027

STATIC LOADS
Properties of confined concrete subjected to static and dynamic loads N82-12468
A critical void growth failure criterion developed for dynamic and static loading conditions N82-12469

STATISTICAL ANALYSIS
National interim energy-consumption survey: Exploring the variability in energy consumption
[DE81-029910] N82-12589
A statistical evaluation of OHMSETT testing
[PB81-226128] N82-12679
A statistical approach to fuzzy data analysis N82-12864
Error propagation in the gravity model N82-12869

STATISTICAL DISTRIBUTIONS
Log odds ratio estimation in a grouped population N82-12865
Space-time clustering analysis N82-12866
Discrimination rules based on marginal distributions N82-12867
A quantile function approach to the k-sample quantile regression problem N82-12870
The distribution of quadratic forms in normal variables with applications to the comparison of variable selection criteria N82-12872
Confidence interval estimation and tests for temporary outmigration in tag-recapture studies N82-12873
Development and analysis of a modified screening procedure to increase acceptable product
[AD-A104936] N82-12874
Variances for adaptive trimmed means
[AD-A104913] N82-12876

STEADY FLOW
The problem of axially symmetric flow of ideal rigid-plastic Huber-Mises medium without any specific hypotheses
[ISSN-0208-5658] N82-12463

STEAM TURBINES
Steam turbine blades: Considerations in design and a survey of blade failures
[DE81-904249] N82-12450

STEEL STRUCTURES
Mechanical properties of a 4142 steel pressure vessel for auxiliary closures
[DE81-030983] N82-12480

STEELS
Liquidus temperatures of commercial ESR slags
[AD-A105268] N82-12217
Working strength of notched specimens in steel Ck45 and steel 42 Cr Mo4
[LBF-FB-155(1980)] N82-12483

STEERING
Levels of steering control: Reproduction of steering wheel movements
[IZF-1980-16] N82-12777

STEFAN-BOLTZMANN LAW
Quasi-stationary approximation for the Stefan problem with a convective boundary condition
[DE81-030372] N82-12395

STELLAR CORONAS
X-ray observations of stellar coronae N82-13038

STELLAR LUMINOSITY
X-ray observations of stellar coronae N82-13038
A study of galactic light, extragalactic light, and galactic structure using Pioneer 10 observations of background starlight N82-13040

STELLAR SPECTRA
Data reduction and analysis for the graphite crystal X-ray spectrometer and polarimeter experiment flown aboard OSO-8 spacecraft
[NASA-CR-166749] N82-13030
X-ray observations of stellar coronae N82-13038

STELLARATORS
Plasma research laboratory report, 1979
[INIS-MF-6067] N82-12955

STEP FUNCTIONS
A special class of multistep Runge-Kutta methods with extended real stability interval
[MC-NW-106/81] N82-12860

STIFFNESS
Modified face seal for positive film stiffness
[NASA-CASE-LEW-12989-1] N82-12442

STIFFNESS MATRIX
Numerical methods for singularly perturbed differential equations with applications
[AD-A105366] N82-12851

STIRLING CYCLE
Test results and facility description for a 40-kilowatt stirling engine
[NASA-TM-82620] N82-13013
STOCHASTIC PROCESSES
The queueing delay problem in multiple access schemes N82-12636
Optimal adaptive stochastic control of linear dynamical systems with multiplicative and additive noise N82-12866
STOKES FLOW
A tile-gap flow model for use in aerodynamic loads assessment of space shuttle thermal protection system: Parallel gap faces
[NASA-TM-83151] N82-12387
STOKES LAW (FLUID MECHANICS)
The effect of a translating high aspect ratio particle in a plane slider bearing N82-12440
STORAGE BATTERIES
Galvanic high energy cells with molten salt electrolytes — electric vehicle propulsion
[BMFT-FB-T-81-048] N82-12643
STORAGE RINGS (PARTICLE ACCELERATORS)
Axial translation of field-reversing relativistic electron rings N82-12915
STRAIN ENERGY METHODS
Shear waves in buildings subjects to seismic loading
[ISSN-0208-5658] N82-12462
Three-dimensional stress distribution in arteries: Radial compression experiments of arterial wall; stress concentration in lung near a cylindrical cavity; finite element analysis of pleural surface pressure distribution in dog's lung during electrophrenic stimulation N82-12750
STRAPDOWN INERTIAL GUIDANCE
Study on strapdown inertial navigation redundant sensor system
[NAL-TR-660] N82-12058
STRATIFIED FLOW
A study of time evolution of continuous vortex loops in a homogeneous or stratified fluid N82-12381
STRATOSPHERE
Cryogenic deposition, desorption, and reaction studies of stratospherically relevant species N82-12161
SAGE measurements of the stratospheric aerosol dispersion and loading from the Soufriere Volcano
[NASA-TP-1922] N82-12687
Morphology of stratospheric planetary waves
[AD-A105006] N82-12704
Reduction of photosynthetically active radiation under extreme stratospheric aerosol loads
[DE81-030506] N82-12705
STREAM FUNCTIONS (FLUIDS)
Prediction of the incompressible flow over a rearward-facing step N82-12376
STREAMS
Water resources data for New York, water year 1980. Volume 1: Eastern New York excluding Long Island
[PB81-227308] N82-12534
Water resources data for New York, water year 1980. Volume 3: Western New York
[PB81-227316] N82-12535
STRESS ANALYSIS
Experimental investigation of the influence of high power ultrasound on metals N82-12211
Vibration of cylindrical shells and panels of oval cross-section N82-12466
Inelastic finite strain analysis of structural metals subjected to nonproportional loadings N82-12471
Elastic-plastic thick-walled tubes subjected to internal pressure and temperature gradient
[AD-A105243] N82-12477
Use of an engineering data management system in the analysis of space shuttle orbiter tiles
[NASA-TM-83215] N82-12815
STRESS CONCENTRATION
Fatigue phenomena in copper
[RISO-M2241] N82-12225
Three-dimensional stress distribution in arteries: Radial compression experiments of arterial wall; stress concentration in lung near a cylindrical cavity; finite element analysis of pleural surface pressure distribution in dog's lung during electrophrenic stimulation N82-12750
STRESS CORROSION CRACKING
Mechanical properties of a 4142 steel pressure vessel for auxiliary closures
[DE81-030983] N82-12480
Fracture mechanisms of sensitized stainless steels in sulfur-containing environments
[DE81-026052] N82-12482
STRESS CYCLES
Strain and pore pressure behavior of fine grained soils subjected to cyclic shear loading N82-12272
STRESS INTENSITY FACTORS
Influence of a multiaxial membrane stress situation on the stress concentration factor, using the example of an open unfinished drilled hole
[EK-43-B/251/79] N82-12484
STRESS MEASUREMENT
Three-dimensional stress distribution in arteries: Radial compression experiments of arterial wall; stress concentration in lung near a cylindrical cavity; finite element analysis of pleural surface pressure distribution in dog's lung during electrophrenic stimulation N82-12750
STRESS RELAXATION
Compression stress relaxation testing for determining the performance of elastomeric fluid shells N82-12459
STRESS WAVES
A one-dimensional plane wave propagation code for layered rate-dependent hysteretic materials
[AD-A105241] N82-12274
STRESS-STRAIN DIAGRAMS
The effect of pressure on the physical and mechanical properties of Solithane 113 elastomer N82-12229
Properties of confined concrete subjected to static and dynamic loads N82-12468
STRESS-STRAIN RELATIONSHIPS
The relation between welding parameters for a beam section and its buckling resistance
[CRIF-MT-143] N82-12454
Influence of a multiaxial membrane stress situation on the stress concentration factor, using the example of an open unfinished drilled hole
[EK-43-B/251/79] N82-12484
STRONG INTERACTIONS (FIELD THEORY)
Fundamental tests and measures of the structure of matter at short distances
[DE81-030644] N82-12978
STRUCTURAL ANALYSIS
Qualification vibration test report for SD 802 materials experiment
[AD-A105321] N82-12132
Finite element analysis of soil-sheet pile interaction N82-12268
Acoustic emission from concrete specimens
[AD-A105416] N82-12476
Solution of nonlinear structural problems using array processors
[AD-A104987] N82-12800
STRUCTURAL BASINS
The Arrinthrunga formation: Upper Cambrian epeiric carbonates in the Georgina Basin, central Australia
[BMR-BULL-211] N82-12686
STRUCTURAL DESIGN
Interior design for passive solar homes
[DE81-027939] N82-12282
Vocational-Technical Instructors Passive-Solar Training Workshop
[DE81-030055] N82-12622
Flexibilities in passive design: Examining some limiting solar myths
[DE81-026401] N82-12623
DOE small-hydropower demonstration program
[DE81-027619] N82-12636
STRUCTURAL DESIGN CRITERIA
Critical requirements for the design of large space structures
[NASA-CR-3484] N82-12131
Designing process wells for an underground coal-gasification environment
[DE81-028434] N82-12264
Magnetohydrodynamics (MHD) Engineering Test Facility (ETF) 200 MWe power plant. Design Requirements Document (DRD)
[NASA-TM-82705] N82-12446
Steam turbine blades: Considerations in design and a survey of blade failures
[DE81-904249] N82-12450
Thin mirror telescopes: Experience gained with the UK infrared telescope
[UKIRT-14] N82-13027
STRUCTURAL ENGINEERING
An improved model for soil-structure interaction analysis N82-12269
STRUCTURAL FAILURE
Designing process wells for an underground coal-gasification environment
[DE81-028434] N82-12264
A critical void growth failure criterion developed for dynamic and static loading conditions N82-12469
STRUCTURAL PROPERTIES (GEOLOGY)
The Manicouagan impact structure observed from Skylab
[CONTRIB-544] N82-12497
Synthesis of regional crust and upper-mantle structure from seismic and gravity data
[NASA-CR-165001] N82-12696
STRUCTURAL STABILITY
Elastic body dynamics N82-12126
STRUCTURAL STRAIN
Shear waves in buildings subjects to seismic loading
[ISSN-0208-5658] N82-12462
Inelastic finite strain analysis of structural metals subjected to nonproportional loadings N82-12471
STRUCTURAL VIBRATION
Acoustic and vibration environments for laboratory experiments in space N82-12130
SUBMERGING
Liquid immersion apparatus for minute articles
[NASA-CASE-MFS-25363-1] N82-12441
SUBSONIC SPEED
Low-speed measurements of the static pressure distribution and overall forces on a cambered and a symmetric mild gothic wing of aspect ratio 1.4
[RAE-TR-80066] N82-12027
SUBSTRATES
Investigation of solar cells based on Cu2 — with emphasis on junction fabrication
[DE81-030274] N82-12607
An engineering study of bacterial kinetics and energetics N82-12740
Research and development on new technologies for the preparation of III-V semiconductor materials and on methods for evaluation of the quality of these materials. Project Ga(AsP) expitaxial layers and substrates for them
[BMFT-FB-T-81-020] N82-12962
SUITABILITY
Position and hold mount. Demonstration model — Spacelab experiments
[ESA-CR(P)-1460] N82-12106
SULFATES
Scale prevention. Study on the crystallization of calcium sulfate and barium sulfate with and without inhibitors N82-12165
Solid-solid reactions in coal conversion processes N82-12238
Lagrangian measurements of sulfur dioxide to sulfate conversion rates
[DE82-000246] N82-12665
SULFUR
Fracture mechanisms of sensitized stainless steels in sulfur-containing environments
[DE81-026052] N82-12482
SULFUR DIOXIDES
A computer simulation modeling study to predict air quality impacts from a 500 MW coal-fired power plant N82-12650
User manual for SILVA: A computer code for estimating effects of pollution on the growth and succession of Western coniferous forests
[DE82-000134] N82-12664
Lagrangian measurements of sulfur dioxide to sulfate conversion rates
[DE82-000246] N82-12665
SULFURIC ACID
Oxydesulfurization of coal by acidic iron sulfate solutions
[DE82-000464] N82-12199
SUMMER
Summertime results from the class B passive-solar performance-monitoring program
[DE81-025471] N82-12627
SUPERCONDUCTING MAGNETS
The stability and soldering void effect of large superconductor N82-12340
High field superconductors of NbTi with current capacities in excess of 3000A for application in magnet systems with alternating field components
[BMFT-FB-T-81-009] N82-12367
SUPERCONDUCTIVITY
Superconductivity in Th-Nb composites
[DE81-030746] N82-12363

SUPERCONDUCTORS
The stability and soldering void effect of large superconductor N82-12340
High field superconductors of NbTi with current capacities in excess of 3000A for application in magnet systems with alternating field components
[BMFT-FB-T-81-009] N82-12367
Electrical machines with superconducting windings. Part 3: Homopolar dc machines — with rotating liquid metal contacts
[BMFT-FB-T-81-015-PT-3] N82-12369
A systematic study of the effects of 3d, 4f and 5f impurities on the critical temperature of superconducting Th; measurements to 20 kilobars
N82-12958
SUPERCRITICAL WINGS
Subcritical and supercritical airfoils for given pressure distribution N82-12031
SUPERFLUIDITY
Dynamics of superfluid helium in zero gravity --- Spacelab 2 investigation N82-12111
SUPERHIGH FREQUENCIES
S-Band Shallow Bulk Acoustic Wave (SBAW) microwave source
[NASA-CR-166744] N82-12344
SUPERROTATION
The rigid shell component for superrotation in planetary atmospheres: Angular momentum budget, mechanical analog and simulation of the spin up process
[NASA-TM-83831] N82-13033
SUPERSONIC AIRFOILS
Transonic airfoil design of full potential flow. 2: Development of the FORTRAN code
[NAL-TR-673] N82-12614
SUPERSONIC WIND TUNNELS
Description and calibration of the Langley unitary plan wind tunnel
[NASA-TP-1905] N82-12035
SUPPORTS
Position and hold mount. Demonstration model — Spacelab experiments
[ESA-CR(P)-1460] N82-12108
SURFACE ACOUSTIC WAVE DEVICES
Implementation of SAW chirp transform and SAW convolvers in spread spectrum communication systems N82-12341
Piezoelectric ZnS film on silicon
[AD-A105161] N82-12359
SURFACE DEFECTS
Photovoltaic mechanisms in polycrystalline thin film silicon solar cells
[DE81-030370] N82-12606
Surface structure and growth of crystalline materials
[AD-A105223] N82-12956
SURFACE DISTORTION
Study and development of face-contact, bellows mechanical seal for liquid hydrogen turbopump
[NAL-TR-653] N82-12443
SURFACE FINISHING
Thermal desorption spectra, equilibrium desorption rates and equilibrium surface coverages of mechanically polished and of sand and bead blasted Inconel 600 surfaces
[EUR-7114-EN] N82-12224
Metal-finishing processes: Surface-finish improvement
[DE81-030166] N82-12275
Facing on stamping dies — testing wear resistance
[CETIM-1.3K.26.2] N82-12460
SURFACE LAYERS
The gravity wave in a liquid with a surface film, in the presence of an applied electric field
[REPT-80-2] N82-12406
Boundary detection criteria for satellite altimeters
[NASA-CR-156860] N82-12734
SURFACE PROPERTIES
Photothermal measurement of optical surface absorption using strain transducers
[AD-A104745] N82-12420
SURFACE REACTIONS
Surface chemical reactions on stationary or rotating bodies in nonisothermal laminar boundary layer flows
N82-12153
SURFACE ROUGHNESS
Progress in radar snow research — Brookings, South Dakota
[NASA-CR-166709] N82-12510
SURFACE TEMPERATURE
Emission spectra from EHD contacts N82-12465
SURFACE VEHICLES
Phase sensitive guidance sensor for wire-following vehicles
[NASA-CASE-NPO-15341-1] N82-12346
SURFACE WATER
Bibliography of the seasonal thermal energy storage library
[DE81-030470] N82-12586
SURFACE WAVES
Determination of crustal Q structure from multi-mode surface waves N82-12682
Investigations of the reflection, transmission, and conversion of ultrasonic waves N82-12888
SURVEILLANCE
Target assessment performance with 5 inch and 9 inch television monitors
[DE81-026754] N82-12317
SWEPT WINGS
HADY-I, a FORTRAN program for the compressible stability analysis of three-dimensional boundary layers --- on swept and tapered wings
[NASA-CR-3467] N82-12388
SWIRLING
Laminar-flow-cyclone development program
[DE81-001297] N82-12399
SYNCHRONISM
Optimal synchronization for a distributed database
N82-12791
Multicast and synchronization in distributed systems --- algorithms
[CTH-81.2-R] N82-12635
SYNOPTIC METEOROLOGY
Terminal forecast reference notebook, detachment 12, 15th weather squadron for Selfridge Air National Guard Base, Michigan
[AD-A105063] N82-12727
Terminal forecast reference notebook for Scott Air Force Base, Illinois
[AD-A105064] N82-12728
SYNTHANE
Assessment of potential future markets for the production of hydrogen from water
[BMFT-FB-T-81-012] N82-12266
SYNTHESIS (CHEMISTRY)
A search for new fuel components in explosive mixtures with ammonium nitrate
[AD-A104881] N82-12245
SYNTHETIC APERTURE RADAR
Multiple arrested synthetic aperture radar
N82-12295
Real-time multiple-look synthetic aperture radar processor for spacecraft applications
[NASA-CASE-NPO-14054-1] N82-12297
A pipelined digital SAR azimuth correlator using hybrid FFT/transversal-filter
[NASA-CASE-NPO-15519-1] N82-12298
SYNTHETIC FUELS
Status of the Great Plains coal gasification plant
[EMD-81-64] N82-12242
Development of catalytic systems for the conversion of syngas to jet fuel and diesel fuel and higher alcohols
[DE82-000067] N82-12255
Synthesis gas conversion to liquid fuels using promoted fused iron catalysts
[DE81-030657] N82-12259
Development of hydroconversion of biomass to synthetic fuels
[DE81-030954] N82-12260
Low NO sub x heavy fuel combustor concept program
[NASA-CR-165512] N82-12572
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic fuels production
[DE81-030622] N82-12661
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic-fuels production
[DE81-030671] N82-12673
SYSTEM EFFECTIVENESS
The effect of phase errors on the performance of the CAISSA antenna
[PHL-1979-45] N82-12326
Evaluation of the performance of a simplified MTI canceller selection rule for FUCAS — radar target selection
[PHL-1981-24] N82-12330
SYSTEM FAILURES
Simulation of a telecommunication distress system — MARECS satellite
[ESA-CR(P)-1449] N82-12322
Upgrading the intense neutron source high voltage power supply
[DE81-026970] N82-12364
SYSTEM IDENTIFICATION
Study to define an approach for developing a computer-based system capable of automatic, unattended assembly/disassembly of spacecraft, phase 1
[NASA-CR-166740] N82-12092
SYSTEMS ANALYSIS
Study to define an approach for developing a computer-based system capable of automatic, unattended assembly/disassembly of spacecraft, phase 1
[NASA-CR-166740] N82-12092
Generalized study of a hydraulically actuated mechanism system N82-12375
System performance conclusions N82-12539
Guidebook for solar process-heat applications
[DE81-027977] N82-12598
Satisfactory solutions approach to control and optimization of large-scale systems N82-12883
SYSTEMS ENGINEERING
Study to define an approach for developing a computer-based system capable of automatic, unattended assembly/disassembly of spacecraft, phase 1
[NASA-CR-166740] N82-12092
Handbook for the estimation of microwave propagation effects: Link calculations for earth-space paths (path loss and noise estimation)
[NASA-CR-165002] N82-12301
Upgrading the intense neutron source high voltage power supply
[DE81-026970] N82-12364
Magnetohydrodynamics (MHD) Engineering Test Facility (ETF) 200 MWe power plant. Design Requirements Document (DRD)
[NASA-TM-82705] N82-12446
Design and breadboard evaluation of the SPS reference phase control system concept
N82-12545
Flexibilities in passive design: Examining some limiting solar myths
[DE81-026401] N82-12623
Solar project at Almeria nears completion
N82-12647
SYSTEMS INTEGRATION
A look inside the Langley 16-foot transonic tunnel: User's guide
[NASA-TM-83186] N82-12065
SYSTEMS MANAGEMENT
Cybernetics and car driving: A mathematical (computer) model for the system to be controlled
[IZF-1980-4] N82-12775
Computer-based national information systems: Technology and public policy issues. Summary
N82-12990
Government management of data processing
N82-12996
SYSTEMS SIMULATION
Efficient implementations of multicounter machines for oblivious Turing machines, acyclic logic networks, and VLSI
[MC-IW-167/81] N82-12606

T

TABLES (DATA)
Earthquakes in the United States, July - September 1979
[USGS-CIRC-836-C] N82-12690
Earthquakes in the United States, January - March 1979
[CIRC-836-A] N82-12691
Adverse weather and night capability: A call for action. Volume 2: Appendix, data base for selected important military locations
[AD-A104991] N82-12726
Compilation of cell data bank for automation in diagnostic cytology
[BMFT-FB-T-80-158] N82-12742
Inventory of medical technological research in the Netherlands N82-12767

TANTALUM ALLOYS
Thermotransport of hydrogen and deuterium in vanadium, niobium and tantalum alloys N82-12208
TARGET ACQUISITION
Multiple arrested synthetic aperture radar N82-12295
Military geodesy and geospace science, unit two [AD-A105071] N82-12703
TARGET RECOGNITION
Evaluation of the performance of a simplified MTI canceller selection rule for FUCAS — radar target selection [PHL-1981-24] N82-12330
How to display digital SONAR signals. Some primary threshold measurements [IZF-1979-16] N82-12773
The efficiency of detecting tribar patterns modulated in random dot density [IZF-1980-25] N82-12779
TASKS
Study to define an approach for developing a computer-based system capable of automatic, unattended assembly/disassembly of spacecraft, phase 1 [NASA-CR-166740] N82-12092
TAYLOR INSTABILITY
The Rayleigh-Taylor and Kelvin-Helmholtz instabilities in targets accelerated by laser ablation [AD-A104804] N82-12433
Stabilization of Rayleigh-Taylor instability due to the spontaneous magnetic field in laser produced plasma [IPPJ-537] N82-12942
TECHNETIUM ISOTOPES
Biogeochemical studies of technetium in marine and estuarine ecosystems [DE81-030325] N82-12672
TECHNOLOGICAL FORECASTING
Technology of tomorrow: Computer assisted design and fabrication [CETIM-1.4A.32.3] N82-12828
Trends in computer technology N82-13002
TECHNOLOGY ASSESSMENT
China report: Science and technology, no. 133 [JPRS-79301] N82-12104
Assessment of pulverized-coal-fired combustor performance [DE81-030860] N82-12187
State of the art of methane gas enhancement in landfills [DE82-000155] N82-12253
Assessment of rotor-bearing dynamics: A planning study for the utility industry [DE81-904242] N82-12451
Extensible bridge-conveyor concepts for coal-mine face haulage [DE81-031974] N82-12525
Considerations for high accuracy radiation efficiency measurements for the Solar Power Satellite (SPS) subarrays N82-12559
Session on solid state: Introduction N82-12565
Utilization of waste heat from major transformer substations. Volume 1: Generic study [DE81-904212] N82-12593
Utilization of waste heat from major transformer substations. Volume 2: Site-specific study [DE81-904236] N82-12594
Modelling energy-economic interactions in developing countries: A linear-programming approach [DE81-026048] N82-12637
Technology characterizations: Environmental information handbook, second edition [DE81-029993] N82-12671
China report: Science and technology, no. 128 [JPRS-79047] N82-12789
Numerical techniques in linear duct acoustics, 1980-81 update [NASA-TM-82730] N82-12890
Information systems and computers N82-12992
TECHNOLOGY TRANSFER
China report: Science and technology, no. 133 [JPRS-79301] N82-12104
China report: Science and technology, no. 128 [JPRS-79047] N82-12789
Biomedical technology transfer. Applications of NASA science and technology [NASA-CR-164991] N82-13012
TECHNOLOGY UTILIZATION
China report: Science and technology, no. 133 [JPRS-79301] N82-12104
Use of SKW-9 single launch vehicle for three satellites described N82-12105
Methodical study of the contribution of the human system to the insecurity of technological systems — computerized accident analysis N82-12788
China report: Science and technology, no. 128 [JPRS-79047] N82-12789
Computer-based national information systems: Technology and public policy issues [OTA-CIT-146] N82-12989
TECTONICS
Global Tectonics: Some Geologic analyses of observations and photographs from Skylab N82-12494
NASA geodynamics program [NASA-TM-84010] N82-12697
Synthesis of regional crust and upper-mantle structure from seismic and gravity data [NASA-CR-165001] N82-12698
TELECOMMUNICATION
Simulation of a telecommunication distress system — MARECS satellite [ESA-CR(P)-1449] N82-12322
TELEMETRY
MLS performance assessment, task 4. Volume 1: Evaluation procedures and equipment design [AD-A105393] N82-12061
PC-403: Pioneer Venus multiprobe spacecraft mission operational characteristics document, volume 2 [NASA-CR-166261-VOL-2] N82-12088
TELEVISION EQUIPMENT
An evaluation of the performance of 12 GHz low cost TVRO terminals in northwestern Ontario — ground terminals for ANIK B [CRC-1345] N82-12299
Target assessment performance with 5 inch and 9 inch television monitors [DE81-026754] N82-12317
TELEVISION RECEPTION
An evaluation of the performance of 12 GHz low cost TVRO terminals in northwestern Ontario — ground terminals for ANIK B [CRC-1345] N82-12299
TEMPERATURE DEPENDENCE
A phenomenological theory for predicting the temperature dependence of elastic compliance in simple proper ferroelectric tungstenbronzes N82-12214
Analysis of the temperature dependence of resistivity in N-type silicon [AD-A105192] N82-12976
TEMPERATURE EFFECTS
Thermal desorption spectra, equilibrium desorption rates and equilibrium surface coverages of mechanically polished and of sand and bead blasted Inconel 600 surfaces [EUR-7114-EN] N82-12224
An investigation of sand and sandstone permeability degradation at elevated temperature and pressure N82-12683
TEMPERATURE GRADIENTS
Heat flow studies and geothermal exploration in western Trans-Pecos Texas N82-12684
Stabilization of Rayleigh-Taylor instability due to the spontaneous magnetic field in laser produced plasma [IPPJ-537] N82-12942
Study of 1/f noise in solids [AD-A105219] N82-12966
TEMPERATURE MEASUREMENT
CARS spectroscopy of gun propellant flames [AD-A105224] N82-12177
Study of 1/f noise in solids [AD-A105219] N82-12966
TENSILE PROPERTIES
Mechanical properties of a 4142 steel pressure vessel for auxiliary closures [DE81-030983] N82-12480
TENSILE STRENGTH
Mechanical properties and hydrogen embrittlement of scandium [DE81-030745] N82-12221
Silver films for solid state bonding [DE82-000414] N82-12223
The behavior and strength of lapped splices in reinforced concrete beams subjected to cyclic loading N82-12470
TENSILE TESTS
Mechanical properties of titanium castings [DE81-030693] N82-12222
TERMINAL BALLISTICS
Military geodesy and geospace science, unit two [AD-A105071] N82-12703
TERMINAL FACILITIES
Analysis of integrated fuel-efficient, low-noise procedures in terminal-area operations [DE81-029833] N82-13014
TERMS
A general thesaurus for the German Library. Pilot study [BMFT-FB-ID-80-015] N82-13009
TEST FACILITIES
Use of Sandia's Central Receiver Test Facility as a high-intensity heat source for testing missile nose-cone (radome) radar systems [DE82-000968] N82-12086
Voltage test facility for defence standard 61-5 [NGTE-M-80112(L)] N82-12370
Magnetohydrodynamics (MHD) Engineering Test Facility (ETF) 200 MWe power plant. Design Requirements Document (DRD) [NASA-TM-82705] N82-12446
TEST RANGES
Conspicuity of observation posts at the air weapon firing ranges on the Vliehors and the Noordvaarder [IZF-1979-33-E] N82-12774
TESTS
Voltage test facility for defence standard 61-5 [NGTE-M-80112(L)] N82-12370
TETRODES
Electrode design and performance of the ORNL positive ion sources [DE81-030426] N82-12910
TEXAS
Heat flow studies and geothermal exploration in western Trans-Pecos Texas N82-12684
TEXTS
Defense Technical Information Center free text experiment: Technical report file [AD-A105449] N82-13007
TF-34 ENGINE
Effect of a part span variable inlet guide vane on TF34 fan performance [NASA-CR-165458] N82-12075
THAILAND
Remote sensing studies of some ironstone gravels and plinthite in Thailand N82-12491
THEOREM PROVING
Two theorems about the completeness of Hoare's logic [MC-IW-165/81] N82-12862
THEOREMS
The numerical solution of Fredholm integral equations of the first kind N82-12843
THERMAL ABSORPTION
Improvement of thermal efficiency of flat plate solar collectors [BMFT-FB-T-80-194] N82-12642
THERMAL BOUNDARY LAYER
Global isostatic geoid anomalies for plate and boundary layer models of the lithosphere [NASA-CR-164965] N82-12695
THERMAL CONDUCTIVITY
Measurement of thermal conductivities in coal fluids [DE82-000523] N82-12400
THERMAL DEGRADATION
Thermal oxidative degradation reactions of perfluoroalkylethers [NASA-CR-165516] N82-12135
THERMAL DIFFUSION
Thermotransport of hydrogen and deuterium in vanadium, niobium and tantalum alloys N82-12208
THERMAL DISSOCIATION
Measurement procedure to determine organic compounds in water (combustion method) [BMFT-FB-T-81-014] N82-12206
THERMAL ENERGY
Study of ATES thermal behavior using a steady flow model [DE81-030683] N82-12396

Solar thermal central receivers for industrial process heat generation: User views and recommendations for commercialization
[DE81-029911] N82-12616

Department of Energy Solar Central Receiver Semiannual Meeting
[SAND-80-8049] N82-12632

THERMAL INSULATION

Energy efficiency buildings program
[DE81-028050] N82-12276

The window and its heat balance considering solar radiation and additional insulation measures
[BMFT-FB-T-80-070] N82-12402

THERMAL MAPPING

Heat flow studies and geothermal exploration in western Trans-Pecos Texas N82-12664

THERMAL PROTECTION

Progress in protective coatings for aircraft gas turbines: A Review of NASA sponsored research
[NASA-TM-82740] N82-12216

A tile-gap flow model for use in aerodynamic loads assessment of space shuttle thermal protection system: Parallel gap faces
[NASA-TM-83151] N82-12387

Use of an engineering data management system in the analysis of space shuttle orbiter tiles
[NASA-TM-83215] N82-12615

Research and Technology
[NASA-TM-83221] N82-13043

THERMAL RADIATION

Advanced combustion/plume diagnostics
[AD-A105115] N82-12173

THERMAL RESISTANCE

Formulation and characterization of polyimide resilient foams of various densities for aircraft seating applications
[NASA-CR-167421] N82-12230

THERMAL SIMULATION

Use of Sandia's Central Receiver Test Facility as a high-intensity heat source for testing missile nose-cone (radome) radar systems
[DE82-000968] N82-12096

THERMAL STABILITY

Thermal oxidative degradation reactions of perfluoroalkylethers
[NASA-CR-165516] N82-12135

THERMAL STRESSES

Study of hollow corner retroreflectors for use in a synchronous orbit
[NASA-CR-166750] N82-12931

THERMIONIC CONVERTERS

Study of radiatively sustained cesium plasmas for solar energy conversion
[NASA-CR-168265] N82-13039

THERMODYNAMIC CYCLES

Economic assessment of advanced central-receiver solar-thermal power systems: Executive summary
[DOE/SF-10601/0] N82-12624

THERMODYNAMIC EFFICIENCY

The calculation of heat exchanger performance
[HTS/81/5] N82-12412

Advanced cooling full-scale engine demonstration
[DE81-904253] N82-12452

Optimization of solar heating and cooling systems
[NP-1903997] N82-12599

Seasonal performance factors for active solar systems and heat-pump systems
[DE81-028569] N82-12625

Improvement of thermal efficiency of flat plate solar collectors
[BMFT-FB-T-80-194] N82-12642

End region and current consolidation effects upon the performance of an MHD channel for the ETF conceptual design
[NASA-TM-82744] N82-12943

THERMODYNAMIC EQUILIBRIUM

Analytical expressions for specific heats and isentropic exponents of high-temperature gases with their applications
[NAL-TR-671] N82-12984

THERMODYNAMIC PROPERTIES

Simple code for chemical equilibrium and thermodynamic properties for use with GPSAP
[ANL/MHD-81-11] N82-12183

Electrochemical models for the discharge characteristics of the nickel cadmium cell
[NASA-TM-83814] N82-12589

Technical databook for geothermal energy utilization
[DE81-029968] N82-12614

Latent heat storage devices. Part 1: Characteristics and applicability of latent heat storage devices
[BMVG-FBWT-79-12-PT-1] N82-12636

Simulation of the thermal behavior of an object and its nearby surroundings
[PHL-1980-08] N82-12683

Development of a thermodynamic properties correlation framework for the coal conversion industry, phase 1A
[DE81-030363] N82-12985

THERMODYNAMICS

Study of ATES thermal behavior using a steady flow model
[DE81-030883] N82-12396

Methods of calculating heat transfer within the passages of heat exchangers
[HTS/81/4] N82-12411

THERMOELASTICITY

Theory of thermoelasticity
[NASA-TM-75810] N82-12473

THERMOELECTRIC GENERATORS

Study of radiatively sustained cesium plasmas for solar energy conversion
[NASA-CR-168265] N82-13039

THERMOGRAVIMETRY

Acetylene terminated phenylene thermoset systems
[AD-A105394] N82-12176

THERMOPLASTIC RESINS

Glass-mat-reinforced thermoplastic: Strong, easy to work N82-12646

THERMOSETTING RESINS

Acetylene terminated phenylene thermoset systems
[AD-A105394] N82-12176

THERMOSPHERE

Impedance probe experiment in project Polar High Atmosphere of the Sounding Rocket Program Aeronomy
[BMFT-FB-W-80-035] N82-12710

THESAURI

A general thesaurus for the German Library. Pilot study
[BMFT-FB-ID-80-015] N82-13009

THICK WALLS

Elastic-plastic thick-walled tubes subjected to internal pressure and temperature gradient
[AD-A105243] N82-12477

THICKNESS RATIO

Thin mirror telescopes: Experience gained with the UK infrared telescope
[UKIRT-14] N82-13027

THIN FILMS

Piezoelectric ZnS film on silicon
[AD-A105161] N82-12359

Investigation of solar cells based on Cu2 — with emphasis on junction fabrication
[DE81-030274] N82-12607

Integration of a detector array with an optical waveguide structure and applications to signal processing
[AD-A105067] N82-12932

Selected area growth for digital integrated circuits and atomic plane doping of gallium arsenide by molecular beam epitaxy N82-12956

Modeling of thin-film GaAs growth
[NASA-CR-164992] N82-12965

THIN PLATES

Laminated anisotropic reinforced plastic plates and shells
[NASA-TM-76585] N82-12474

Buckling of a thin initially wrinkled rectangular plate
[DE81-029963] N82-12479

THIN WALLED SHELLS

Vibration of cylindrical shells and panels of oval cross-section N82-12486

THORIUM ALLOYS

Superconductivity in Th-Nb composites
[DE81-030748] N82-12363

A systematic study of the effects of 3d, 4f and 5f impurities on the critical temperature of superconducting Th; measurements to 20 kilobars
N82-12958

THREE AXIS STABILIZATION

Thruster-exhaust-plume-impingement disturbance torque of three-axis-stabilized satellite
[NAL-TR-670] N82-12100

THREE DIMENSIONAL BOUNDARY LAYER

HADY-I, a FORTRAN program for the compressible stability analysis of three-dimensional boundary layers — on swept and tapered wings
[NASA-CR-3467] N82-12388

THREE DIMENSIONAL FLOW

Three dimensional flow investigation with a method of characteristics in the inlet region and the blade-to-blade channels of supersonic axial compressors
[ESA-TT-637] N82-12078

Three dimensional simulation model MODIS for the propagation of air pollutants
[GKSS-80-E-50] N82-12677

The three dimensional spherical model for the AGCE N82-12721

THRESHOLD CURRENTS

Threshold criteria for a space simulation beam-plasma-discharge
[AD-A104937] N82-12948

THRESHOLDS (PERCEPTION)

Thresholds of hearing by air conduction and by bone conduction under different masking conditions
[NPL-AC-100] N82-12768

How to display digital SONAR signals. Some primary threshold measurements
[IZF-1979-16] N82-12773

The efficiency of detecting triber patterns modulated in random dot density
[IZF-1980-25] N82-12779

Effect of the orientation of the speaker's head and azimuth of a noise source on the speech reception threshold for sentences
[IZF-1980-18] N82-12696

THRUST VECTOR CONTROL

Effect of a part span variable inlet guide vane on TF34 fan performance
[NASA-CR-165456] N82-12075

Exceedance statistics of accelerations resulting from thruster firings on the Apollo-Soyuz mission
N82-12127

TILES

A tile-gap flow model for use in aerodynamic loads assessment of space shuttle thermal protection system: Parallel gap faces
[NASA-TM-83151] N82-12387

Use of an engineering data management system in the analysis of space shuttle orbiter tiles
[NASA-TM-83215] N82-12615

TIMBER INVENTORY

Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] N82-12604

TIME

A study of time evolution of continuous vortex loops in a homogeneous or stratified fluid N82-12381

TIME DIVISION MULTIPLEXING

A design procedure for time-varying digital filters with highly quantized coefficients N82-12336

TIME FUNCTIONS

Space-time clustering analysis N82-12866

TIME LAG

A survey of some problems and recent results for parameter estimation and optimal control in delay and distributed parameter systems
[NASA-CR-16491] N82-12839

TIME OF FLIGHT SPECTROMETERS

Time-of-flight spectroscopy of molecular structure, collision processes and gas-surface interactions
[AD-A105436] N82-12896

TIME OPTIMAL CONTROL

Optimal adaptive stochastic control of linear dynamical systems with multiplicative and additive noise N82-12868

TIME SERIES ANALYSIS

Detecting outliers in energy time-series data
[DE81-030230] N82-12588

Minimum mean square error prediction of autoregressive moving average time series
[AD-A104939] N82-12848

On the computation of optimal designs for certain time series models with applications to optimal quantile selection for location or scale parameter estimation
[AD-A104935] N82-12875

Comments on the measurement of linear dependence and feedback between multiple time series by John Geweke
[AD-A104741] N82-12877

The finite memory prediction of covariance stationary time series
[AD-A105413] N82-12878
On some numerical properties of ARMA parameter estimation procedures
[AD-A104938] N82-12879
Preliminary internal data screening: A component of quantitative data analysis in data validation
[DE81-000502] N82-13008

TISSUES (BIOLOGY)
Quantitation of tissue loss during prolonged space flight
[NASA-CR-167460] N82-12752

TITANIUM ALLOYS
Investigation of the electrochemical behavior of ion-implanted Ti-Pt alloys N82-12212
Mechanical properties of titanium castings
[DE81-030693] N82-12222
Friction and wear behavior of Ti-6Al-4V and a Ni base alloy (Hastelloy C-276) N82-12439
Miniaturized fatigue crack growth specimen technology and results
[DE81-029757] N82-12481

TITANIUM COMPOUNDS
Cutting tool coatings program
[DE81-026269] N82-12449

TOKAMAK DEVICES
Electrode design and performance of the ORNL positive ion sources
[DE81-030426] N82-12910
ECR discharge cleaning experiment in the JIPP T-11
[IPPJ-539] N82-12940
Novel limiter pump topologies
[DE81-030029] N82-12947
Electron cyclotron damping for large wave amplitude in Tokamak plasmas
[EUR-CEA-FC-1053] N82-12948
Plasma research laboratory report, 1979
[INIS-MF-6067] N82-12955

TOLERANCES (PHYSIOLOGY)
Damage risk criteria for impulse noise — industrial deafness
[IZF-1980-26] N82-12771

TOLUENE
Supercritical multicomponent solvent coal extraction
[NASA-CASE-NPO-15767-1] N82-12241
Measurement of thermal conductivities in coal fluids
[DE82-000523] N82-12400

TOPOLOGY
Novel limiter pump topologies
[DE81-030029] N82-12947

TOROIDAL PLASMAS
High-mode-number MHD stability of a toroidal multipole
[DE81-030484] N82-12950
Plasma research laboratory report, 1979
[INIS-MF-6067] N82-12955

TORQUE
Thruster-exhaust-plume-impingement disturbance torque of three-axis-stabilized satellite
[NAL-TR-670] N82-12100

TOWERS
Technical heat and flow investigations into heat exchangers made out of synthetic materials, for use in dry cooling towers
[BMFT-FB-T-81-004] N82-12407

TOXIC HAZARDS
Microbial methane fermentation kinetics for toxicant exposure
[AD-A104868] N82-12243
The handling, hazards, and maintenance of heavy liquids in the geologic laboratory
[USGS-CIRC-827] N82-12273
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic fuels production
[DE81-030622] N82-12661
An approach to the management of hazardous materials
[AD-A104869] N82-12987

TOXICITY
Oxygen toxicity and lung collagenous protein
[AD-A104702] N82-12756
Identification and toxicity of fractionated-shale-oil components
[DE81-028460] N82-12766

TRACE CONTAMINANTS
Requirements document for mini system test unit
[NASA-CR-167436] N82-12167

TRACE ELEMENTS
Inductively coupled plasma as an ion source for the determination of trace elements in solutions by mass spectrometry
[DE81-030744] N82-12192
Limit on remote FTIR detection of trace gases
[AD-A104842] N82-12511

TRACKING FILTERS
Evaluation of the performance of a simplified MTI canceller selection rule for FUCAS — radar target selection
[PHL-1981-24] N82-12330

TRACTION
Design study of a continuously variable roller cone traction CVT for electric vehicles
[NASA-CR-159841] N82-12445

TRAFFIC
Assignment techniques for heavily loaded networks
[A-79-VK-45-07] N82-12988

TRAJECTORY ANALYSIS
Automatic plotting routines for estimating static aerodynamic properties of long rod finned projectiles for 2,M,5
[AD-A104900] N82-12046

TRAJECTORY OPTIMIZATION
Application of singular perturbation theory
N82-12050

TRANSCONTINENTAL SYSTEMS
Transportation systems evaluation methodology development and applications, phase 3
[NASA-CR-164999] N82-12051

TRANSFORMATIONS (MATHEMATICS)
Using program transformations to derive line-drawing algorithms
[AD-A104873] N82-12817

TRANSIENT RESPONSE
Transient thermal convection in microgravity
N82-12121

TRANSISTOR AMPLIFIERS
Solid-state retrodirective phased array concepts for microwave power transmission from Solar Power Satellite N82-12568

TRANSISTOR CIRCUITS
Study of 1/f noise in solids
[AD-A105219] N82-12966

TRANSIT TIME
Determination of geographic longitudes, latitudes and azimuths with the transit instrument AP in the test grid Westharz
[SER-B-249] N82-12532

TRANSITION TEMPERATURE
Acetylene terminated phenylene thermoset systems
[AD-A105394] N82-12176
Liquidus temperatures of commercial ESR slags
[AD-A105268] N82-12217

TRANSLATIONAL MOTION
Axial translation of field-reversing relativistic electron rings N82-12915

TRANSMISSION EFFICIENCY
Columbus, Ohio, Voice response system demonstration and evaluation
[AD-A104750] N82-12304
Considerations for high accuracy radiation efficiency measurements for the Solar Power Satellite (SPS) subarrays N82-12559

TRANSMISSION LINES
Portable air driven variable speed fiber optic cable termination polisher
[AD-A104797] N82-12448

TRANSMISSIONS (MACHINE ELEMENTS)
Design study of a continuously variable roller cone traction CVT for electric vehicles
[NASA-CR-159841] N82-12445

TRANSMITTER RECEIVERS
Design and breadboard evaluation of the SPS reference phase control system concept
N82-12545

TRANSMITTERS
Coherent multiple tone technique for ground based SPS phase control N82-12546

TRANSONIC FLOW
Transonic airfoil design of full potential flow. 1: Numerical procedure and its computational examples
[NAL-TR-672] N82-12038
A symposium on transonic flow research
[AD-A104871] N82-12044
Calculation of stationary transonic flows using the integral equation method
[REPT-374] N82-12049
Transonic airfoil design of full potential flow. 2: Development of the FORTRAN code
[NAL-TR-673] N82-12814

TRANSONIC WIND TUNNELS
Aeroelasticity matters: Some reflections on two decades of testing in the NASA Langley transonic dynamics tunnel
[NASA-TM-83210] N82-12041
Construction and performance of NAL two-dimensional transonic wind tunnel
[NAL-TR-647] N82-12083
A look inside the Langley 16-foot transonic tunnel: User's guide
[NASA-TM-83186] N82-12085

TRANSPORT AIRCRAFT
In-service inspection methods for graphite-epoxy structures on commercial transport aircraft
[NASA-CR-165746] N82-12142

TRANSPORT PROPERTIES
Pitch-angle diffusion in canonical coordinates: A theoretical formulation
[AD-A105392] N82-12701
Silicon transport epitaxy — low temperature epitaxial process
[BMFT-FB-T-80-165] N82-12980

TRANSURANIUM ELEMENTS
Nuclear waste incineration technology status
[DE81-025751] N82-12926

TRAPATT DEVICES
The effect of optically enhanced leakage current on S-band TRAPATT diode oscillators N82-12342

TRAPPED VORTEXES
Long ocean waves on linearly varying bottom topographies N82-12733

TRAVELING IONOSPHERIC DISTURBANCES
An experimental study of the propagation and dispersion of internal atmospheric gravity waves
N82-12681

TREES (PLANTS)
Effects of preignition on pulverized coal combustion
[DE81-030170] N82-12195

TRENDS
Advantages and limitations of various materials used in the construction of modules — aircraft construction
[SNIAS-812-551-103] N82-12072

TRESCA FLOW
Simulation of the flow during stamping: Characteristics and application of modeling clay used for simulation of material flow in a forge
[CETIM-1.3K.28.2] N82-12286

TRIANGULATION
Determination of geographic longitudes, latitudes and azimuths with the transit instrument AP in the test grid Westharz
[SER-B-249] N82-12532

TRIBOLOGY
Tribology experiment — journal bearings and liquid lubricants N82-12117

TROMBE WALLS
Comparative economic performance of selected passive solar heating and cooling technologies
[DE81-030220] N82-12600

TROPICAL STORMS
Some aspects of tropical storm structure revealed by handheld-camera photographs from space
N82-12507

TROPOSPHERIC WAVES
Morphology of stratospheric planetary waves
[AD-A105006] N82-12704

TUBE HEAT EXCHANGERS
Substituting copper alloy tubes in old sea water condensers
[VTT-87] N82-12226
Technical heat and flow investigations into heat exchangers made out of synthetic materials, for use in dry cooling towers
[BMFT-FB-T-81-004] N82-12407
Feasibility study on the fabrication of longitudinally welded heat exchanger tubes for sea water desalination plants on a factory ship
[BMFT-FB-M-80-004] N82-12453

TUNABLE LASERS
Excess noise in tunable diode lasers
[NASA-TP-1935] N82-12431

TUNGSTEN
Retrofit and acceptance test of 30-cm ion thrusters
[NASA-CR-165259] N82-12133
Electron field emission tunneling spectroscopy of platinum group and tungsten metals in the presence of molecular gas and noble metal adsorbates
N82-12957

TUNGSTEN ALLOYS
A phenomenological theory for predicting the temperature dependence of elastic compliance in simple proper ferroelectric tungstenbronzes
N82-12214

TUNGSTEN OXIDES
Investigation of electrochromic effects for display application
[BMFT-FB-T-80-196] N82-12366

TUNNEL DIODES
Measurement of pair-quasiparticle interference in Josephson tunnel junctions
[AD-A105251] N82-12972

TURBIDITY
Calibration of a turbidity meter for making estimates of total suspended solids concentrations and beam attenuation coefficients in field experiments
[NASA-TM-81873] N82-12655

TURBINE BLADES
Progress in protective coatings for aircraft gas turbines: A Review of NASA sponsored research
[NASA-TM-82740] N82-12216
Steam turbine blades: Considerations in design and a survey of blade failures
[DE81-904249] N82-12450
Advanced cooling full-scale engine demonstration
[DE81-904253] N82-12452

TURBINE PUMPS
Study and development of face-contact, bellows mechanical seal for liquid hydrogen turbopump
[NAL-TR-663] N82-12443
Innovative equipment for small-scale hydro developments
[DE81-027820] N82-12634

TURBOCOMPRESSORS
Three dimensional flow investigation with a method of characteristics in the inlet region and the blade-to-blade channels of supersonic axial compressors
[ESA-TT-637] N82-12078

TURBOGENERATORS
Vertical-axis wind-turbine control strategy
[DE81-031932] N82-12591

TURBOJET ENGINES
Vibration test procedures for accessory angle drive gearboxes on Atar 09C engines --- turbojet engines
[AD-A105269] N82-12076

TURBOMACHINE BLADES
Interaction of upstream flow distortions with high Mach number cascades
[NASA-TM-82759] N82-12043

TURBOMACHINERY
Wake boundary layer interaction in turbomachinery
N82-12028
Assessment of rotor-bearing dynamics: A planning study for the utility industry
[DE81-904242] N82-12451

TURBULENCE
Wake boundary layer interaction in turbomachinery
N82-12028
Description and calibration of the Langley unitary plan wind tunnel
[NASA-TP-1905] N82-12035
Calculation and measurement of the turbulence of an incompressible flow in a labyrinth seal between a rotating shaft and a cylinder at rest
[EPFL-ITA-8] N82-12352
Statistical averaging in position determination by holography under turbulence conditions N82-12417

TURBULENT DIFFUSION
Toward an understanding of the turbulent electrode effect over land
[AD-A104902] N82-12700

TURBULENT FLOW
The numerical solution of incompressible turbulent flow over airfoils N82-12030
An experimental study of a turbulent vortex ring
N82-12032
The coherent structure of turbulent mixing layers. 1: Similarity of the primary vortex strucuture. 2: Secondary streamwise vortex structure N82-12033
Self-sustained oscillations of a mixing layer. Edge system N82-12374
On the manipulation of spreading rates of forced mixing layers
[AD-A105236] N82-12390
Laminar-flow-cyclone development program
[DE81-001297] N82-12399
Ring eddy flow metamorphosis as a basis for implosion of partial vacuums, Schwenk's drop picture method and cutting by means of a water jet
[MPIS-13/1980] N82-12401
Hydrostatic calculations of axisymmetric flow and its stability for the AGCE model N82-12718

TURBULENT MIXING
The coherent structure of turbulent mixing layers. 1: Similarity of the primary vortex strucuture. 2: Secondary streamwise vortex structure N82-12033

TURING MACHINES
Efficient implementations of multicounter machines for oblivious Turing machines, acyclic logic networks, and VLSI
[MC-IW-167/81] N82-12806

TWINNING
Microstructure formation in the Au-SiO2 cermet during annealing N82-12227

TWO DIMENSIONAL FLOW
Prediction of the incompressible flow over a rearward-facing step N82-12376
Computation of general two-dimensional steady viscous flows
[AD-A105232] N82-12389
A two-dimensional study of the maximum power that can be obtained from a wind turbine in a wind shear layer
[FFA-134] N82-12537

TWO PHASE FLOW
Two-phase flow and heat transfer under low gravity N82-12116
Advanced combustion/plume diagnostics
[AD-A105115] N82-12173
Numerical computation of two phase flow in gun barrels
[HTS/81/6] N82-12413

U

ULTRAHIGH FREQUENCIES
The 94GHz propagation facility at the Ypenburg airfield and the first experimental results --- attenuation
[PHL-1979-34] N82-12325

ULTRASONIC RADIATION
Experimental investigation of the influence of high power ultrasound on metals N82-12211
Investigations of the reflection, transmission, and conversion of ultrasonic waves N82-12888

ULTRASONICS
Some aspects of ultrasonic nonspecular reflection
[AD-A105225] N82-12893

ULTRAVIOLET ABSORPTION
Higher plant acclimation to solar ultraviolet-B radiation N82-12737
The extinction by small aluminum particles from the far infrared to the vacuum ultraviolet N82-12960

ULTRAVIOLET ASTRONOMY
Integrated fluxes for emission lines in the ultraviolet spectra of several planetaries
[NASA-CR-164986] N82-13022

ULTRAVIOLET RADIATION
Higher plant acclimation to solar ultraviolet-B radiation N82-12737

ULTRAVIOLET SPECTRA
Integrated fluxes for emission lines in the ultraviolet spectra of several planetaries
[NASA-CR-164986] N82-13022

UNDERGROUND EXPLOSIONS
Calculations on seismic coupling of underground explosions in salt
[DE81-030633] N82-12706

UNDERGROUND STORAGE
Hydrologic studies support, INTERCOMP code conversion
[DE81-030318] N82-12515
Low-level radioactive waste: An introductory overview
[DE81-026334] N82-12924

UNDERGROUND STRUCTURES
Monitor for detecting nuclear waste leakage in a subsurface repository
[DE81-026429] N82-12927

UNDERWATER ACOUSTICS
Development and applications of computer-assisted acoustic holography N82-12418
Regional dependence of very low-frequency sound attenuation in the deep sound channel: Correlation with internal wave measurements
[AD-A105061] N82-12892

UNDERWATER EXPLOSIONS
A non-linear model for low velocity underwater explosions N82-12235
The response of two fluid-coupled plates to an incident pressure pulse
[AD-A104801] N82-12475

UNITED KINGDOM
Policy and support for research in marine life sciences N82-12651

UNITED STATES OF AMERICA
Geological features of southwestern North America N82-12495
Earthquakes in the United States, July - September 1979
[USGS-CIRC-836-C] N82-12690
Earthquakes in the United States, January - March 1979
[CIRC-836-A] N82-12691

UNIVERSE
Topics in the evolution of cosmological perturbations N82-13029
The Universe: Past and present reflections --- big bang theory
[PREPRINT-70] N82-13032

UNSTEADY FLOW
Unsteady boundary layer separation N82-12029
A pulse-forming network for particle path visualization --- at Ames Aeromechanics Water Tunnel Facility
[NASA-TM-81311] N82-12036
Self-induced pulsating liquid flow in a hydraulic system
[MPIS-15/1980] N82-12414

UPGRADING
Upgrading the intense neutron source high voltage power supply
[DE81-028970] N82-12364
Deferring updates in a relational data base system
[P-6634] N82-12793

UPPER ATMOSPHERE
Orbital environment dynamics N82-12123
Microwave limb sounder --- measuring trace gases in the upper atmosphere
[NASA-CASE-NPO-14544-1] N82-12685

UPSTREAM
Interaction of upstream flow distortions with high Mach number cascades
[NASA-TM-82759] N82-12043

URANIUM
Hydrogeochemical and stream sediment reconnaissance basic data for Ruby Quadrangle, Alaska
[DE81-029982] N82-12512
Hydrogeochemical and stream sediment reconnaissance basic data for Wainwright Quadrangle, Alaska
[DE81-028670] N82-12528
Hydrogeochemical and stream sediment reconnaissance basic data for Point Lay Quadrangle, Alaska
[DE81-028669] N82-12529
Hydrogeochemical and stream sediment reconnaissance basic data for Harrison Bay Quadrangle, Alaska
[DE81-028352] N82-12530
Hydrogeochemical and stream sediment reconnaissance basic data for Teshekpuk Quadrangle, Alaska
[DE81-027408] N82-12531

URBAN RESEARCH
Evaluation of landfill gas as an energy source --- feasibility of methane recovery from landfills
[DE82-000116] N82-12584

USER MANUALS (COMPUTER PROGRAMS)
User's guide to the hydrogen monitor --- high temperaure gas cooled reactors
[DE81-032023] N82-12425

User's guide to HELIOS: A computer program for modeling the optical behavior of reflecting solar concentrators. Part 1: Introduction and code input [DE81-031920] N82-12616

User manual for SILVA: A computer code for estimating effects of pollution on the growth and succession of Western coniferous forests [DE82-000134] N82-12664

Oceanographic technology information service: User's guide [AD-A10[illegible]870] N82-12736

Transonic airfoil design of full potential flow. 2: Development of the FORTRAN code [NAL-TR-673] N82-12814

PAPIN: A FORTRAN-4 program to calculate cross section probability tables, Bondarenko and transmission self-shielding factors for fertile isotopes in the unresolved resonance region [DE81-030436] N82-12903

USER REQUIREMENTS

Transportation systems evaluation methodology development and applications, phase 3 [NASA-CR-164999] N82-12051

BENORSY: A formalized instrument for the user oriented revision of dp-systems [BMFT-FB-DV-81-001] N82-12804

UTAH

Meteorological and climatological investigation: Review of January - June 1980 investigative report, volume 1 [DE81-030741] N82-12729

Meteorological and climatological investigation: Review of January - June 1980 investigative period, volume 2 [DE81-030742] N82-12730

Meteorological and climatological investigation: Review of January - June 1980 investigative period [DE81-030740] N82-12731

UTILITIES

Passive solar technical planning study [EPRI-EM-1591] N82-12578

UTILIZATION

Advantages and limitations of various materials used in the construction of modules --- aircraft construction [SNIAS-812-551-103] N82-12072

V

VACUUM APPARATUS

X-ray emission of high voltage vacuum devices N82-12348

VACUUM EFFECTS

Instanton effects in the equation of state for dense neutron star matter [HU-TFT-79-19] N82-13023

VACUUM PUMPS

Novel limiter pump topologies [DE81-030029] N82-12947

VANADIUM ALLOYS

Thermotransport of hydrogen and deuterium in vanadium, niobium and tantalum alloys N82-12208

VAPOR PHASE EPITAXY

Research and development on new technologies for the preparation of III-V semiconductor materials and on methods for evaluation of the quality of these materials. Project Ga(AsP) expitaxial layers and substrates for them [BMFT-FB-T-81-020] N82-12982

VAPOR PHASES

Application of ion cyclotron resonance spectroscopy, photoionization mass spectrometry and photoelectron spectroscopy to study the properties and reactions of ions in gases [DE81-030296] N82-12189

VAPORIZERS

Retrofit and acceptance test of 30-cm ion thrusters [NASA-CR-165259] N82-12133

VAPORS

A vapour cycle cabin cooling system for the Sea King MK.50 helicopter [AD-A105211] N82-12069

VARIABILITY

Data base for the analysis of compositional characteristics of coal seams and macerals [DE81-031977] N82-12522

Adverse weather and night capability: A call for action. Volume 2: Appendix, data base for selected important military locations [AD-A104991] N82-12726

VARIANCE (STATISTICS)

Natural exponential families with quadratic variance functions [P-6637] N82-12844

VARIATIONS

Instanton effects in the equation of state for dense neutron star matter [HU-TFT-79-19] N82-13023

VECTOR ANALYSIS

On the flow measurements and velocity vector analysis using five-hole pitot tubes [NAL-TR-668] N82-12385

Optimal integer and fractional covers: A sharp bound on their ratio [AD-A104829] N82-12886

VEGETATION

Vegetation patterns N82-12500

VELOCITY DISTRIBUTION

The effect of a translating high aspect ratio particle in a plane slider bearing N82-12440

A two-dimensional study of the maximum power that can be obtained from a wind turbine in a wind shear layer [FFA-134] N82-12537

Velocity-space synthesis of ISEE-1 measurements of the three dimensional electron distribution function [NASA-TM-83838] N82-12813

VELOCITY MEASUREMENT

Wake boundary layer interaction in turbomachinery N82-12028

The use of groundspeed, in a wind shear and the flight evaluation of a radar-altimeter-based system for the measurement of groundspeed [AD-A104758] N82-12060

On the flow measurements and velocity vector analysis using five-hole pitot tubes [NAL-TR-668] N82-12385

VENTILATION

A vapour cycle cabin cooling system for the Sea King MK.50 helicopter [AD-A105211] N82-12069

Energy efficiency buildings program [DE81-026050] N82-12276

Midway house-tightening project: A study of indoor air quality --- concentrations of radon formaldehyde, and nitrogen dioxide [DE81-030686] N82-12277

VERTICAL DISTRIBUTION

German-Argentine experiment: Vertical-rotor wind engine N82-12648

Reduction of photosynthetically active radiation under extreme stratospheric aerosol loads [DE81-030506] N82-12705

VERTICAL MOTION SIMULATORS

Simulator certification methods and the vertical motion simulator [NASA-CR-166252] N82-12082

VIBRATION

Qualification vibration test report for SD 802 materials experiment [AD-A105321] N82-12132

Research activities report of the Institute of Sound and Vibration Research N82-12894

VIBRATION ISOLATORS

Study and development of face-contact, bellows mechanical seal for liquid hydrogen turbopump [NAL-TR-653] N82-12443

VIBRATION TESTS

Vibration test procedures for accessory angle drive gearboxes on Atar 09C engines --- turbojet engines [AD-A105269] N82-12076

VIBRATIONAL STRESS

Vibration of cylindrical shells and panels of oval cross-section N82-12466

Wave induced vibrations of continuous floating structures N82-12467

VIDEO DISKS

Video discs: Their application to information storage and retrieval [NRCD-12] N82-13006

VIRGIN ISLANDS

SAGE measurements of the stratospheric aerosol dispersion and loading from the Soufriere Volcano [NASA-TP-1922] N82-12687

VIRTUAL PROPERTIES

An investigation of the status of bone conduction audiometer calibration in the National Health Service [NPL-AC-101] N82-12769

Design and construction of a virtual machine resource binding language N82-12812

VISCOPLASTICITY

Viscoplastic and creep crack growth analysis by the finite element method [AD-A105120] N82-12476

VISCOUS FLOW

The numerical solution of incompressible turbulent flow over airfoils N82-12030

Prediction of the incompressible flow over a rearward-facing step N82-12376

Computation of general two-dimensional steady viscous flows [AD-A105232] N82-12389

In-duct viscous flow pressure distribution on a body with boundary layer control [AD-A105396] N82-12394

VISIBILITY

Adverse weather and night capability: A call for action. Volume 2: Appendix, data base for selected important military locations [AD-A104991] N82-12726

Conspicuity of observation posts at the air weapon firing ranges on the Vliehors and the Noordvaarder [IZF-1979-33-E] N82-12774

VISUAL CONTROL

The effect of visual information on manual approach and landing [NLR-MP-80019-U] N82-12064

VISUAL DISCRIMINATION

The efficiency of detecting tribar patterns modulated in random dot density [IZF-1980-25] N82-12779

VISUAL OBSERVATION

Desert sand seas N82-12493

Global Tectonics: Some Geologic analyses of observations and photographs from Skylab N82-12494

Geological features of southwestern North America N82-12495

Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Fernandian Caldera, Galapagos Islands, Ecuador N82-12496

Snow-mapping experiment N82-12498

Visual observations of the ocean N82-12502

An assessment of the potential contributions to oceanography from Skylab visual observations and handheld-camera photographs N82-12503

Visual observations of floating ice from Skylab N82-12504

Conspicuity of observation posts at the air weapon firing ranges on the Vliehors and the Noordvaarder [IZF-1979-33-E] N82-12774

VISUAL TASKS

The efficiency of detecting tribar patterns modulated in random dot density [IZF-1980-25] N82-12779

VOCODERS

Phonematic recognition by linear prediction: Experiment [ENST-C-81001] N82-12323

VOICE COMMUNICATION

Columbus, Ohio, Voice response system demonstration and evaluation [AD-A104750] N82-12304

New approach to speech digitization combining time-domain harmonic scaling and adaptive residual coding [AD-A105383] N82-12311

Automatic recognition of cooperative speakers [BMFT-FB-DV-80-009] N82-12319

VOIDS

The stability and soldering void effect of large superconductor N82-12340

A critical void growth failure criterion developed for dynamic and static loading conditions N82-12469

VOLCANOES

Skylab 4 observations of Volcanoes. Part A: Volcanoes and volcanic landforms. Part B: Summit eruption of Fernandian Caldera, Galapagos Islands, Ecuador N82-12496

Quantitative analysis of atmospheric pollution phenomena N82-12505

SAGE measurements of the stratospheric aerosol dispersion and loading from the Soufriere Volcano
[NASA-TP-1922] N82-12687

Mount St. Helens volcanic-ash fall in the Bull Run watershed, Oregon, March - June 1980
[USGS-CIRC-850-A] N82-12688

Effects of volcanism on the glaciers of Mount St. Helens
[USGS-CIRC-850-D] N82-12689

VOLCANOLOGY

Mount St. Helens volcanic-ash fall in the Bull Run watershed, Oregon, March - June 1980
[USGS-CIRC-850-A] N82-12688

Fundamental studies in geodynamics
[NASA-CR-164990] N82-12696

VOLTAGE CONVERTERS (DC TO DC)

High-frequency high-voltage high-power DC-to-DC converters N82-12347

VOLTERRA EQUATIONS

Modified multilag methods for Volterra functional equations
[MC-NW-108/01] N82-12861

VORTEX BREAKDOWN

On Vortex breakdown and instability
[AD-A104980] N82-12048

VORTEX FILAMENTS

A vortex-filament and core model for wings with edge vortex separation
[NASA-CR-164980] N82-12039

VORTEX RINGS

An experimental study of a turbulent vortex ring N82-12032

Ring eddy flow metamorphosis as a basis for implosion of partial vacuums, Schwenk's drop picture method and cutting by means of a water jet
[MPIS-13/1980] N82-12401

VORTEX STREETS

Mesoscale wake clouds in Skylab photographs N82-12506

Mesoscale cloud features observed from Skylab N82-12509

VORTICES

The coherent structure of turbulent mixing layers. 1: Similarity of the primary vortex strucuture. 2: Secondary streamwise vortex structure N82-12033

A vortex-filament and core model for wings with edge vortex separation
[NASA-CR-164980] N82-12039

Experimental and analytical studies of a model helicopter rotor in hover
[NASA-TM-81232] N82-12042

Self-sustained oscillations of a mixing layer. Edge system N82-12374

A study of time evolution of continuous vortex loops in a homogeneous or stratified fluid N82-12381

On the manipulation of spreading rates of forced mixing layers
[AD-A105236] N82-12390

Calculation of transient and quasi-stationary flows in high temperature reactors with spherical nuclear fuel elements, using the vortex flow method
[IKE-4-98] N82-12928

W

WAFERS

Silicon quality: A consideration for VHSI circuit development
[AD-A105198] N82-12355

New photolithographic method for small dimension. Direct step and repeat technique (silicon repeater)
[BMFT-FB-T-81-019] N82-12426

WAKES

Wake boundary layer interaction in turbomachinery N82-12028

A study of time evolution of continuous vortex loops in a homogeneous or stratified fluid N82-12381

Mesoscale wake clouds in Skylab photographs N82-12506

WASTE DISPOSAL

Hydrologic studies support, INTERCOMP code conversion
[DE81-030318] N82-12515

Solid waste disposal practices: Open dumps not identified. States face funding problems
[CED-81-131] N82-12653

Method and system for nuclear waste disposal — control valves for encapsulating wastes
[NASA-CASE-NPO-15454-1] N82-12916

Is spent fuel or waste from reprocessed spent fuel simpler to dispose of?
[EMD-81-78] N82-12917

Survey of matrix materials for solidified radioactive high-level waste
[DE82-000708] N82-12922

Low-level radioactive waste: An introductory overview
[DE81-026334] N82-12924

An approach to the management of hazardous materials
[AD-A104869] N82-12987

WASTE ENERGY UTILIZATION

Air circuit with heating pump
[BMFT-FB-T-80-188] N82-12404

High-temperature counter-flow recuperator
[DE81-031923] N82-12424

Utilization of waste heat from major transformer substations. Volume 1: Generic study
[DE81-904212] N82-12593

Utilization of waste heat from major transformer substations. Volume 2: Site-specific study
[DE81-904236] N82-12594

Design, construction, and operation of a full scale experimental anaerobic fermentation facility
[DE81-029028] N82-12605

Conversion of municipal solid waste to energy, Jacksonville, Florida, phase 1
[DE82-000806] N82-12613

Waste-to-energy Systems Institutional Barriers Assessment Workshop
[DE82-000098] N82-12621

WASTE TREATMENT

Thermal processing of used catalysts
[BMFT-FB-T-80-189] N82-12205

Microbial methane fermentation kinetics for toxicant exposure
[AD-A104868] N82-12243

State of the art of methane gas enhancement in landfills
[DE82-000155] N82-12253

Evaluation of landfill gas as an energy source — feasibility of methane recovery from landfills
[DE82-000116] N82-12584

Waste-to-energy Systems Institutional Barriers Assessment Workshop
[DE82-000098] N82-12621

Treatment of biomass-gasification wastewaters using liquid-liquid extraction
[DE82-000711] N82-12662

Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic-fuels production
[DE81-030671] N82-12673

Environmental control technology for coal cleaning wastes
[DE81-025331] N82-12676

Process for the denitrification of high-level radioactive liquid wastes
[DE81-026875] N82-12925

Nuclear waste incineration technology status
[DE81-025751] N82-12926

Wet air oxidation of waste water
[BMFT-FB-T-80-132] N82-13016

WASTE UTILIZATION

Solvent extraction studies using high-molecular-weight amines
[DE81-030061] N82-12191

The severity of institutional barriers affecting energy-from-municipal-waste technologies
[DE82-000133] N82-12583

Energy recovery from municipal solid waste and sewage sludge using multi-solid fluidized bed combustion technology
[DE82-001142] N82-12596

Technology assessment of solar energy systems: Potential soil erosion effects of harvesting crop residues for energy production
[DE82-000149] N82-12606

Interactive model to assess economics of anaerobic digestion of the farm
[DE82-000452] N82-12620

WASTE WATER

Kinetics of wet oxidation of biological sludges from coal-conversion wastewater treatment
[DE82-000525] N82-12674

WATER

Nonlinear interaction of sound waves in water: Experiments with parametric arrays
[PHL-1979-44] N82-12897

WATER BALANCE

Skylab water balance analysis
[NASA-CR-167461] N82-12753

WATER HEATING

Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 2: Domestic hot water systems
[DE82-900207] N82-12279

Fuel savings in hot water heating plants by application of heat pumps operated with natural gas (natural gas heat pump). Project: gas engine
[BMFT-FB-T-80-125] N82-12641

WATER POLLUTION

Solid waste disposal practices: Open dumps not identified. States face funding problems
[CED-81-131] N82-12653

A statistical evaluation of OHMSETT testing
[PB81-226128] N82-12679

Assessment of water supply contamination due to underground coal gasification
[PB81-209215] N82-12680

Hydrocarbon composition of sediments, water, and fauna in selected areas of the Gulf of Mexico and Southern California marine environment N82-12732

WATER QUALITY

Water resources data for New York, water year 1980. Volume 1: Eastern New York excluding Long Island
[PB81-227308] N82-12534

Water resources data for New York, water year 1980. Volume 3: Western New York
[PB81-227316] N82-12535

Development of a marine monitoring program in California N82-12649

Solid waste disposal practices: Open dumps not identified. States face funding problems
[CED-81-131] N82-12653

Calibration of a turbidity meter for making estimates of total suspended solids concentrations and beam attenuation coefficients in field experiments
[NASA-TM-81873] N82-12655

Assessment of water supply contamination due to underground coal gasification
[PB81-209215] N82-12680

Mount St. Helens volcanic-ash fall in the Bull Run wateshed, Oregon, March - June 1980
[USGS-CIRC-850-A] N82-12688

Hydrocarbon composition of sediments, water, and fauna in selected areas of the Gulf of Mexico and Southern California marine environment N82-12732

Method and apparatus for detecting coliform organisms
[NASA-CASE-ARC-11322-1] N82-12739

WATER TABLES

Water resources data for New York, water year 1980. Volume 1: Eastern New York excluding Long Island
[PB81-227308] N82-12534

Water resources data for New York, water year 1980. Volume 3: Western New York
[PB81-227316] N82-12535

WATER TREATMENT

Removal of nitrates from ground waters by reverse osmosis
[BMFT-FB-T-80-155] N82-12203

Treatment of biomass-gasification wastewaters using liquid-liquid extraction
[DE82-000711] N82-12662

Wet air oxidation of waste water
[BMFT-FB-T-80-132] N82-13016

WATER TUNNEL TESTS

A pulse-forming netwprk for particle path visualization — at Ames Aeromechanics Water Tunnel Facility
[NASA-TM-81311] N82-12036

WATER VAPOR

The kinetics of the reverse Deacon reaction N82-12152

WATER WAVES

Advective effects in the numerical simulation of long period, large amplitude wave behavior
[AD-A105231] N82-12391

Wave induced vibrations of continuous floating structures N82-12467

Standarized wave and wind environments for NATO operational areas
[AD-A105414] N82-12725

WATER WHEELS

Modular hydro dam approach to the economic development of ultra low-head hydropower
[DE81-027817] N82-12635

WATERSHEDS
Mount St. Helens volcanic-ash fall in the Bull Run watershed, Oregon, March - June 1980
[USGS-CIRC-850-A] N82-12868
WAVE DISPERSION
Long ocean waves on linearly varying bottom topographies N82-12733
WAVE INTERACTION
Morphology of stratospheric planetary waves
[AD-A105006] N82-12704
Interaction of ion-acoustic solitons in multi-dimensional space, 2
[IPPJ-535] N82-12941
WAVE PROPAGATION
A one-dimensional plane wave propagation code for layered rate-dependent hysteretic materials
[AD-A105241] N82-12274
The gravity wave in a liquid with a surface film, in the presence of an applied electric field
[REPT-80-2] N82-12408
Propagation on finite disturbances in the boundary layer
[MPIS-3/1981] N82-12415
Proposed experimental studies for assessing ionospheric perturbations on SPS uplink pilot beam signal N82-12543
Ionospheric effects in active retrodirective array and mitigating system design N82-12551
Investigations of the reflection, transmission, and conversion of ultrasonic waves N82-12886
Simple-power-balance model for microwave heating in EBT
[DE81-030428] N82-12953
On the nature of the cosmic ray positron spectrum
[NASA-TM-83834] N82-13041
WAVE REFLECTION
Investigations of the reflection, transmission, and conversion of ultrasonic waves N82-12886
Some aspects of ultrasonic nonspecular reflection
[AD-A105225] N82-12893
WAVEFORMS
Voltage test facility for defence standard 61-5
[NGTE-M-80112(L)] N82-12370
The uniqueness of phase retrieval from intensity measurements
[AD-A105168] N82-12934
WAVEGUIDE ANTENNAS
SPS antenna element evaluation N82-12555
Evaluation of thick wall wave guide element N82-12557
Method for precision forming of low-cost, thin-walled slotted waveguide arrays for the SPS N82-12558
WAVEGUIDES
Antenna
[AD-A106521] N82-12312
Coherent and incoherent radiation from free electron lasers with an axial guide field
[AD-A104806] N82-12434
WAVELENGTHS
Advective effects in the numerical simulation of long period, large amplitude wave behavior
[AD-A105231] N82-12391
WEAK INTERACTIONS (FIELD THEORY)
Fundamental tests and measures of the structure of matter at short distances
[DE81-030644] N82-12978
WEAPON SYSTEMS
W76 elastomers/propellant compatibility
[DE81-031933] N82-12256
WEAR TESTS
Friction and wear behavior of Ti-6Al-4V and a Ni base alloy (Hastelloy C-276) N82-12439
Facing on stamping dies — testing wear resistance
[CETIM-1.3K.26.2] N82-12460
WEATHER FORECASTING
Estimation of the cumulative attenuation distribution due to rain on a path exceeding 1 km, given the cumulative distribution due to rain on a path of 1km — 94 GHz
[PHL-1980-13] N82-12326
Some aspects of tropical storm structure revealed by handheld-camera photographs from space N82-12507
Evaluation of a method for short-range forecasting of evaporation duct heights
[AD-A104592] N82-12724
Terminal forecast reference notebook, detachment 12, 15th weather squadron for Selfridge Air National Guard Base, Michigan
[AD-A105083] N82-12727
Terminal forecast reference notebook for Scott Air Force Base, Illinois
[AD-A105084] N82-12728
WEIGHT INDICATORS
Evaluation and wind tunnel tests of the 4,000 lb (normal-force) pitch/yaw and roll dynamic stability balance systems for measuring direct, cross, and cross-coupling derivatives
[AD-A105122] N82-12047
WEIGHTLESSNESS
Dynamics of superfluid helium in zero gravity — Spacelab 2 investigation N82-12111
Combustion experiments in space N82-12115
WEIGHTLESSNESS SIMULATION
Overview N82-12716
WELDED STRUCTURES
Feasibility study on the fabrication of longitudinally welded heat exchanger tubes for sea water desalination plants on a factory ship
[BMFT-FB-M-80-004] N82-12453
The relation between welding parameters for a beam section and its buckling resistance
[CRIF-MT-143] N82-12454
WELDING
Space nuclear safety and fuels program N82-12921
WELLS
Designing process wells for an underground coal-gasification environment
[DE81-028434] N82-12264
Geothermal reservoir assessment: Northern basin and range province Stillwater prospect, Churchill County, Nevada
[DE82-000529] N82-12516
WETTING
Tribology experiment — journal bearings and liquid lubricants N82-12117
WIND DIRECTION
Standarized wave and wind environments for NATO operational areas
[AD-A105414] N82-12725
WIND PROFILES
Advanced Shuttle Simulation Turbulence Tapes (SSTT) users guide
[NASA-CR-161890] N82-12106
WIND SHEAR
The use of groundspeed, in a wind shear and the flight evaluation of a radar-altimeter-based system for the measurement of groundspeed
[AD-A104758] N82-12060
A two-dimensional study of the maximum power that can be obtained from a wind turbine in a wind shear layer
[FFA-134] N82-12537
WIND TUNNEL APPARATUS
Evaluation and wind tunnel tests of the 4,000 lb (normal-force) pitch/yaw and roll dynamic stability balance systems for measuring direct, cross, and cross-coupling derivatives
[AD-A105122] N82-12047
Construction and performance of NAL two-dimensional transonic wind tunnel
[NAL-TR-647] N82-12083
A look inside the Langley 16-foot transonic tunnel: User's guide
[NASA-TM-83186] N82-12085
WIND TUNNEL CALIBRATION
Description and calibration of the Langley unitary plan wind tunnel
[NASA-TP-1905] N82-12035
Construction and performance of NAL two-dimensional transonic wind tunnel
[NAL-TR-647] N82-12083
WIND TUNNEL MODELS
An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on model scale effects
[AD-A104905] N82-12392
WIND TUNNEL TESTS
Aerodynamic measurements concerned with a turret model
[NASA-CR-166264] N82-12034
Aeroelasticity matters: Some reflections on two decades of testing in the NASA Langley transonic dynamics tunnel
[NASA-TM-83210] N82-12041
Construction and performance of NAL two-dimensional transonic wind tunnel
[NAL-TR-647] N82-12083
WIND VELOCITY
A two-dimensional study of the maximum power that can be obtained from a wind turbine in a wind shear layer
[FFA-134] N82-12537
Standarized wave and wind environments for NATO operational areas
[AD-A105414] N82-12725
WIND VELOCITY MEASUREMENT
A radionuclide counting technique for measuring wind velocity — drag force anemometers
[NASA-TM-83202] N82-12419
WINDOWS (APERTURES)
Comparison of residential window distributions and effects of mass and insulation
[DE81-027936] N82-12283
The window and its heat balance considering solar radiation and additional insulation measures
[BMFT-FB-T-80-070] N82-12402
WINDPOWER UTILIZATION
Security assessment of power systems including energy storage and with the integration of wind energy
[DE81-030166] N82-12590
WINDPOWERED GENERATORS
A two-dimensional study of the maximum power that can be obtained from a wind turbine in a wind shear layer
[FFA-134] N82-12537
Vertical-axis wind-turbine control strategy
[DE81-031932] N82-12591
West Europe report: Science and technology, no. 72 — composite materials and energy technology
[JPRS-78876] N82-12645
German-Argentine experiment: Vertical-rotor wind engine N82-12648
WING LOADING
Effect of fighter attack spectrum on composite fatigue life
[AD-A105034] N82-12143
WING OSCILLATIONS
Aeroelasticity matters: Some reflections on two decades of testing in the NASA Langley transonic dynamics tunnel
[NASA-TM-83210] N82-12041
WING TIPS
Wind-tunnel investigation of the side-force of rectangular winglets on the tip of a rectangular wing
[NAL-TR-669] N82-12037
WINGLETS
Wind-tunnel investigation of the side-force of rectangular winglets on the tip of a rectangular wing
[NAL-TR-669] N82-12037
WIRING
Coordinate measurement by current division: A simple system for multichannel detectors
[DE81-030176] N82-12423
WISCONSIN
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] N82-12604
WOOD
MASEC industrial fuel-wood program
[DE82-000461] N82-12595
Technology assessment of solar energy systems: Residential use of fuelwood in the Pacific Northwest
[DE82-000046] N82-12603
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] N82-12604
WORDS (LANGUAGE)
Effect of reference set selection on speaker dependent speech recognition: Frame compression in isolated word recognition
[AD-A104794] N82-12307
WORK FUNCTIONS
Hydrogen and hydrocarbon absorption and desorption in sensors with transition metal gates on MOS capacitors N82-12331
WRINKLING
Buckling of a thin initially wrinkled rectangular plate
[DE81-029963] N82-12479

X

X RAY APPARATUS
Automated X-ray orientation for quartz crystal resonators
[AD-A104945] N82-12977
X RAY ASTRONOMY
X-ray observations of stellar coronae N82-13038
X RAY IMAGERY
Radiographic applications of spatial frequency multiplexing
[NASA-CR-166748] N82-12930
X-ray optics
[AD-A105220] N82-12935
X-ray imaging observations of the radio galaxies Cen A, Vir A, and 3C273 N82-13021
X RAY IRRADIATION
Chemical protection of cells in culture and mice against X-irradiation
[MBL-1979-2] N82-12743
X RAY SCATTERING
X-ray scattering investigation of microalloying and defect structure in ion implanted copper
[AD-A105442] N82-12967
X RAY SOURCES
X-ray imaging observations of the radio galaxies Cen A, Vir A, and 3C273 N82-13021
X RAY STRESS MEASUREMENT
IN situ goniometer — for industrial residual stress measurement
[CETIM-5.41.22.0-PT-1] N82-12485
X RAYS
X-ray emission of high voltage vacuum devices
N82-12348
Data reduction and analysis for the graphite crystal X-ray spectrometer and polarimeter experiment flown aboard OSO-8 spacecraft
[NASA-CR-166749] N82-13030
Matter accreting neutron stars
[NASA-TM-83835] N82-13031

Y

YAG LASERS
Laser systems for the Combustion Research Facility: Orion
[DE81-030989] N82-12437
YAW
Yawsonde tests of 2.75-inch Mk66 mod 1rocket
[AD-A104904] N82-12101
YIELD STRENGTH
The relation between welding parameters for a beam section and its buckling resistance
[CRIF-MT-143] N82-12454

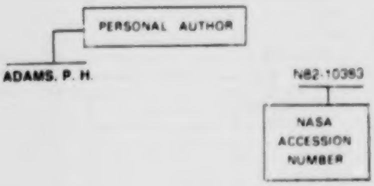
Z

ZETA PINCH
Effects of preionization level on a stabilized Z-pinch
[FUPH-R-164] N82-12951
ZINC SULFIDES
Piezoelectric ZnS film on silicon
[AD-A105161] N82-12359
ZIPPERS
Zipper rear closure endurance testing
[AD-A104732] N82-12765

PERSONAL AUTHOR INDEX

SCIENTIFIC AND TECHNICAL AEROSPACE REPORTS VOLUME 20 NUMBER 3

Typical Personal Author Index Listing



Listings in this Index are arranged alphabetically by personal author The NASA accession number denotes the number by which the citation is identified

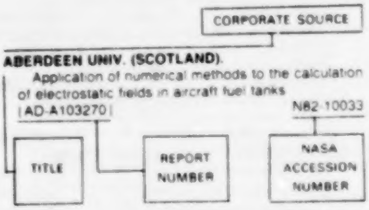
CORPORATE SOURCE INDEX

SCIENTIFIC AND TECHNICAL AEROSPACE REPORTS VOLUME 20 NUMBER 3

Typical Corporate Source Index Listing



ABERDEEN UNIV. (SCOTLAND).
Application of numerical methods to the calculation of electrostatic fields in aircraft fuel tanks
[AD-A103270] N82-10033

Listings in this index are arranged alphabetically by corporate source. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g. NASA report, translation, NASA contractor report). The NASA accession number denotes the number by which the citation is identified. The titles are arranged under each corporate source in ascending accession number order.

A

ACRES AMERICAN, INC., BUFFALO, N.Y.

Innovative equipment for small-scale hydro developments
[DE81-027820] N82-12634

ADVANCED RESEARCH AND APPLICATIONS CORP., SUNNYVALE, CALIF.

Silicon quality: A consideration for VHSI circuit development
[AD-A105198] N82-12355

AEG-TELEFUNKEN, HEILBRONN (WEST GERMANY).

Silicon transport epitaxy
[BMFT-FB-T-80-165] N82-12980

AERONAUTICAL RESEARCH INST. OF SWEDEN, STOCKHOLM.

A two-dimensional study of the maximum power that can be obtained from a wind turbine in a wind shear layer
[FFA-134] N82-12537

AERONAUTICAL RESEARCH LABS., MELBOURNE (AUSTRALIA).

Flight trail of the Aircraft Fatigue Data Analysis System (AFDAS) Mk 2 prototype
[AD-A105270] N82-12066

A vapour cycle cabin cooling system for the Sea King MK.50 helicopter
[AD-A105211] N82-12069

Vibration test procedures for accessory angle drive gearboxes on Atar 09C engines
[AD-A105269] N82-12076

AEROSPACE CORP., EL SEGUNDO, CALIF.

Qualification vibration test report for SD 802 materials experiment
[AD-A105321] N82-12132

Project for reliability fleet testing of alcohol/gasoline blends
[DE82-000004] N82-12250

Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 1: Energy-conserving design for residential structures
[DE82-900206] N82-12278

Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 2: Domestic hot water systems
[DE82-900207] N82-12279

Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 3: Customer load management systems
[DE82-900208] N82-12280

Scaling laws for pulsed chain-reaction chemical lasers
[AD-A104752] N82-12436

Voltage losses and reconditioning of NiCd cells: Behavior during cycling
[AD-A105418] N82-12575

Impedance and mass transport kinetics of nickel cadmium cells
[AD-A105320] N82-12576

Pitch-angle diffusion in canonical coordinates: A theoretical formulation
[AD-A105392] N82-12701

AEROSPACE CORP., GERMANTOWN, MD.

Energy technologies and the environment. Environmental information handbook
[DE81-029809] N82-12680

Technology characterizations: Environmental information handbook, second edition
[DE81-029993] N82-12671

AEROSPACE CORP., LOS ANGELES, CALIF.

Evaluation of active and passive near-millimeter-wave radiometric imaging techniques for detection of concealed objects
[DE81-031938] N82-12316

AIR FORCE FLIGHT TEST CENTER, EDWARDS AFB, CALIF.

AFFTC standard airspeed calibration procedures
[AD-A104830] N82-12074

AIR FORCE INST. OF TECH., WRIGHT-PATTERSON AFB, OHIO.

The numerical solution of incompressible turbulent flow over airfoils N82-12030

Multiple arrested synthetic aperture radar
N82-12295

An exploratory study of costs to operate Government-Owned, Contractor-Operated (GOCO) facilities
[AD-A104854] N82-12986

AIR FORCE WRIGHT AERONAUTICAL LABS., WRIGHT-PATTERSON AFB, OHIO.

A source-doublet approach to modeling triple ejector rack store configurations and force calculations
[AD-A105427] N82-12045

Acetylene terminated phenylene thermoset systems
[AD-A105394] N82-12176

Viscoplastic and creep crack growth analysis by the finite element method
[AD-A105120] N82-12476

AIR RESOURCES LAB., LAS VEGAS, NEV.

Quantitative analysis of atmospheric pollution phenomena N82-12505

ALPHA GLASS, INC., EL SEGUNDO, CALIF.

Cutting tool coatings program
[DE81-026289] N82-12449

AMERICAN UNIV., WASHINGTON, D. C.

Report on Skylab 4 African drought and arid land experiment N82-12501

AMES LAB., IOWA.

Inductively coupled plasma as an ion source for the determination of trace elements in solutions by mass spectrometry
[DE81-030744] N82-12192

Mechanical properties and hydrogen embrittlement of scandium
[DE81-030745] N82-12221

Superconductivity in Th-Nb composites
[DE81-030746] N82-12363

ANALYTIC SCIENCES CORP., READING, MASS.

Military geodesy and geospace science unit four
[AD-A105073] N82-12702

Military geodesy and geospace science, unit two
[AD-A105071] N82-12703

APTECH ENGINEERING SERVICES, INC., PALO ALTO, CALIF.

Investigation and research of specific combustion-turbine and combined-cycle field problems
[DE81-904231] N82-12592

ARGONNE NATIONAL LAB., ILL.

Simple code for chemical equilibrium and thermodynamic properties for use with GPSAP
[ANL/MHD-81-11] N82-12183

State of the art of methane gas enhancement in landfills
[DE82-000155] N82-12253

Ethanol production via fungal decomposition and fermentation of biomass, phase 2
[DE82-000104] N82-12256

Ethanol production via fungal decomposition and fermentation of biomass
[DE82-000103] N82-12257

Density-measurement studies at the BI-GAS pilot plant
[DE82-000910] N82-12262

Buckling of a thin initially wrinkled rectangular plate
[DE81-029963] N82-12479

The severity of institutional barriers affecting energy-from-municipal-waste technologies
[DE82-000133] N82-12583

Assessment of the potential of coal-fueled heat engines in total and integrated energy systems
[DE82-000169] N82-12587

Technology assessment of solar energy systems: Potential soil erosion effects of harvesting crop residues for energy production
[DE82-000149] N82-12606

Waste-to-energy Systems Institutional Barriers Assessment Workshop
[DE82-000098] N82-12621

Environmental data for sites in the National Solar Data Network
[DE82-000071] N82-12707

ARIZONA UNIV., TUCSON.

Subcritical and supercritical airfoils for given pressure distribution N82-12031

Fuel nitrogen conversion during fuel rich combustion of pulverized coal and char N82-12156

Modular implementation of a digital hardware design automation system N82-12333

Heat transfer in a fixed bed and mass transfer in a counter-current moving bed N82-12373

Guidebook for solar process-heat applications
[DE81-027977] N82-12598

Hydrostatic calculations of axisymmetric flow and its stability for the AGCE model N82-12718

Oxygen toxicity and lung collagenous protein
[AD-A104702] N82-12756

Solution of nonlinear structural problems using array processors
[AD-A104987] N82-12800

Time-of-flight spectroscopy of molecular structure, collision processes and gas-surface interactions
[AD-A105438] N82-12898

Application and description of the interacting Boson Model N82-12914

The extinction by small aluminum particles from the far infrared to the vacuum ultraviolet N82-12960

ARMY ARMAMENT RESEARCH AND DEVELOPMENT COMMAND, DOVER, N. J.

CARS spectroscopy of gun propellant flames
[AD-A105224] N82-12177

ARMY ARMAMENT RESEARCH AND DEVELOPMENT COMMAND, WATERVLIET, N. Y.
Elastic-plastic thick-walled tubes subjected to internal pressure and temperature gradient
[AD-A105243] N82-12477

ARMY AVIATION RESEARCH AND DEVELOPMENT COMMAND, MOFFETT FIELD, CALIF.
Performance and loads data from a wind tunnel test of a full-scale, coaxial, hingeless rotor helicopter
[NASA-TM-81329] N82-12040
Experimental and analytical studies of a model helicopter rotor in hover
[NASA-TM-81232] N82-12042

ARMY ELECTRONICS RESEARCH AND DEVELOPMENT COMMAND, FORT MONMOUTH, N. J.
Electrolytes for rechargeable lithium batteries
[AD-A105230] N82-12577
Further investigation of etchants for chemically polishing SC-Cut quartz crystals
[AD-A104903] N82-12973

ARMY ENGINEER WATERWAYS EXPERIMENT STATION, VICKSBURG, MISS.
A one-dimensional plane wave propagation code for layered rate-dependent hysteretic materials
[AD-A105241] N82-12274
Advective effects in the numerical simulation of long period, large amplitude wave behavior
[AD-A105231] N82-12391
Acoustic emission from concrete specimens
[AD-A105416] N82-12476

ARMY MISSILE COMMAND, REDSTONE ARSENAL, ALA.
HAWK launcher shock absorber (Part number 11567877)
[AD-A105384] N82-12102

ARMY RESEARCH AND TECHNOLOGY LABS., MOFFETT FIELD, CALIF.
A pulse-forming network for particle path visualization
[NASA-TM-81311] N82-12036

ARO, INC., ARNOLD AIR FORCE STATION, TENN.
Evaluation and wind tunnel tests of the 4,000 lb (normal-force) pitch/yaw and roll dynamic stability balance systems for measuring direct, cross, and cross-coupling derivatives
[AD-A105122] N82-12047
An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on model scale effects
[AD-A104905] N82-12392
Infrared reflectance and refractive index measurements in vacuum-rated hemiellipsoidal mirror reflectometer from 20 to 300 deg K
[AD-A105113] N82-12933

ASSOCIATION EURATOM-CEA, FONTENAY-AUX-ROSES (FRANCE).
Electron cyclotron damping for large wave amplitude in Tokamak plasmas
[EUR-CEA-FC-1053] N82-12948

ASTRO RESEARCH CORP., CARPINTERIA, CALIF.
Critical requirements for the design of large space structures
[NASA-CR-3484] N82-12131

ATLANTIC RESEARCH CORP., ALEXANDRIA, VA.
Chemistry of combustion of fuel-water mixtures
[AD-A105401] N82-12178

ATOMIC ENERGY OF CANADA LTD., CHALK RIVER (ONTARIO).
Biological effects of low doses of ionizing radiation: Three review papers
[AECL-7059] N82-12758

ATOMIC ENERGY OF CANADA LTD., PINAWA (MANITOBA).
Radiation effects on living systems. A bibliography of AECL publications
[AECL-6797] N82-12759

AUDI NSU AUTO UNION A.G., NECKARSULM (WEST GERMANY).
Fuel savings in hot water heating plants by application of heat pumps operated with natural gas (natural gas heat pump). Project: gas engine
[BMFT-FB-T-80-125] N82-12641

AUSTRALIAN NATIONAL UNIV., CANBERRA.
Plasma research laboratory report, 1979
[INIS-MF-6087] N82-12955

AUSTRALIAN RADIATION LAB., MELBOURNE.
Measurement of gonadal and bone-marrow doses from dental radiography
[ARL/TR-022] N82-12761
Gonadal doses from radiotherapy
[ARL/TR-020] N82-12762
Genetic and mean bone-marrow doses from medical use of unsealed radioisotopes
[ARL/TR-023] N82-12763
Contributions to the genetic and mean bone-marrow doses of the Australian population from radiological procedures
[ARL/TR-017] N82-12764

AUTOMATION INDUSTRIES, INC., SILVER SPRING, MD.
Environmental data for sites in the National Solar Data Network
[DE82-000071] N82-12707

AXIOMATIX, LOS ANGELES, CALIF.
Payload/orbiter signal-processing and data-handling system evaluation
[NASA-CR-161007] N82-12107
An active alignment scheme for the MPTS array N82-12541

B

BALES-MCCOIN TRACTIONMATIC, INC., EL PASO, TEX.
Design study of a continuously variable roller cone traction CVT for electric vehicles
[NASA-CR-159841] N82-12445

BALLISTIC RESEARCH LABS., ABERDEEN PROVING GROUND, MD.
Automatic plotting routines for estimating static aerodynamic properties of long rod finned projectiles for 2,M,5
[AD-A104900] N82-12046
Yawsonde tests of 2.75-inch Mk66 mod 1rocket
[AD-A104904] N82-12101

BATTELLE COLUMBUS LABS., OHIO.
Extensible bridge-conveyor concept development
[DE81-031973] N82-12519
Extensible bridge-conveyor concepts for coal-mine face haulage
[DE81-031974] N82-12525
Energy recovery from municipal solid waste and sewage sludge using multi-solid fluidized bed combustion technology
[DE82-001142] N82-12596

BATTELLE INST., FRANKFURT AM MAIN (WEST GERMANY).
Research and development work concerning a fiber reinforced plastic material which is isoelastic to bone
[BMFT-FB-T-80-063] N82-12146

BATTELLE PACIFIC NORTHWEST LABS., RICHLAND, WASH.
United States Department of Energy thermal storage program
[DE81-030263] N82-12585
Bibliography of the seasonal thermal energy storage library
[DE81-030470] N82-12586
Technology assessment of solar energy systems: Residential use of fuelwood in the Pacific Northwest
[DE82-000046] N82-12603
Manufacturing and cost evaluation of second generation heliostats. Volume 2: Appendices
[DE82-000232] N82-12617
Treatment of biomass-gasification wastewaters using liquid-liquid extraction
[DE82-000711] N82-12662
Combustion: An oil spill mitigation tool. Phase 2: The burning of the M/T BURMAH AGATE (ex-DANALAND)
[DE82-000527] N82-12663
Geochemical modeling: A review
[DE81-028969] N82-12706
Process for the denitrification of high-level radioactive liquid wastes
[DE81-026675] N82-12925

BAYER A.G., KREFELD (WEST GERMANY).
Wet air oxidation of waste water
[BMFT-FB-T-80-132] N82-13016

BDM CORP., ALBUQUERQUE, N. MEX.
Analysis of the temperature dependence of resistivity in N-type silicon
[AD-A105192] N82-12976

BENDIX CORP., KANSAS CITY, MO.
Mechanical properties of titanium castings
[DE81-030693] N82-12222
Metal-finishing processes: Surface-finish improvement
[DE81-030166] N82-12275
Automation of a specimen stage in an electron microphobe
[DE81-030691] N82-12422

BIOASSAY SYSTEMS CORP., WOBURN, MASS.
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic fuels production
[DE81-030822] N82-12661
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic-fuels production
[DE81-030671] N82-12673

BIOTECHNOLOGY, INC., FALLS CHURCH, VA.
Biomedical research
[NASA-CR-3487] N82-12751

BOEING AEROSPACE CO., SEATTLE, WASH.
SPS large array simulation N82-12540
SPS phase control studies N82-12549
SPS fiber optic link assessment N82-12550
High efficiency SPS klystron design N82-12552
SPS antenna element evaluation N82-12555
Evaluation of thick wall wave guide element N82-12557
Rectenna system design N82-12561
Modified reference SPS with solid state transmitting antenna N82-12566
SPS solid state antenna power combiner N82-12567

BOEING CO., SEATTLE, WASH.
Testing of solar cell covers and encapsulants conducted in a simulated space environment
[NASA-CR-165475] N82-12571

BOEING COMMERCIAL AIRPLANE CO., SEATTLE, WASH.
In-service inspection methods for graphite-epoxy structures on commercial transport aircraft
[NASA-CR-165746] N82-12142

BOEING COMPUTER SERVICES, INC., SEATTLE, WASH.
Intermediate photovoltaic system application experiment operational performance: Executive summary. Volume 1: For Newman Power Station, El Paso, Texas
[DE81-031934] N82-12602

BOEING ENGINEERING AND CONSTRUCTION, SEATTLE, WASH.
Feasibility and economic study of medium-Btu coal gas blended with high-Btu by-product gas as an industrial energy source at Billings, Montana
[DE81-030622] N82-12254

BOLT, BERANEK, AND NEWMAN, INC., CAMBRIDGE, MASS.
Combined report number 22. SATNET development and operation, Pluribus Satellite IMP development, remote site maintenance, internet development, mobile access terminal network, TCP for the HP3000, TCP-TAC, TCP for VAX-UNIX
[AD-A104931] N82-12313
UNIX NSW front end enhancements, volume 1

TECHNISCHE PHYSISCHE DIENST TNO-TH, DELFT (NETHERLANDS).

Holographic study of impact phenomena
[TPD-1980-0-3] N82-12429

TECHNISCHE UNIVERSITAET, BRUNSWICK (WEST GERMANY).

X-ray emission of high voltage vacuum devices
N82-12348

Project PORCUPINE: Magnetometer experiment
[BMFT-FB-W-80-028] N82-12709

TECHNISCHE UNIVERSITAET, MUNICH (WEST GERMANY).

Compilation of cell data bank for automation in diagnostic cytology
[BMFT-FB-T-80-158] N82-12742

TEL-AVIV UNIV. (ISRAEL).

Fixed gain controller design for aircraft
[AD-A104877] N82-12061

TELEDYNE SYSTEMS CO., NORTHRIDGE, CALIF.

Design study report for General Aviation Loran-C receiver
[AD-A104921] N82-12062

TENNESSEE UNIV. SPACE INST., TULLAHOMA.

Two-phase flow and heat transfer under low gravity N82-12116

The three dimensional spherical model for the AGCE N82-12721

TEXAS A&M UNIV., COLLEGE STATION.

Reactions of tributylstannyl anioniods with alkyl bromides
[AD-A105433] N82-12136

Identification and toxicity of fractionated-shale-oil components
[DE81-028460] N82-12766

Minimum mean square error prediction of autoregressive moving average time series
[AD-A104939] N82-12846

Autoregressive spectral estimation, log spectral smoothing and entropy
[AD-A104940] N82-12849

A quantile function approach to the k-sample quantile regression problem N82-12870

Comments on the measurement of linear dependence and feedback between multiple time series by John Geweke
[AD-A104741] N82-12877

The finite memory prediction of covariance statonary time series
[AD-A105413] N82-12878

On some numerical properties of ARMA parameter estimation procedures
[AD-A104938] N82-12879

TEXAS SOUTHERN UNIV., HOUSTON.

Solvent extraction studies using high-molecular-weight amines
[DE81-030061] N82-12191

TEXAS UNIV., AUSTIN.

Natural exponential families with quadratic variance functions
[P-6637] N82-12844

TEXAS UNIV. AT AUSTIN.

Global Tectonics: Some Geologic analyses of observations and photographs from Skylab
N82-12494

Cultural features imaged and observed from Skylab
4 N82-12499

TEXAS UNIV. AT EL PASO.

Heat flow studies and geothermal exploration in western Trans-Pecos Texas N82-12684

TEXAS UNIV. AT SAN ANTONIO.

Medical diagnostic application of radiofrequency range electromagnetic waves N82-12746

TEXTRON BELL HELICOPTER, FORT WORTH, TEX.

Investigation of the structural degradation and personnel hazards resulting from helicopter composite structures exposed to fires and/or explosions
[AD-A104757] N82-12057

TOLEDO UNIV., OHIO.

Surface chemical reactions on stationary or rotating bodies in nonisothermal laminar boundary layer flows
N82-12153

TRITEC, INC., COLUMBIA, MD.

Advanced electrofluidic servovalve development
[AD-A105172] N82-12361

TRW DEFENSE AND SPACE SYSTEMS GROUP, REDONDO BEACH, CALIF.

S-Band Shallow Bulk Acoustic Wave (SBAW) microwave source
[NASA-CR-166744] N82-12344

Design analysis of supplemental heating systems
[DE81-030678] N82-12397

Design analysis of supplemental heating systems
[DE82-030677] N82-12398

TRW, INC., MCLEAN, VA.

Electric and hybrid vehicle environmental control subsystem study
[NASA-CR-164996] N82-12658

TUFTS UNIV., BOSTON, MASS.

The stabilization of coal-oil mixtures N82-12237

A systematic study of the effects of 3d, 4f and 5f impurities on the critical temperature of superconducting Th; measurements to 20 kilobars
N82-12958

U

ULTRASYSTEMS, INC., IRVINE, CALIF.

Thermal oxidative degradation reactions of perfluoroalkylethers
[NASA-CR-165516] N82-12135

UNION OIL CO. OF CALIFORNIA, LOS ANGELES.

Geothermal reservoir assessment: Northern basin and range province Stillwater prospect, Churchill County, Nevada
[DE82-000529] N82-12516

UNITED TECHNOLOGIES CORP., SOUTH WINDSOR, CONN.

Evaluation of shale oil as a utility gas-turbine fuel
[DE81-904234] N82-12251

Advanced cooling full-scale engine demonstration
[DE81-904253] N82-12452

Low NO sub x heavy fuel combustor concept program
[NASA-CR-165512] N82-12572

Design, construction, and operation of a full scale experimental anaerobic fermentation facility
[DE81-029028] N82-12605

UNITEX CORP., SALT LAKE CITY, UTAH.

High-temperature counter-flow recuperator
[DE81-0319[illegible] N82-12424

UNIVERSAL ENERGY SYSTEMS, INC., DAYTON, OHIO.

Radio shack TRS-80 pocket computer solutions to composite materials formulas
[AD-A105173] N82-12145

UNIVERSITY COLL., CARDIFF (WALES).

Infrared spectroscopy of microorganisms near 3.4 microns in relation to geology and astronomy
[PREPRINT-69] N82-12713

The Universe: Past and present reflections
[PREPRINT-70] N82-13032

UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES.

Feasibility study of device synthesis of non-linear filters
[AD-A105417] N82-12354

On the manipulation of spreading rates of forced mixing layers
[AD-A105238] N82-12390

Studies of optical-beam phase-conjugation by nonlinear refraction
[AD-A105066] N82-12435

Formation evaluation in liquid-dominated geothermal reservoirs
[DOE/ET-28384/T1] N82-12514

Nonlinear real-time optical signal processing
[AD-A105186] N82-12798

UNIVERSITY OF SOUTHWESTERN LOUISIANA, LAFAYETTE.

Design and construction of a virtual machine resource binding language N82-12812

UTAH STATE UNIV., LOGAN.

Finite element analysis of soil-sheet pile interaction N82-12268

Limit on remote FTIR detection of trace gases
[AD-A104842] N82-12511

Higher plant acclimation to solar ultraviolet-B radiation N82-12737

UTAH UNIV., SALT LAKE CITY.

Investigation of factors affecting the in-situ combustion retorting of oil shale
[DE82-0004[illegible]] N82-12200

Characterization of western coals and coal macerals by solid state nuclear magnetic resonance spectroscopy
[DE81-028928] N82-12265

V

VACUUMSCHMELZE G.M.B.H., HANAU (WEST GERMANY).

High field superconductors of NbTi with current capacities in excess of 3000A for application in magnet systems with alternating field components
[BMFT-FB-T-81-009] N82-12367

VALVO G.M.B.H., HAMBURG (WEST GERMANY).

New Photolithographic methods: Projection alignment for the metallization of highly integrated circuits
[BMFT-FB-T-81-018] N82-12427

New photolithographic method for small dimension. Direct step and repeat technique (silicon repeater)
[BMFT-FB-T-81-019] N82-12428

VANDERBILT UNIV., NASHVILLE, TENN.

Investigation of the electrochemical behavior of ion-implanted Ti-Pt alloys N82-12212

VARTA AKTIENGESELLSCHAFT FORSCHUNGS- UND ENTWICKLUNGSZENTRUM, KELKHEIM (WEST GERMANY).

Galvanic high energy cells with molten salt electrolytes
[BMFT-FB-T-81-048] N82-12643

VEREINIGTE FLUGTECHNISCHE WERKE-FOKKER G.M.B.H., BREMEN (WEST GERMANY).

Influence of a multiaxial membrane stress situation on the stress concentration factor, using the example of an open unfinished drilled hole
[EK-43-B/251/79] N82-12484

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG.

Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164983] N82-12060

VIRGINIA UNIV., CHARLOTTESVILLE.

Transportation systems evaluation methodology development and applications, phase 3
[NASA-CR-164999] N82-12051

W

WACKER-CHEMIE G.M.B.H. BURGHAUSEN (WEST GERMANY).

Research and development on new technologies for the preparation of III-V semiconductor materials and on methods for evaluation of the quality of these materials. Project Ga(AsP) expitaxial layers and substrates for them
[BMFT-FB-T-81-020] N82-12982

WASHINGTON STATE UNIV., PULLMAN.

Hydrologic studies support. INTERCOMP code conversion
[DE81-030318] N82-12515

WASHINGTON UNIV., SEATTLE.

Application of singular perturbation theory
N82-12050

Instrument failure detection for a linear uncertain system N82-12073

Soil stabilization by chemical additives
N82-12270

Modeling and performance optimization of large-scale data-communication networks
N82-12290

Wave induced vibrations of continuous floating structures N82-12467

A critical void growth failure criterion developed for dynamic and static loading conditions N82-12469

Chemical and geochemical studies off the coast of Washington
[DE81-030319] N82-12513

Benefit-cost analysis with uncertain information: An application in air pollution control N82-12652

An investigation of sand and sandstone permeability degradation at elevated temperature and pressure
N82-12683

WASHINGTON UNIV., ST. LOUIS, MO.

Nuclear magnetic resonance studies of solid krypton N82-12961

WEATHER WING (7TH), SCOTT AFB, ILL.

Terminal forecast reference notebook, detachment 12, 15th weather squadron for Selfridge Air National Guard Base, Michigan
[AD-A105083] N82-12727

Terminal forecast reference notebook for Scott Air Force Base, Illinois
[AD-A105084] N82-12726

WEISS TECHNIK G.M.B.H., REISKIRCHEN (WEST GERMANY).

Practical demonstration of heat pumps for utilization of animal-generated heat
[BMFT-FB-T-80-100] N82-12403

WESTAQ CORP., GRAND VALLEY, COLO.

Meteorological and climatological investigation: Review of January - June 1980 investigative report, volume 1
[DE81-030741] N82-12729

Meteorological and climatological investigation: Review of January - June 1980 investigative period, volume 2
[DE81-030742] N82-12730

WESTINGHOUSE ELECTRIC CORP., EAST PITTSBURGH, PA.

Economic assessment of advanced central-receiver solar-thermal power systems: Executive summary
[DOE/SF-10601/0] N82-12624

WESTINGHOUSE ELECTRIC CORP., PITTSBURGH, PA.

Steam turbine blades: Considerations in design and a survey of blade failures
[DE81-904249] N82-12450

WILLIAMS RESEARCH CORP., WALLED LAKE, MICH.

AGT-102 automotive gas turbine
[NASA-CR-165353] N82-12444

WISCONSIN UNIV., MADISON.

Coal combustion in high convective flows
[DE81-030391] N82-12194

Comments on the hydrogen solubility data for liquid lead, lithium and lithium-lead alloys and review of a tritium-solubility model for lithium-lead alloys
[DE81-030826] N82-12220

High-mode-number MHD stability of a toroidal multipole
[DE81-030484] N82-12950

Y

YALE UNIV., NEW HAVEN, CONN.

Experiments with waves on relativistic electron beams
[AD-A105094] N82-12918

YOKOHAMA NATIONAL UNIV. (JAPAN).

Interaction of ion-acoustic solitons in multi-dimensional space, 2
[IPPJ-535] N82-12941

Z

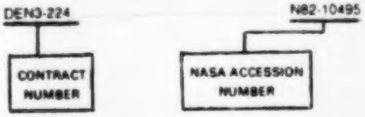
ZAWADZKI (EDWARD A.) LTD., MCMURRAY, PA.

Preliminary study: Use of low-sulfur coal and coal cleaning in control of acid rain
[DE81-028930] N82-12675

CONTRACT NUMBER INDEX

SCIENTIFIC AND TECHNICAL AEROSPACE REPORTS VOLUME 20 NUMBER 3

Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number the NASA accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order. The NASA accession number denotes the number by which the citation is identified.

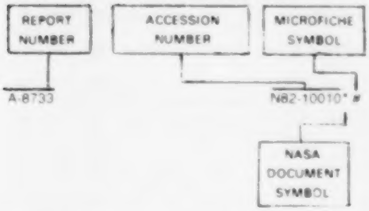
REPORT/ACCESSION NUMBER INDEX

Typical Report/Accession Number Index Listing



Listings in this index are arranged alphanumerically by report number. The NASA accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to eleven special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA
University of California, Berkeley

COLORADO
University of Colorado, Boulder

DISTRICT OF COLUMBIA
Library of Congress

GEORGIA
Georgia Institute of Technology, Atlanta

ILLINOIS
The John Crerar Library, Chicago

MASSACHUSETTS
Massachusetts Institute of Technology, Cambridge

MISSOURI
Linda Hall Library, Kansas City

NEW YORK
Columbia University, New York

OKLAHOMA
University of Oklahoma, Bizzell Library

PENNSYLVANIA
Carnegie Library of Pittsburgh

WASHINGTON
University of Washington, Seattle

NASA publications (those indicated by an "*" following the accession number) are also received by the following public and free libraries:

CALIFORNIA
Los Angeles Public Library
San Diego Public Library

COLORADO
Denver Public Library

CONNECTICUT
Hartford Public Library

MARYLAND
Enoch Pratt Free Library, Baltimore

MASSACHUSETTS
Boston Public Library

MICHIGAN
Detroit Public Library

MINNESOTA
Minneapolis Public Library and Information Center

NEW JERSEY
Trenton Public Library

NEW YORK
Brooklyn Public Library
Buffalo and Erie County Public Library
Rochester Public Library
New York Public Library

OHIO
Akron Public Library
Cincinnati and Hamilton County Public Library
Cleveland Public Library
Dayton Public Library
Toledo and Lucas County Public Library

TEXAS
Dallas Public Library
Fort Worth Public Library

WASHINGTON
Seattle Public Library

WISCONSIN
Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy of microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "#" and "*", from: ESA - Information Retrieval Service, European Space Agency, 8-10 rue Mario-Nikis, 75738 Paris CEDEX 15, France.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

WHAT YOU CAN DO FOR *STAR*

All users of this abstract service are urged to forward reports to be considered for announcement in *STAR*. This will aid NASA in its efforts to provide the fullest possible coverage of all scientific and technical publications that might support aeronautics and space research and development. If you have prepared relevant reports (other than those that you will transmit to NASA, DoD, or DOE through the usual contract- or grant-reporting channels), please send them for consideration to the NASA Scientific and Technical Information Facility, P.O. Box 8757, B.W.I. Airport, Maryland 21240.

Reprints of journal articles, book chapters, and conference papers are also welcome. These will be considered for announcement in *STAR's* companion journal, *International Aerospace Abstracts*.

You may specify a particular source to be included in a report announcement if you wish; otherwise the report will be placed on public sale at the National Technical Information Service. Copyrighted publications will be announced but not distributed or sold.

PURCHASE OF *STAR*

The semimonthly issues are available postpaid on subscription and in single copy from the Superintendent of Documents, United States Government Printing Office, Washington, D.C. 20402, United States of America.

Semimonthly issues

Annual subscription rates: $90.00 domestic; $112.00 foreign. Price per single copy: $4.75 domestic; $5.95 foreign.

Annual index issues

Pricing based upon pagination.

Domestic subscription rates

Apply to the United States, Canada, Mexico, and all Central and South American countries, except as noted below.

Foreign subscription rates

Apply to Argentina, Brazil, French Guiana, Guyana, Surinam, Belize, and all other countries throughout the world.

Payment should be by check, money order, or document coupons, and must accompany order. Remittances from foreign countries should be made by international money order or draft on an American bank, payable to the Superintendent of Documents, or by UNESCO book coupons.

PUBLISHED BY:

UNITED STATES GOVERNMENT
NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
SCIENTIFIC AND TECHNICAL INFORMATION BRANCH

Scientific and Technical Aerospace Reports, Volume 20, is prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by PRC Government Information Systems.

The Administrator of the National Aeronautics and Space Administration has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Agency. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through March 31, 1982.

US ISSN 0036-8741

INTRODUCTION

Scientific and Technical Aerospace Reports (STAR) is a major component of a comprehensive National Aeronautics and Space Administration information system covering aeronautics, space, and supporting disciplines. *STAR* is issued on the 8th and 23rd of each month and announces current publications of the following types:

- NASA, NASA contractor, and NASA grantee reports
- Reports issued by other U.S. Government agencies, domestic and foreign institutions, universities, and private firms
- Translations in report form
- NASA-owned patents and patent applications
- Dissertations and theses

Cumulative index volumes are published annually.

Journal, book, and conference literature, cover-to-cover journal translations, and certain foreign dissertations are announced in a companion journal, *International Aerospace Abstracts (IAA)*, available on subscription from the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

SUBJECT SCOPE

Subject scope of *STAR*, and *IAA* includes all aspects of aeronautics and space research and development, supporting basic and applied research, and applications. Aerospace aspects of earth resources, energy development, conservation, oceanography, environmental protection, urban transportation, and other topics of high national priority are also covered.

OTHER NASA PUBLICATIONS

Other NASA publications and information services are described in the publication, *The NASA Scientific and Technical Information System ... and How to Use It*, available without charge from the NASA Scientific and Technical Information Facility, P.O. Box 8757, B.W.I. Airport, Maryland 21240.

HOW TO USE *STAR* SUBJECT CATEGORIES

STAR is categorized by 10 major subject divisions divided into 74 specific subject categories and one general category/division. The major subject divisions are listed in the Table of Contents, together with a note for each that defines its scope and provides any cross-references. For example:

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

Each major division is further divided into as many as nine specific categories, which are identified by category numbers.

Abstracts in *STAR* are grouped by specific category, the categories appearing in sequential order. Category breaks in the abstract section are identified by the category number and title, and a scope note. Cross-references to other categories are provided as appropriate. For example:

02 AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

CROSS-REFERENCES

Individual *STAR* abstracts are not ordinarily cross-referenced, except for certain conference reports or book translations that have had separate abstracts written for their component papers or chapters. Citations and abstracts of the components follow immediately after those of the parent document. When the subject content of a component differs sufficiently from the general content of the parent, a cross-reference citation also is printed at the end of the category to which it normally would have been assigned if it were independent.

DOCUMENTS ON MICROFICHE

Documents on microfiche(1) are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

AVAILABILITIES

One or more sources from which a document announced in *STAR* is available to the public is given in each citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code following the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Adminstration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its' Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free. (See discussion of patents and patent applications below.)

NASA PATENTS AND PATENT APPLICATIONS

Patents and patent applications owned by NASA are announced in *STAR* under appropriate subject categories and are referenced in the *STAR* indexes. In the Report/Accession Number Index, patents are indexed by the NASA Case Number (which appears in lieu of the report number in other indexes), the U.S. Patent Number, the U.S. Patent Application Serial Number, and the U.S. Patent Class. Patent applications for which patents have not yet been issued are indexed by the NASA Case Number and the U.S. Patent Application Serial Number.

NASA *patent application specifications* are sold in paper copy by the National Technical Information Service at price code A02 ($6.00 domestic; $12.00 foreign). Microfiche are sold at price code A01 ($4.00 domestic; $8.00 foreign). The US-Patent-Appl-SN- number should be used in ordering either paper copy or microfiche from NTIS. Printed copies of *patents* (which are not microfiched) are available for purchase at 50 cents per copy from:

Commissioner of Patents and Trademarks
U.S. Patent and Trademark Office
Washington, D.C. 20231

When ordering patents, the U.S. Patent Number should be used, and payment must be remitted in advance, preferably by money order or check payable to the Commissioner of Patents and Trademarks. Prepaid purchase coupons for ordering are also available from the Patent and Trademark Office. The patents and patent applications announced in *STAR* are owned by NASA and are available for royalty-free licensing. Requests for licensing terms and further information should be addressed to:

Assistant General Counsel for Patent Matters/Code GP-1
National Aeronautics and Space Administration
Washington, D.C. 20546

ELIGIBILITY AND REGISTRATION FOR NASA INFORMATION PRODUCTS AND SERVICES

A variety of services, in addition to the distribution of NASA scientific and technical reports and of *STAR* and its cumulative indexes, is available to organizations of the following types that have registered with NASA to receive specific services or products:

1. NASA offices, research centers, contractors, subcontractors, grantees, and consultants;
2. Other U.S. Government agencies and their contractors;
3. Libraries in the United States that have arrangements with NASA to maintain collections of NASA documents for public reference;
4. Other organizations in the United States having a need for NASA documents in work related to aeronautics and space research;
5. Organizations abroad that have established reciprocal document exchange arrangements with NASA.

Only the central service points or central points of document acquisition and control within qualified organizations are eligible to register for NASA products and services. Domestic organizations that may be eligible to receive various classes of NASA publications and services should address their requests for registration or for further information to:

NASA Scientific and Technical Information Facility
Attn.: Registration Activity
P.O. Box 8757
B.W.I. Airport, Maryland 21240

Organizations abroad should direct requests to the same address, but to the attention of: International Exchange Program.

AVAILABILITY OF *STAR* ABSTRACTS ON MICROFICHE

Microfiche of the abstract sections of this issue and other issues of *STAR* are available on annual subscription from NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield, Virginia 22161. Annual subscription rates are $50.00 North America; $100.00 foreign. Abstract sections for previous years retroactive to 1964 are available at the current rates. Microfiche for individual *STAR* issue abstract sections are not available.

N01	30.00[1]	45.00

VOLUME 20 NUMBER 4 FEBRUARY 23, 1982

TABLE OF CONTENTS

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

01 AERONAUTICS (GENERAL) 431

02 AERODYNAMICS 439

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*

03 AIR TRANSPORTATION AND SAFETY 444

Includes passenger and cargo air transport operations; and aircraft accidents.

For related information see also *16 Space Transportation* and *85 Urban Technology and Transportation*.

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION N.A.

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

For related information see also *17 Spacecraft Communications, Command and Tracking* and *32 Communications*.

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE 446

Includes aircraft simulation technology.

For related information see also *18 Spacecraft Design, Testing and Performance* and *39 Structural Mechanics*.

06 AIRCRAFT INSTRUMENTATION 447

Includes cockpit and cabin display devices; and flight instruments.

For related information see also *19 Spacecraft Instrumentation* and *35 Instrumentation and Photography*.

07 AIRCRAFT PROPULSION AND POWER 448

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

For related information see also *20 Spacecraft Propulsion and Power, 28 Propellants and Fuels*, and *44 Energy Production and Conversion*.

08 AIRCRAFT STABILITY AND CONTROL 449

Includes aircraft handling qualities; piloting; flight controls; and autopilots.

09 RESEARCH AND SUPPORT FACILITIES (AIR) 450

Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

For related information see also *14 Ground Support Systems and Facilities (Space)*.

ASTRONAUTICS

Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

For related information see also *Aeronautics*

12 ASTRONAUTICS (GENERAL) 451

For extraterrestrial exploration see *91 Lunar and Planetary Exploration*.

13 ASTRODYNAMICS 451

Includes powered and free-flight trajectories; and orbit and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) N.A.

Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators.

For related information see also *09 Research and Support Facilities (Air)*.

15 LAUNCH VEHICLES AND SPACE VEHICLES 452

Includes boosters; manned orbital laboratories; reusable vehicles; and space stations.

16 SPACE TRANSPORTATION N.A.

Includes passenger and cargo space transportation, e.g., shuttle operations; and rescue techniques.

For related information see also *03 Air Transportation and Safety* and *85 Urban Technology and Transportation*.

17 SPACECRAFT COMMUNICATION, COMMAND AND TRACKING 452

Includes telemetry; space communications networks; astronavigation; and radio blackout.

For related information see also *04 Aircraft Communications and Navigation* and *32 Communications*.

18 SPACECRAFT DESIGN, TESTING AND PERFORMANCE 453

Includes spacecraft thermal and environmental control; and attitude control.

For life support systems see *54 Man/System Technology and Life Support*. For related information see also *05 Aircraft Design, Testing and Performance* and *39 Structural Mechanics*.

19 SPACECRAFT INSTRUMENTATION 453

For related information see also *06 Aircraft Instrumentation* and *35 Instrumentation and Photography*.

20 SPACECRAFT PROPULSION AND POWER N.A.

Includes main propulsion systems and components, e.g., rocket engines; and spacecraft auxiliary power sources.

For related information see also *07 Aircraft Propulsion and Power, 28 Propellants and Fuels*, and *44 Energy Production and Conversion*.

CHEMISTRY AND MATERIALS

Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

23 CHEMISTRY AND MATERIALS (GENERAL) 453

Includes biochemistry and organic chemistry.

24 COMPOSITE MATERIALS 454

Includes laminates.

25 INORGANIC AND PHYSICAL CHEMISTRY 454

Includes chemical analysis, e.g., chromatography; combustion theory; electrochemistry; and photochemistry.

For related information see also *77 Thermodynamics and Statistical Physics.*

26 METALLIC MATERIALS 459

Includes physical, chemical, and mechanical properties of metals, e.g., corrosion; and metallurgy.

27 NONMETALLIC MATERIALS 463

Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials.

28 PROPELLANTS AND FUELS 464

Includes rocket propellants, igniters, and oxidizers; storage and handling; and aircraft fuels.

For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power,* and *44 Energy Production and Conversion.*

ENGINEERING

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

For related information see also *Physics.*

31 ENGINEERING (GENERAL) 466

Includes vacuum technology; control engineering; display engineering; and cryogenics.

32 COMMUNICATIONS 470

Includes land and global communications; communications theory; and optical communications.

For related information see also *04 Aircraft Communications and Navigation* and *17 Spacecraft Communications, Command and Tracking.*

33 ELECTRONICS AND ELECTRICAL ENGINEERING 477

Includes test equipment and maintainability; components, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuity.

For related information see also *60 Computer Operations and Hardware* and *76 Solid-State Physics.*

34 FLUID MECHANICS AND HEAT TRANSFER 481

Includes boundary layers; hydrodynamics; fluidics; mass transfer; and ablation cooling.

For related information see also *02 Aerodynamics* and *77 Thermodynamics and Statistical Physics.*

35 INSTRUMENTATION AND PHOTOGRAPHY 486

Includes remote sensors; measuring instruments and gages; detectors; cameras and photographic supplies; and holography.

For aerial photography see *43 Earth Resources.* For related information see also *06 Aircraft Instrumentation* and *19 Spacecraft Instrumentation.*

36 LASERS AND MASERS 487

Includes parametric amplifiers.

37 MECHANICAL ENGINEERING 489

Includes auxiliary systems (non-power); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY 490

Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS 491

Includes structural element design and weight analysis; fatigue; and thermal stress.

For applications see *05 Aircraft Design, Testing and Performance* and *18 Spacecraft Design, Testing and Performance.*

GEOSCIENCES

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

For related information see also *Space Sciences.*

42 GEOSCIENCES (GENERAL) N.A.

43 EARTH RESOURCES 495

Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography.

For instrumentation see *35 Instrumentation and Photography.*

44 ENERGY PRODUCTION AND CONVERSION 498

Includes specific energy conversion systems, e.g., fuel cells and batteries; global sources of energy; fossil fuels; geophysical conversion; hydroelectric power; and wind power.

For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power, 28 Propellants and Fuels,* and *85 Urban Technology and Transportation.*

45 ENVIRONMENT POLLUTION 506

Includes air, noise, thermal and water pollution; environment monitoring; and contamination control.

46 GEOPHYSICS 510

Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism.

For space radiation see *93 Space Radiation.*

47 METEOROLOGY AND CLIMATOLOGY 515

Includes weather forecasting and modification.

48 OCEANOGRAPHY 517

Includes biological, dynamic and physical oceanography; and marine resources.

LIFE SCIENCES

Includes sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

51 LIFE SCIENCES (GENERAL) 518
Includes genetics.

52 AEROSPACE MEDICINE 518
Includes physiological factors; biological effects of radiation; and weightlessness.

53 BEHAVIORAL SCIENCES N.A.
Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT 520

DEVELOPMENT AND EVALUATION OF AUTOMATIC LANDING CONTROL LAWS FOR LIGHT WING LOADING STOL AIRCRAFT

B. Feinreich, O. Degani, and G. Gevaert Jul. 1981 371 p refs

(Contract NAS2-9410)

(NASA-CR-166160) Avail: NTIS HC A16/MF A01 CSCL 01C

Automatic flare and decrab control laws were developed for NASA's experimental Twin Otter. This light wing loading STOL aircraft was equipped with direct lift control (DLC) wing spoilers to enhance flight path control. Automatic landing control laws that made use of the spoilers were developed, evaluated in a simulation and the results compared with these obtained for configurations that did not use DLC. The spoilers produced a significant improvement in performance. A simulation that could be operated faster than real time in order to provide statistical landing data for a large number of landings over a wide spectrum of disturbances in a short time was constructed and used in the evaluation and refinement of control law configurations. A longitudinal control law that had been previously developed and evaluated in flight was also simulated and its performance compared with that of the control laws developed. Runway alignment control laws were also defined, evaluated, and refined to result in a final recommended configuration. Good landing performance, compatible with Category 3 operation into STOL runways, was obtained. Author

Scientific and Technical Aerospace Reports

A Semimonthly Publication of the National Aeronautics and Space Administration

01 AERONAUTICS (GENERAL)

N82-13044* National Aeronautics and Space Administration, Washington, D. C.
AERONAUTICAL ENGINEERING: A CONTINUING BIBLIOGRAPHY WITH INDEXES, SUPPLEMENT 140
Oct. 1981 118 p
(NASA-SP-7037(140)) Avail: NTIS HC $5.00 CSCL 01A

This bibliography lists 386 reports, articles, and other documents introduced into the NASA scientific and technical information system in September 1981. A.R.H.

N82-13045*# National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
AN APPROXIMATE ANALYTICAL METHOD FOR VORTEX-LIFT AND CENTER OF PRESSURE ON THE SLENDER WING
Yin Xieyuan (Science and Technology Univ. of China) Dec. 1981 12 p refs Transl. into ENGLISH from Acta Aeron. et Astronautica Sinica (China), v. 1, no. 1, 1980 p 1-6
(NASA-TM-83198; L-14848) Avail: NTIS HC A02/MF A01 CSCL 01B

A simplified approximate analytical method for predicting vortex lift and center of pressure on slender wings is presented. Two empirical corrections are proposed. The method is compared with experimental data and gives accurate estimates. E.A.K.

CONSOLIDATION OF DATA BASE FOR ARMY GENERALIZED MISSILE MODEL Final Report
Daniel J. Klenke and Michael J. Hemsch Aug. 1980 101 p refs
(Contract NAS2-10081).
(NASA-CR-166273; NEAR-TR-221) Avail: NTIS HC A06/MF A01 CSCL 01B

Data from plume interaction tests, nose mounted canard configuration tests, and high angle of attack tests on the Army Generalized Missile model are consolidated in a computer program which makes them readily accessible for plotting, listing, and evaluation. The program is written in FORTRAN and will run on an ordinary minicomputer. It has the capability of retrieving any coefficient from the existing DATAMAN tapes and displaying it in tabular or plotted form. Comparisons of data taken in several wind tunnels and of data with the predictions of Program MISSILE2 are also presented. S.L.

N82-13047*# National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
WIND-TUNNEL INVESTIGATION OF THE TAIL-SPOILER CONCEPT FOR STALL-PREVENTION ON GENERAL AVIATION AIRPLANES
Dale R. Satran Nov. 1981 40 p refs
(NASA-TM-83208; L-14703) Avail: NTIS HC A03/MF A01 CSCL 01B

The longitudinal aerodynamic characteristics of a full scale, single engine general aviation airplane equipped with an angle of attack limiting concept which used a tail mounted spoiler for stall prevention were investigated. The tail spoiler was deployed as a nonlinear function of changes in angle of attack in a narrow angle of attack range immediately preceding the stall angle. Spoiler deployment produced a nose down moment which limited the nose up trim capability of the elevator to an angle of attack below the stall angle of the airplane. The tail spoiler system produced significant increases in longitudinal stability and elevator hinge moments near the stall. The effects of power, flaps, and center of gravity position are also studied. E.A.K.

THE IMPACT OF NEW GUIDANCE AND CONTROL SYSTEMS ON MILITARY AIRCRAFT COCKPIT DESIGN
Aug. 1981 217 p refs In ENGLISH; partly in FRENCH Symp. held in Bad-Cannstatt, West Germany, 5-8 May 1981
(AGARD-CP-312; ISBN-92-835-0297-3) HC A10/MF A01

The requirements and technologies involved in control systems were reviewed. Topics incude: displays; controls/displays system integration; automated systems/man interface; and cockpit systems evaluation. Emphasis is placed on the design of a cockpit layout with controls and displays that maximize the overall aircraft capability while keeping the pilot's workload within bounds by the use of more automation of system management. For individual titles, see N82-13049 through N82-13064.

HOW THE HELICOPTER COCKPIT DESIGNER USES DIGITAL AVIONICS c06
John H. Emery *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 13 p ref (For primary document see N82-13048 04-01)
Avail: NTIS HC A10/MF A01

An overview of the approaches to helicopter cockpit design made possible through the application of advanced multiplex technology to cockpit displays and controls is presented. This technology enables the pilot to have more information available while, at the same time, reducing his workload, and provides for substantially improved cockpit management. One of the major research programs through which this technology was tailored for military helicopters is ADAS (Army Digital Avionics System). This program is discussed, along with Bell helicopter cockpit designs. T.M.

ELECTRONIC FLIGHT DECK DISPLAYS FOR MILITARY TRANSPORT AIRCRAFT c06
R. A. Chorley *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 12 p refs (For primary document see N82-13048 04-01)
Avail: NTIS HC A10/MF A01

These display systems offer operational and economic advantages which can be realized in military as well as in civil aircraft. In particular, the flexibility of the display formats which can be provided, and the ease with which the information content can be changed, enable all the information required for the control of a transport aircraft to be displayed on the main panel, and go a long way towards making operation by a two-man crew possible. In addition, the flexibility of an electronic display system makes it feasible to minimize the effect of failures witin the display system to an extent which is impossible in the case of conventional instruments. Full realization of this capability, which calls for careful selection of the system architecture to be employed, may lead to a significant in mission success. A discussion of CRT displays is presented. T.M.

N82-13051# Aeronautical Systems Div., Wright-Patterson AFB, Ohio. Directorate of Avionics Engineering.
COLOR CRT DISPLAYS FOR THE COCKPIT c06
Harry L. Waruszewski *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 22 p refs (For primary document see N82-13048 04-01)
Avail: NTIS HC A10/MF A01

Color displays are currently being proposed for installation or are being installed in civilian and military aircraft cockpits. The complexity of designing a good color display is much greater than that of a monochromatic display. The human factors data and cockpit requirements needed to develop color cockpit displays so that requirements for a usable display can be generated are discussed. The color display technology was evaluated with respect to satisfying the established human factors requirements. Test methodologies need to be developed to determine compliance of the color displays to the specification requirement. Finally, the need for displays to be integrated into the cockpit using total cockpit human factors criteria to maximize the possible workload reduction and safety of the aircraft is discussed. T.M.

N82-13052# Thomson-CSF, Paris (France).
HEAD UP DISPLAYS c06
Claude Maureau *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 7 p (For primary document see N82-13048 04-01)
Avail: NTIS HC A10/MF A01

The displays present information to pilots without depriving them of a simultaneous external view. This implies that head-up diepdisplays are collimated displays. The problems involved with collimation are discussed and the possibility of head-up providing pilots with directional information is considered. T.M.

N82-13053# Army Avionics Research and Development Activity, Fort Monmouth, N. J.
INTEGRATION OF CONTROLS AND DISPLAYS IN US ARMY HELICOPTER COCKPITS c06
J. A. Dasaro and C. T. Elliott *In* AGARD The Impacts of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 19 p refs (For primary document see N82-13048 04-01)
Avail: NTIS HC A10/MF A01

Expanded missions such as anti-armor, night surveillance, and air-to-air, coupled with the survivability requirement of nap-of-the-Earth flight, dictate the approach to cockpit design. This approach must apply the latest technological innovations in the areas of controls, displays multiplexing, and microprocessors to unburden the pilot. Space, weight, and cost constraints placed on the cockpit system designers must also be satisfied. The U.S. Army completed a full scale engineering development program in the area of cockpit integration, and is currently involved in a more ambitious exploratory development effort. An overview of these efforts to integrate the helicopter cockpit, including results of simulation experiments and operational flight tests, is presented. T.M.

N82-13054# Collins Radio Co., Cedar Rapids, Iowa. Government Avionics Div.
A STANDARD CONTROL DISPLAY UNIT FOR MULTI-AIRCRAFT APPLICATION c06
Ronald L. Swanson and Craig R. Scougton *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 10 p (For primary document see N82-13048 04-01)
Avail: NTIS HC A10/MF A01

The need for standardization of military hardware is well documented both within the US DOD and NATO. Standardization issues revolve mainly around interoperability, logistics, and life-cycle cost advantages. The issue of standardization and its suitability in the design of aircraft control/display units (CDU) is addressed. Potential benefits, requirements, and remaining problems associated with standardization of avionics control displays are discussed. Included is a discussion of a CDU that is currently being produced which has many of the features considered essential to the ultimate standard CDU. T.M.

N82-13055# British Aerospace Aircraft Group, Preston (England). Military Aircraft Div.
DEVELOPMENT OF A MINIATURISED DIGITAL THRUST DEMAND UNIT c07
Arthur Kaye *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 10 p (For primary document see N82-13048 04-01)
Avail: NTIS HC A10/MF A01

Present generation analogue units were analyzed in order to produce design for the line replaceable units (L.R.U.S.). The elimination of the motion conversion chain, linear to angular, angular to linear is shown to afford significant savings in weight and volume. Angular motion and compliant force throttles, while creating maximum space saving, are shown to be ergonomically inferior to a linear input. An explanation of the operating principles of the linear stepper motor chosen as the auto-pilot prime mover is given with both the inherent advantages and disadvantages used to good effect in the overall design. Digital position encoding completes the design of the prototype unit and the results to date of the testing of this unit are given with recommendations for the design of a production unit. T.M.

N82-13056# Crouzet Aerospace and Systems, Valence (France).
USING VOICE CONTROL ONBOARD COMBAT AIRCRAFT [UTILISATION DE LA COMMANDE VOCALE A BORD DES AERONEFS DE COMBAT] c06
J. R. Coster and J. M. Melocco *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpits Design Aug. 1981 5 p In FRENCH (For primary document see N82-13048 04-01)
Avail: NTIS HC A10/MF A01

The use of the voice would be a valuable tool in resolving problems associated with pilot workload, in reducing the surface of the flight instrument system and the complexity of the man machine interface in high performance combat aircraft. A program established at the Laboratory of information for Mechanics and Engineering Sciences validates in aircraft environments the methods of speech recognition and synthesis developed in research laboratories. It is merely a matter of the universal recognition, at the acoustic level of isolated words pronounced by a single speaker. The techniques used are described. These include laboratory experiments involving an aeronautical dialog in a noisy environment and experimentation with a simulator of a vocal dialog applied to an aircraft with modern weapons and to the study of human factors. Experimentation also takes place in a flight simulator. Transl. by A.R.H.

N82-13057# Smiths Industries Ltd., Bishops Cleeve (England). Aerospace and Defence Systems.
COMMAND-RESPONSE DATA TRANSMISION TO MECHANICAL SYSTEMS MANAGEMENT EFFECT ON THE CREW/SYSTEM INTERFACE c06
I. Moir (British Aerospace Aircraft Group), C. Moxey, and P. A. Lancaster (British Aerospace Aircraft Group) *In*AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 12 p (For primary document see N82-13048 04-01)
Avail: NTIS HC A10/MF A01

The availability of low cost, high reliability micro-electronic digital devices digital data transmission systems an attractive proposition for aircraft data handling systems. Apart from the advantages of accuracy and high data rates which digital devices offer, significant improvements in system performance, weight and reliability are possible. Initially the use of digital data system was confined to aircraft avionics systems embracing navigation, weapon aiming and flight control functions. More recently the application techniques extended to the centralized control of mechanical system management. A example of an engine failure and shut-down in flight is given to demonstrate the interactive nature of data handling between two data buses and the effects upon advanced cockpit displays. A.R.H.

N82-13058# Naval Air Development Center, Warminster, Pa.

THE INTELLIGENT USE OF INTELLIGENT SYSTEMS: PROBLEMS IN ENGINEERING MAN/MACHINE SYMBIOSIS c54

J. Hopson, W. Zachary (Analytics, Inc., Willow Grove, Pa.), and N. Lane *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 16 p refs (For primary document see N82-13048 04-01)

Avail: NTIS HC A10/MF A01

A methodology to structure the process of designing 'intelligent systems' was generated in the course of several specific projects undertaken to develop such systems for a variety of airborne platforms. The general goals of these projects are to improve system performance by enhancing the effectiveness of information management within the total avionics systems. Results from the studies are summarized and the knowledge gained is related to a systematic design/evaluation approach. A.R.H.

MONOCULAR VISION AND TACTICAL FLIGHT ON THE HELICOPTER [VISION MONOCULAIRE ET VOL TACTIQUE SUR HELICOPTERE] c06

J. P. Papin, J. P. Menu, and G. Santucci *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 14 p refs In FRENCH (For primary document see N82-13048 04-01)

Avail: NTIS HC A10/MF A01

The direction of eye movement of 7 pilots and 3 navigators was recorded in 8 hour helicopter flight during flight with obstacle missions. Each subject performed the mission while having variable conditions of monocular or binocular vision, with normal visual field or with the field reduced from 60 deg to 40 deg. Analysis of visual behavior concentrated on localization of viewing in relation to the cockpit and the object looked at. The localizations were analyzed in terms of passage from one object to another or m one zone to another in terms of the number of stops in different localizations and in terms of the total duration or method of the stops. Results show that (1) for a given condition, the subjects reacted in a relatively similar manner; (2) behavior was modified according to condition of vision: the more the field was reduced, the more the pilot increased his field of exploration and looked closer to the apparatus and to the instruments; (3) during stationary flights the behavior modification became amplified; and (4) monocular vision is more degrading of behavior reduction of the visual field. Transl. by A.R.H.

EXPERIMENTAL INVESTIGATION OF A HELMET MOUNTED SIGHT/DISPLAY FOR HELICOPTER c06

R. Beyer, E. Danneberg, E. Kohnen, and H. Stein *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 11 p (For primary document see N82-13048 04-01)

Avail: NTIS HC A10/MF A01

A helmet mounted sight/display (HMS/D) combined with an infrared camera and electronic instrument displays was investigated as a guidance aid for the low level flight of helicopters at night. The static and dynamic accuracy of the tracking mechanism which aligns the lines of sight of both the pilot and the camera was determined by means of a target and motion simulator. System performance was checked with a Bo 105 helicopter in low level flight at night. From the results obtained the importance of the HMS/D as an guidance aid becomes evident relative to other night vision/display systems. Author

N82-13061# Royal Aircraft Establishment, Farnborough (England). Flight Systems Dept.

USE OF A HELMET-MOUNTED MATRIX DISPLAY FOR PRESENTING ENERGY-MANEUVERABILITY INFORMATION DURING SIMULATED CLOSE COMBAT c06

D. N. Jarrett *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 10 p refs (For primary document see N82-13048 04-01)

Avail: NTIS HC A10/MF A01

Since continuous visual contact display (HMMD) with the enemy is essential in close combat the provision of this information on a helmet-mounted diplay (HMMD) may be particularly useful. However, the (in) visibility of the image against a bright sky background, the increased helmet weight and other inconveniencing counter effects when coupled with the high attentional and physical demands of combat, may obviate any advantages of controlling the aircraft using the extra information. A series of exercises was set up to assess the HMMD in this application. The device was the subject of a flight trial in a light jet aircraft, and two studies were completed in the newly-commissioned RAE air combat simulator. These studies enabled pilots to become familiar with the device and the unusual display format, in order to assess their combined usefulness in a combat context. A.R.H.

N82-13062# Naval Air Test Center, Patuxent River, Md.

EVALUATION OF A PILOT WORKLOAD ASSESSMENT DEVICE TO TEST ALTERNATE DISPLAY FORMATS AND CONTROL HANDLING QUALITIES c54

Samuel G. Schiflett, Paul M. Linton (Naval Air Development Center, Warminster, Pa.), and Ronald J. Spicuzza (Systems Research Labs., Inc., Dayton, Ohio) *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 12 p refs (For primary document see N82-13048 04-01)

Avail: NTIS HC A10/MF A01

The utility of a workload assessment device to measure pilot workload for approach and landing formats and control stability variations was tested in in a modified NT-33 research aircraft. The feasibility of using an item-recognition task as a measure of sensory-response loading and reserve information processing capacity while flying precision approaches was established. Statistical treatment of the data indicates an appreciable increase in reaction time and errors with degraded handling qualities as compared to ground baseline measures and good handling qualities. The preliminary findings also reveal consistent trends toward the availability of more mental reserve capacity when flying predominantly pictorial/symbolic HUD configurations as compared to conventional HUD formats with scales and alphanumerics. A.R.H.

TANKER AVIONICS AND AIRCREW COMPLEMENT EVALUATION c06

Richard W. Moss and Gregory J. Barbato (Bunker-Ramo Corp., Dayton, Ohio) *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 18 p refs (For primary document see N82-13048 04-01)

Avail: NTIS HC A10/MF A01

A four phase effort addressing the control and display design issues associated with operating the SAC'S KC-135 tanker without the navigator crew position is discussed. Topics covered include the mission analysis phase during which the tanker's operational responsibilities were defined and documented; the design phase durng which alternative crew station design concepts were developed; the mockup evaluation phase which accomplished initial SAC crewmember assessment of cockpit designs; and the simulation phase which validated the usability of the crew system redesign. A recommended crew station configuration is examined and some of the philosophy underlying the selection of cockpit hardware and systems is discussed. A.R.H.

N82-13064# McDonnell Aircraft Co., St. Louis, Mo.

F/A 18 HORNET CREW STATION c06

Eugene C. Adam *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 6 p (For primary document see N82-13048 04-01)

Avail: NTIS HC A10/MF A01

The Hornet crew station design requirement was to essentially provide the capability contained in both the F-4 and A-7 weapon systems so as to perform both the fighter attack roles, make it operable by one pilot, and increase mission reliability by a combination of improved hardware reliability and functional redundancy. To put this requirement in perspective, the F/A-18 cockpit has 40% less usable area than any of its contemporaries. This area constraint necessitated extensive integration of the weapon system controls and displays. The resultant crew station features four miltipurpose cathoderay displays driven by two mission computers, an integrated upfront control panel, and numerous automatic functions on the stick and throttle. The rationale leading up to the configuration is described and a few examples of the one-man-operability features of the Hornet and how they would used by the pilot are presented. A.R.H.

PERFORMANCE OF HIGHLY INTEGRATED INLETS FOR SUPERSONIC AIRCRAFT

c02
Lewis Surber, Jan Syberg, and Joseph Koncsek *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 12 p refs Prepared in cooperation with Boeing Military Airplane Co., Seattle (For primary document see N82-13065 04-01)
Avail: NTIS HC A22/MF A01

Performance data obtained on several subsonic diffusers applicable to advanced supersonic tactical aircraft configurations were used to select a forebody-inlet model for proof-of-concept wind tunnel performance evaluation. Three of the diffusers were designed for high aspect ratio inlets having throat aspect ratios greater than seven. A fourth design incorporated a low aspect ratio inlet. Two of the high aspect ratio diffusers and the low aspect ratio diffuser incorporated duct bends typical of inlets substantially offset from the engine centerline. Preliminary tests of the high aspect of ratio diffuser produced high total pressure recovery coupled with relatively low flow distortion. Furthermore, the use of longitudinal vanes in one high aspect ratio diffuser provided reductions in engine face flow distortion with very little performance degradation. Proof-of-concept tests further investigated the performance of a high aspect ratio, side-mounted external compression supersonic inlet. Tests were performed in a 16-foot supersonic propulsion wind tunnel at Mach numbers of 1.6 to 2.2 over a -5 to 12 deg angle of attack range and sideslip angles from -8 to +8 deg. The results of these tests support the use of high aspect ratio inlets with sharp duct bends as a viable design option in future supersonic aircraft designs.

TOP-MOUNTED INLET SYSTEM FEASIBILITY FOR TRANSONIC-SUBSONIC FIGHTER AIRCRAFT APPLICATIONS

c02
T. L. Williams, B. L. Hunt, D. B. Smeltzer, and W. P. Nelms *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 17 p refs Prepared in cooperation with Northrop Corp., Hawthorne, Calif. (For primary document see N82-13065 04-01)
Avail: NTIS HC A22/MF A01 CSCL 01A

To inlet flow field and engine inlet performance data for an advanced fighter aircraft configuration were obtained over the Mach 0.6 to 2.0 range. The studies not only provided extensive data for the baseline arrangement, but also evaluated the effects of key aircraft configuration variables (inlet location, canopy-dorsal integration, wing leading-edge extension planform area, and variable incidence canards) on top inlet performance. In order to set these data in the context of practical aircraft systems top inlet performance is compared with that of more conventional inlet/airframe integrations. The results of these evaluations show that, for the top inlet configuration tested, relatively good inlet performance and compatibility characteristics are maintained during subsonic and transonic maneuver. However, at supersonic speeds, flow expansion over the forebody and wings causes an increase in local inlet Mach number subsequently reduces inlet performance levels. These characteristics infer that although top inlets many not pose a viable design option for aircraft requiring a high degree of supersonic maneuverability, they have distinct promise for vehicles with subsonic and transonic maneuver capabilities.

SOME RAE RESEARCH ON SHIELDED AND UNSHIELDED FUSELAGE MOUNTED AIR INTAKES AT SUBSONIC AND SUPERSONIC SPEEDS

c02
J. A. Ross, I. McGregor, and A. J. Priest *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 16 p refs (For primary document see N82-13065 04-01)
Avail: NTIS HC A22/MF A01

The incidence performance of fuselage-mounted intakes at subsonic and supersonic speeds is examined. The effects of simple changes in intake geometry, such as increasing contraction ratio and altering lower lip shape, are first considered; it is shown that such modifications can be beneficial at subsonic speeds, but drag penalties tend to limit their use at higher Mach numbers. Two intake locations that potentially offer a good degree of incidence shielding - underfuselage and understrake - are then examined. It is concluded that satisfactory performance can be obtained with an understrake installation, but a detailed study of strake shape, slots, splitter plates and boundary layer diverters must be made if the combinaion is to be successful over the whole of the intended flight envelope. However, for the configurations tested, the underfuselage location offers generally better intake performance lower technical risk. Finally, some results for a side-mounted staggered lip intake are presented, together with some two dimensional calculations of the mutual interference effects that occur between the upper and lower lips. It is suggested that an intake of this type can be competitive with an underfuselage installation.

PREDICTION AND MEASUREMENT OF TIME-VARIANT, THREE-DIMENSIONAL FLOWS IN MILITARY AIRCRAFT INTAKES

c02
D. E. Colbourne and J. E. Flitcroft *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 18 p refs (For primary document see N82-13065 04-01)
Avail: NTIS HC A22/MF A01

The development of a computational method suitable for predicting the three dimensional flows within the diffuser sections of aircraft intakes is described. A fast method for automatic grid generation, application to ducts of any smoothly varying cross-sectional shape, is discussed. The development of a finite-volume, time-marching method for solving the flow equations is also described. The validity of the chosen techniques is discussed in the light of comparisons with analytical and empirical results. Empirical techniques were developed to examine flows in which viscous or time variant effects are dominant. A rotating yaw meter rake was developed to undertake detailed flow surveys at the exit of model diffusers, and results may be obtained from tests both in isolation and in the presence of a compressor. The development of instrumentation and data processing facilities for measuring instantaneous engine face total pressure distortion in small scale models is also described, together with the validation of this technique by comparison with results from a full-size replica of the intake tested under free-jet conditions. M.G.

EFFECTS OF INTAKE GEOMETRY ON CIRCULAR PITOT INTAKE PERFORMANCE AT ZERO AND LOW FORWARD SPEEDS

c02
A. C. Willmer, T. W. Brown, and E. L. Goldsmith (RAE, Bedford, England) *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 16 p refs Sponsored in part by Ministry of Defence (For primary document see N82-13065 04-01)

Avail: NTIS HC A22/MF A01

A series of experiments on circular cross-section pitot intakes at Mach numbers from 0 to 0.21 and angles of incidence and sideslip from 0 to 40 deg are presented. Measurements were made at the engine face of 72 pitot pressures, 4 unsteady pitot pressures, swirl angle at six positions, and boundary layer profiles at four positions. Static pressure distribution around the cowl lips and along the diffusers were also measured. Five cowl lips covering a range of contraction ratios and lip shapes were tested with both a straight and an S bend diffuser. The effect of inserting parallel section spacers between the cowl lip and the front of the subsonic diffuser and between the end of the subsonic diffuser and the engine face instrumentation and the effect of a thin lip slot upstream of the intake throat were evaluated. Results indicate that, lip losses may be decreased by increasing contraction ratio, fitting a lip slot or a forward spacer. Steady state flow distortion at the engine face is decreased by increasing lip contraction ratio or by fitting an aft extension. For the S duct tested, distortion levels are set by the diffuser as much as by incidence. Sideslip, however, lessens the distortions. M.G.

TRANSONIC FLOWS IN AN AIR INLET WITH LARGE INCIDENCE AND THE EFFECT OF A BLOWING TRAP [ECOULEMENTS TRANSSONIQUES DANS UNE PRISE D'AIR EN GRANDE INCIDENCE AT EFFET DE TRAPPE DE SOUFFLAGE] c02

A. Dyment, P. Gryson, and J. P. Flodrops *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 13 p ref In FRENCH (For primary document see N82-13065 04-01)

Avail: NTIS HC A22/MF A01

Flow in a bidimensional air intake with large incidence was studied under conditions in which the upstream flow was subsonic and the internal flow could be regulated. The phenomena following flow separation were examined, especially the homogenization of the internal flow. A device for improving mogenization which involves a natural deflection accomplished by a scoop designed to guide the captivated air was tested. The universal aspect of internal flow was studied using probes in different sections. The unsteady phenomena were analyzed from ultra high speed visualizations and the mean flow was characterized from classic visualization. The insertion of the deflector appreciably improved the performance of the air intake. The coefficient of output (sigma) and the total mean pressure (P sub tm) were considerably improved at the level of the compressor. While the use of the scoop to guide the air towards the slot had only a weak influence on sigma and P sub tm at the compressor level, it brought an appreciable gain in the speed of homogenization of the internal flow. CALCULATION OF TRANSONIC AIR-INTAKES USING A COMPUTER PACKAGE FOR INVISCID AND BOUNDARY LAYER FLOWS c02

Ciro W. Lucchi *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 4 p refs (For primary document see N82-13065 04-01)

Avail: NTIS HC A22/MF A01

A finite-element method was developed to solve the full potential equation for transonic flows in a two dimensional engine intake. Since the full potential equation is expressed in the psi-formulation, a successive line over-relaxation algorithm was developed to solve the system of non-linear algebraic equations. Stability in the supersonic domain was obtained using Hafez's artificial compressibility method. Herring-Mellor's finite-difference code was incorporated to compute two dimensional compressible laminar-turbulent boundary layers. A fixed transition or Dunham's transition criterion may be chosen. The inviscid method was tested on a few single profiles, such cases having been computed exhibiting difficulties expected to occur in the calculation of two-dimensional intakes: high leading-edge suction peaks and strong shocks. Computations carried out on a two dimensional Tornado-like air-intake are discussed. A.R.H.

SUBSONIC MILITARY AIRCRAFT ENGINE INTAKE: AN INTEGRATED THEORETICAL EXPERIMENT DESIGN c02

G. Bertolone and L. Fornasier *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 17 p refs (For primary document see N82-13065 04-01)

Avail: NTIS HC A22/MF A01

Two numerical codes were developed for the simulation of the engine intake-induced flow field in two dimensional transonic and three dimensional subsonic cases. Both codes were obtained by modification of existing codes suitable for the computation of the exterior flow past airfoils (by a finite element method) and about three dimensional arbitrary configurations (by a panel method). Computed results and comparison with experimental data pertinent to the analysis of a single bifurcated intake proved usefulness of the present numerical schemes for engineering applications. Engine face auxiliary doors design and side intakes diverter shape optimization was studied. Following an extensive testing program performed on a static model, the engine face auxiliary doors with annular air admission into the primary long type duct appeared to be a good alternative to the classical solution placed at the main inlet entry. Diverter geometry influence both on aerodynamics, in terms of drag coefficient, and intake performance, in terms of distortion coefficient, was investigated by testing a low speed model. R.J.F.

INTEGRATION OF ADVANCED EXHAUST NOZZLES c07

Douglas L. Bowers and James A. Laughrey *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 14 p refs (For primary document see N82-13065 04-01)

Avail: NTIS HC A22/MF A01

Attributes of both axisymmetric and nonaxisymmetric advanced nozzles and their incorporation into an aircraft to improve cruise performance, maneuverability and short takeoff and landing operation are discussed. It was concluded that when used as a trimming device, advanced exhaust nozzles with thrust vectoring can provide significant aircraft cruise drag reduction. The aftbody/nozzle installation for advanced airframes and exhaust nozzles must be approached very carefully to demonstrate an installed drag benefit. For maneuver, advanced thrust vectoring exhaust nozzles show advantages at high angle of attack. Improved turn rate and instantaneous maneuver performance can be provided by utilizing these advanced exhaust nozzles in advanced aircraft. For short takeoff and landing aircraft advanced exhaust nozzles with both thrust vectoring and thrust reversing may be necessary. Thrust vectoring up to 60 degrees (or higher) and a propulsive lift control system may be required. R.J.F.

THE SUBSONIC PERFORMANCE OF PRACTICAL MILITARY VARIABLE AREA CONVERGENT NOZZLES c07

L. R. Harper IN AGARD Aerodyn. of Power Plant Installation Sep. 1981 11 p refs (For primary document see N82-13065 04-01)

Avail: NTIS HC A22/MF A01

Performance considerations involved in the selection of a variable area nozzle for reheated engines for combat aircraft are discussed. The main emphasis is on dry operation at subsonic speeds since drag, weight, leakage and other penalties in this regime can prevent an aircraft attaining its design radius of action. Zero-base nozzles are compared with a moving shroud nozzle which has a substantial annular base area in dry setting. The moving shroud nozzle, as used on the RB199 engine in the Tornado MRCA, is very competitive with zero base nozzles in terms of overall performance. It is light, mechanically simple, reliable, and its short length permits a target type thrust reverser to be used. It is concluded that this type of nozzle is the optimum choice for combat aircraft until further technology advances permit substantial improvements in the overall performace of the more sophisticated nozzles. COMPARISON OF DIFFERENT NOZZLE CONCEPTS FOR A REHEATED TURBOFAN c07

H. Grieb, R. Vedova, H. Enderle, and H. Nagel *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 15 p refs Sponsored in part by German Ministry of Defence (For primary document see N82-13065 04-01)

Avail: NTIS HC A22/MF A01

Several concepts of convergent and convergent/divergent nozzles are investigated and compared in view of performance, weight, complexity and the influence on afterbody drag of combat aircraft. The influence of different nozzle cooling concepts on thrust, with subsequent cooling air requirements, is investigated. The optimum ratio of exit area/throat area of convergent/divergent nozzles dependent on nozzle concept and nozzle pressure ratio is identified. The performance comparison shows that fully variable convergent/divergent nozzles promise some advantages against the simple convergent nozzle at high nozzle pressure ratios. However, the higher weight and complexity of convergent/divergent nozzles lead to the conclusion that the choice of convergent/divergent nozzles for reheated turbofan engines in combat aircraft is not generally justified. J.D.H.

ADVANCED EXHAUST NOZZLE TECHNOLOGY c07

Ronald J. Glidewell and Robert E. Warburton (Pratt and Whitney Aircraft Group, West Palm Beach, Fla.) *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 11 p refs (For primary document see N82-13065 04-01)

Avail: NTIS HC A22/MF A01

Turbine engine exhaust nozzle technology, including nonaxisymmetric nozzles, thrust reversing, and thrust vectoring was investigated. Trade studies to determine the impact of these developments on the thrust-to-weight ratio and specific fuel consumption of an advanced high performance, augmented turbofan engine are reported. Results are presented in a manner which provides a understanding of the sources and magnitudes of differences in the basic elements of nozzle internal performance and weight as they relate to conventional axisymmetric nozzle technology. These comparisons are presented for three categories of nozzle functional capability: jet area and exit area control, thrust reversing, and thrust vectoring. J.D.H.

A NUMERICAL INVESTIGATION OF EXHAUST PLUME TEMPERATURE EFFECTS ON NONAXISYMMETRIC NOZZLE/AFTERBODY PERFORMANCE c07

K. M. Peery (Boeing Military Airplane Co., Seattle) and D. L. Russell *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 11 p refs (For primary document see N82-13065 04-01) (Contract F33615-79-C-3018)

Avail: NTIS HC A22/MF A01

A two dimensional Navier-Stokes flow analysis procedure is used to simulate the single expansion ramp nozzle (SERN) flow field in an attempt to understand the effect of exhaust total temperature on the nozzle flow field. Steady state solutions were obtained using an explicit time-dependent method utilizing efficiency-improvin techniques such as body-fitted mesh, coupled computational regions, wall functions, automatic alignment of mesh with mixing layers, and vectorized execution on a CRAY I computer. The temperature-dependent specific heat capacities and the effect of exhaust total temperature on the nozzle flow characteristics. A normal shock on the expansion ramp was evident in the SERN experimental data that was not predicted with the 2-D analysis. This shock was present whether the exhaust total temperature was hot or cold and its position was dependent on the total temperature. The capabilities and some of the problems of applying Navier-Stokes flow analysis procedure to computing viscous nozzle flows are demonstrated. The importance of measuring upstream conditions in flow experiments is emphasized if the data is to be utilized for explanation of flow variations which occur or for flow analysis validation. J.D.H.

A REVIEW OF THE EFFECT OF REYNOLDS NUMBER ON AFTERBODY DRAG c02

O. M. Pozniak *In* AGARD Aerodyn. of Power Plant Installation Sep. 1980 21 p refs (For primary document see N82-13065 04-01)

Avail: NTIS HC A22/MF A01

The reported effects of a change in Reynolds number or boundary layer thickness on the afterbody drag of axisymmetric bodies and military type aircraft are reviewed. The significance of different Mach number regimes and of boattail steepness combinations is considered. At subsonic Mach numbers and in the absence of flow separations, significant but compensating pressure changes are found such that there is little effect on the afterbody pressure drag of complete afterbodies. In the presence of flow separations, the effects of Reynolds number tend to be small when the location of the flow separation is fixed as a result of a sudden change in the boattail contour, but on afterbodies with more continuous contours, the location of the point of separation can be affected; conflicting factors are then involved and the afterbody drag can increase or decrease by modest amounts, or remain unaffected by Reynolds number changes. Significant increases in drag for increases in Reynolds number have been consistently reported for high subsonic Mach numbers above the drag rise. J.D.H.

A DEVICE FOR SIMULATING AT A COMPRESSOR BENCH AN AIR INLET WITH LARGE INCIDENCE [DISPOSITIF DE SIMULATION AU BANC COMPRESSEUR D'UNE PRISE D'AIR A GRANDE INCIDENCE] c07

Bertrand Delahaye and Gerard Laruelle (ONERA, Chatillon, France) *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 15 p refs In FRENCH; ENGLISH summary (For primary document see N82-13065 04-01)

Avail: NTIS HC A22/MF A01

Increased maneuverability requirements for modern fighter aircraft involve an extensive inlet-engine compatibility analysis. Therefore, during the early stages of compressor development, the engine designer must estimate the surge margin loss resulting from inlet dynamic distortion over the complete flight envelope. A bell-mouth with varying lip thickness and a level-edged duct were designed to simulate the large vortices generated in an inlet at high angle of attack in a compressor test facility; the simulator was tested in a wind tunnel at ONERA and validated in a compressor test facility at SNECMA's Villaroche test center. The flow at the inlet/engine interface plane was characterized in the wind tunnel both for a 1/4 scale cylindrical duct at a Mach number of 0.6 and angles of attack up to 40 degrees and for different versions of the simulator in static conditions. Thereafter, a 30 degree level edged duct was tested at SNECMA with a full scale transonic fan stage. Scaling rules for acquisition time and frequency are used to compare the measurement in front of the fan with the results obtained in the subscale wind tunnel model. Author

AN ACQUISITION AND ANALYSIS SYSTEM FOR DYNAMIC TESTS OF AIR INLETS [SYSTEME D'ACQUISITION ET D'ANALYSE POUR ESSAIS DYNAMIQUES D'ENTREES D'AIR] c07

Pierre Perrier, Bertrand Delahaye (SNWCMA, Moissy Cramayel, France), and Gerard Laruelle (ONERA, Chatillon, France) *In* AGARD Aerodyn. of Power Plant Installation Aug. 1981 14 p refs In FRENCH (For primary document see N82-13065 04-01)

Avail: NTIS HC A22/MF A01

Improving the flight domain of combat aircraft leads to operations involving a much large variation of unsteady aerodynamic characteristics at the engine inlet than in the past. To determine if the augmentation will be effectively acceptable for compressors and engines of the future, sufficient knowledge of flows must be acquired. This entails measuring a sufficient number of unsteady flow characteristics; however, the number of measurements made must be limited because of cost as well as because of the possibility of instantaneous or deferred processing. This sequence of measurements takes into account necessary compromises. Cooperation is needed among the aircraft designer, the engine designer, and the research organization so that the work of each can complement that of the others, and an economy of means and a homogeneity of methods for analyzing and interpreting the results is possible. A SYNTHESIS METHOD FOR ESTIMATING MAXIMUM INSTANTANEOUS INLET DISTORTION BASED ON MEASURED INLET STEADY STATE AND RMS PRESSURES c02

Ronald Borg *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 12 p refs (For primary document see N82-13065 04-01)

Avail: NTIS HC A22/MF A01

A synthesis method based on steady state and root mean square (RMS) pressure measurements was developed using a simple mathematical computer model which estimates the maximum value of an engine distortion index. The estimated values obtained with the computer model were correlated with actual measured maximum instantaneous distortion values from several different tests and it is indicated that the method is useful in a inlet airframe engine configuration development program. The method is a tool for screening configurations before final selection and commitment to more expensive testing. The synthesis method is also complemented with extreme value analysis of the computer generated distortion data to evaluate the likely increase in maximum distortion index with increased time of observation. MODEL TESTING TECHNIQUES FOR MEASURING INLET DRAG c02

James S. Holdhusen and James L. Grunnet *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 8 p refs (For primary document see N82-13065 04-01)

Avail: NTIS HC A22/MF A01

Two methods of measuring inlet drag in transonic flow are described. In the first method, a flow through nacelle is tested in a transonic wind tunnel. Capture ratio is varied by installing individual annular blockers in the nacelle. Corrections for the drag force exerted by the captured streamtube are determined from blow through tests in a static test stand. In the second method, drag is determined directly using a special rig which has a variable loss throttle. The thrust exiting the control surface is determined by a choked ASME nozzle. The advantages and disadvantages of the two methods are compared. E.A.K.

COMPRESSOR STALL INDUCING INSTALLATION EFFECTS OF AN ENGINE CONTROL PARAMETER FOR THE CF-5 AIRCRAFT c07

W. L. Macmillan, D. M. Rudnitski, and W. Grabe *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 17 p Prepared in cooperation with National Research Council of Canada, Ottawa (For primary document see N82-13065 04-01)

Avail: NTIS HC A22/MF A01

Compressor stall problems with CF-5 aircraft powered by two J85-CAN-15 engines were investigated. One major cause for compressor stalls as improper operation of the engines' control system under low temperature conditions was identified. It is demonstrated that this control system malfunction is the result of engine installation effects, which produce an erroneous compressor inlet temperature signal to the main fuel control unit. The degree of signal error for several flight conditions, such as level flight, high angles of attack, aircraft stalls, and weapons delivery profiles are identified. It is found that temperature errors are greater at high angles of attack where severe compressor inlet distortion acts cumulatively in reducing the stall margin under this flight condition. E.A.K.

THE ROLE AND IMPLEMENTATION OF DIFFERENT NACELLE/ENGINE SIMULATION CONCEPTS FOR WIND-TUNNEL TESTING IN RESEARCH AND DEVELOPMENT WORK ON TRANSPORT AIRCRAFT c02

B. Ewald and R. Smyth *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 35 p refs (For primary document see N82-13065 04-01)

Avail: NTIS HC A22/MF A01

Different experimental methods and their specific roles in various stages of research and development were investigated. The main problem is the simulation and calibration of the propulsion system. Different simulation methods are: flow through nacelles, powered nacelles (blowing, turbine powered simulators (TPS), ejector powered), inlet models. The TPS represent the most advanced simulation of the high bypass ratio engine in model scale. A large part of the wind tunnel tests still have to rely upon flow through nacelles. A novel flow through nacelle with a variable plug is presented. It is shown that the combination of flow through nacelles and TPS can be efficiently used in the windtunnel investigation of propulsion system effects for transport aircraft. E.A.K.

WIND TUNNEL TEST AND ANALYSIS TECHNIQUES USING POWERED SIMULATORS FOR CIVIL NACELLE INSTALLATION DRAG ASSESSMENT c02

A. E. Harris and E. C. Carter *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 16 p refs (For primary document see N82-13065 04-01)

Avail: NTIS HC A22/MF A01

Full span and semi-span wind tunnel model tests and powered nacelle calibration techniques are discussed in the context of civil nacelle installation drag assessment and optimization. In order to achieve the accuracy required for drag analysis it is necessary to determine the installed net thrust of the powered nacelle simulator to the equivalent of at least one aircraft drag count. This implies stringent control of mass flow and thrust accounting and imposes the need for consistency of approach in the wind-on and calibration tests where thrust and mass flow coefficients must be known to 0.1% to 0.2% accuracy. This need for high confidence in the data at all stages of analysis led to a methodology in which the measured data is combined in various ways to enhance confidence in its final use. Experiences obtained in the use of a Mach simulation tank (MST) for the calibration of turbine powered simulator units are discussed. The MST is used to obtain simultaneous mass flow and thrust calibrations with representative internal nacelle conditions in the presence of a quiescent exhaust environment. Practical problems associated with the design of balance and airfeed arrangements are discussed along with the use of blown and turbine powered simulators. B.W.

EVALUATION OF AN EXPERIMENTAL TECHNIQUE TO INVESTIGATE THE EFFECTS OF THE ENGINE POSITION ON ENGINE/PYLON/WING INTERFERENCE c02
J. A. J. vanEngelen, B. Munniksma, and A. Elsenaar *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 13 p refs (For primary document see N82-13065 04-01)
Avail: NTIS HC A22/MF A01

A flexible experimental technique to study the effect of a variation of engine position for a range of test conditions was evaluated. In this test an underwing mounted 3/4 fancowl engine was investigated at six different positions as a free flow nacelle and as a strut mounted blown nacelle. Pressure and balance force measurements were made. Some typical aspects of the aerodynamic interference are discussed, notably the value of free flow nacelle measurements. Also a comparison of balance weighed and integrated pressure forces is presented. Results indicate that accurate simulation of the engine nozzle geometry is of prime importance for an investigation concerning engine/airframe integration. Nevertheless, tests on a free flow nacelle may still be useful for the selection of the most favourable engine position. A reasonable correlation was established between interference forces as obtained from pressure integration and balance measurements. However, the pressure forces tend to underestimate the balance forces. For a flexible pathfinder test, interference forces derived from pressure integration only appear to be very useful for the determination of trends in interference effects. B.W.

THE INFLUENCE OF CLOSED-COUPLED, REAR FUSELAGE MOUNTED NACELLES ON THE DESIGN OF AN ADVANCED HIGH SPEED WING c05
R. D. Laugher *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 17 p refs (For primary document see N82-13065 04-01)
Avail: NTIS HC A22/MF A01

The design approach aimed at integrating the effect of the nacelle into the basic wing design is described. Particular attention is drawn to the design risk associated with the modified inner wing supercritical flow development when nacelles are not represented in the transonic design calculations. Experimental test results are described which demonstrate the general success of the design technique. Finally, some results are presented from theoretical investigations in which an attempt was made to simulate the interference effect of the nacelle on the wing supercritical flowfield. A technique was developed whereby the nacelle and intake streamtube are replaced by an equivalent interfering body, which is derived from subcritical flow interference pressures. Results show that this technique provides a simple, cost effective tool for the supercritical design of a wing operating in the influence of a rear nacelle. M.D.K.

AERODYNAMIC ASPECTS OF A HIGH BYPASS RATIO ENGINE INSTALLATION ON A FUSELAGE AFTERBODY c02
N. Voogt, J. vanHengst, and J. Th. v.d.Kolk (NRL) *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 10 p refs (For primary document see N82-13065 04-01)
Avail: NTIS HC A22/MF A01

The design process used in shaping rear fuselage mounted large diameter engine nacelles, pylons, and fuselage for a transport type aircraft is described. The objective was to suppress the local velocity levels and pressure gradients to avoid aerodynamic interference drag of the nacelle-pylon-fuselage combination in high speed cruise flight. Shapes of fuselage afterbody, nacelle, and stubwing were modified in a design-by-analysis process involving iterative and three dimensional singularity methods for inviscid subsonic flow. Windtunnel tests confirmed the adequacy of these methods. M.D.K.

A NUMERICAL METHOD FOR STUDYING NACELLE-JET-AIRFOIL INTERACTION IN INVISCID THREE-DIMENSIONAL FLOW [UNE METHODE NUMERIQUE POUR L'ETUDE DE L'INTERACTION NACELLE-JET-VOILURE EN ECOULEMENT TRIDIMENSIONEL NON VISQUEUX] c02
G. LeGall, J. Bousquet, and M. Yermia *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 13 p refs In FRENCH (For primary document see N82-13065 04-01)
Avail: NTIS HC A22/MF A01

The nacelle-jet-airfoil interaction is a complex three dimensional phenomena which is addressed in two simplified hypotheses: the fluid is incompressible and inviscid. Under these two hypotheses, the propulsive configuration is modeled by air intake with flow control and a propulsive jet with control of the pressure generator. A method of singularities is used which considers the sources and doublets of constant density and doublets of linear density on a flat panel. The equations which govern the problem constitute a nonlinear system which is divided into a linear part and a quadratic part. These two parts are solved iteratively by the Gauss-Seidel method and the Newton method. The free boundaries of the flow are also calculated by an iterative process which is integrated into the two preceding methods. Some practical results are proposed in two and three dimensional flow. Comparison with tests permits evaluation of the advantage of the simplified hypotheses. Transl. by A.R.H.

CALCULATION OF WING-BODY-NACELLE INTERFERENCE IN SUBSONIC AND TRANSONIC POTENTIAL FLOW c02
K. D. Klevenhusen, H. Jakob, and H. Struck *In* AGARD Aerodyn. in Power Plant Installation Sep. 1981 8 p refs (For primary document see N82-13065 04-01)
Avail: NTIS HC A22/MF A01

A calculation method especially for transport aircraft wing design with consideration of wing/body or engine/airframe interference was developed. A hybrid method, consisting of a combination of panel method and finite difference method, is an improvement of a well proved analogy method. The panel method is of higher order using linear source and doublet distributions. The transonic flow region is removed from the entire flow field and the panel method is used for calculating boundary values for the subsequent finite difference method. The finite difference method solves the full potential equation in streamline coordinates. E.A.K.

A numerical procedure to calculate the flow fields resulting from the viscous inviscid interactions that occur when a strong jet exhaust and aircraft flow field coupling exists was developed. The approach divides the interaction region into zones which are either predominantly viscous or inviscid. The flow in the inviscid zone, which surrounds most of the aircraft, is calculated using an existing potential flow code. The viscous flow zone, which encompasses the jet plume, is modeled using a parabolized Navier-Stokes code. The procedure features the coupling of the zonal solutions such that sufficient information is transferred between the zones to preserve the effects of the interactions. The zonal boundaries overlap and the boundary conditions are the information link between zones. An iteration scheme iterates the coupled analysis until convergence has been obtained. E.A.K.

The aerodynamic installation features of a highly loaded turboprop (prop fan) on an aircraft for flight at Mach 0.8 are discussed. The aerodynamic flow environment in which the prop fan must operate is shown for both wing and aft-fuselage installations using advanced surface panel methods. The effects of prop fan slipstream parameters on the drag of a supercritical wing are presented indicating that only small drag penalties occur. Drag reductions are possible by tailoring the local wing section to account for the rotor induced flow. Using these inputs, an integrated wing/nacelle is shown. E.A.K.

(Contract NAS1-14623)
Avail: NTIS HC A22/MF A01 CSCL 02A

The transonic speed regime for airplanes at conditions where inlet spillage takes place is discussed. A wind tunnel test program to evaluate aerodynamic performance penalties associated with propulsion system installation and operation at subsonic through low supersonic speeds was conducted. The accuracy of analytic methods for predicting transonic engine airframe interference effects was assessed. Study variables included Mach number, angle of attack, relative cells location, and nacelle mass flow ratio. Results include test theory comparisons of forces as well as induced pressure fields. Prediction capability of induced shock wave strength and locations is assessed. It was found that large interference forces due to engine location and flow spillage occur at transonic speeds, that theory explains these effects; and that theory can predict quantitatively these effects. E.A.K.

A NUMERICAL STUDY OF LAMINAR UNSTEADY COMPRESSIBLE FLOW OVER AIRFOILS Ph.D. Thesis
Mohamed M. El-Refaee 1981 199 p
Avail: Univ. Microfilms Order No. 8124290

An integro-differential formulation for the numerical solution of the two dimensional compressible subsonic-Navier-Stokes equations is developed and presented. This formulation utilizes vorticity and dilatation as dependent variables in the govering equations. In contrast to the prevailing finite-difference techniques, the formulation is capable of confining the computations to the region of non-negligible vorticity and non-negligible difference in dilatation between the viscous flow and the potential flow around the same configuration. The accuracy and flexibillity of the scheme are demonstrated by considering three test cases involving bodies of simple geometries. The numerical results are compared with available experimental data and finite difference solutions. Laminar compressible flow past a 9 percent thick Joukowski airfoil at 15 deg angle of attack is analyzed. The 'steamline like' lines in the compressible case show the appearance of a primary bubble. Dissert. Abstr.

SOME OBSERVATIONS OF SURFACE PRESSURES AND THE NEAR WAKE OF A BLUNT TRAILING EDGE AIRFOIL Ph.D. Thesis
Ramarao Venkata Digumarthi 1981 191 p
Avail: Univ. Microfilms Order No. 8124053

Experiments with a truncated and untruncated airfoils of profiles NACA 640A10 were carried out in subsonic wind tunnels in a velocity range of 19 meters per second to 54 meters per second corresponding to Reynolds numbers of 2.0 x 10 to the 5th power to 4.68 x 10 to the 5th power based on the chord. Airfoil spanned the test section to achieve two dimensionality of the model. Chordwise static pressure distribution of the blunt trailing edge airfoil agreed with that for a smooth trailing edge airfoil except at the vicinity of the trailing edge. The boundary layer profiles in the midspan plane showed no separation as in the case of the smooth trailing edge airfoil. The spanwise distribution of the static pressure with tripped boundary layer, was found to be uniform on the upper surface of the airfoil, was found to be nonuniform as the trailing edge was approached for an untripped boundary layer configuration. Vortex shedding occurred behind blunt trailing edge airfoils and varied linearly with velocity. Although the intensity (RMS) of the base fluctuating pressure showed negligible variation in the spanwise direction, cross-correlations indicate spanwise phase variation in the base pressure. Dissert. Abstr.

NAVIER-STOKES SOLUTIONS FOR A SUPERSONIC COFLOWING AXISYMMETRIC NOZZLE WITH A THICK ANNULUS Ph.D. Thesis
Gerald Alan Hasen 1981 158 p
Avail: Univ. Microfilms Order No. 8119138

A numerical technique is developed that is capable of accurately predicting supersonic coflowing nozzle flowfields which contain both highly viscous regions and complex shock structures typified by the Mach disc formation. Numerical solutions to the Navier-Stokes equations are obtained for a domain containing an axisymmetric coflowing nozzle with a thick base annulus. The coflowing nozzle streams consist of a Mach 3.0 jet embedded in a Mach 1.94 turbulent external flowfield. Five nozzle pressure ratio conditions ranging from a highly overexpanded case which exhibits a Mach disc shock formation, to a slightly under-expanded case are examined and solved numerically. An efficient Lax-Wendroff type differencing scheme of second order accuracy which utilizes time-splitting and two-step predictor corrector techniques is used to solve the two dimensional Navier-Stokes equations. An adaptive grip scheme is utilized in the wake of the nozzle base annulus. A fully vectorized version of the present computer code can be expected to converge within five minutes on a CRAY-1 computer. Dissert. Abstr.

N82-13102 Georgia Inst. of Tech., Atlanta.
AN EXPERIMENTAL INVESTIGATION OF THE TURBULENT FLOW IN THE JUNCTION OF A FLAT PLATE AND A BODY OF CONSTANT THICKNESS Ph.D. Thesis
Ergun Abdullah Oguz 1981 208 p
Avail: Univ. Microfilms Order No. 8124294

The incompressible turbulent flow in the streamwise junction formed by a body of constant thickness, with a semielliptic leading edge, and an effectively infinite flat plate are investigated for two values of the flat plate upstream boundary layer thickness. In order to identify the magnitude and extent of the distortion of the mean flow and the turbulence field that is associated with the secondary flow system, total pressure, surface pressure, yaw angle, and mean, and fluctuating velocity measurements (in the direction of the local mean velocity vector) are conducted at three streamwise stations. The local yaw angles are determined utilizing the single hot wire rotation technique. A vortex-like secondary flow system in the junction operating in a sense with the flow moving away from the body near the plate surface and towards the body in the outer part of the junction flow region is observed. Dissert. Abstr.

N82-13103 Florida Univ., Gainesville.
REFINEMENT OF A METHOD FOR DETERMINING THE INDUCED AND PROFILE DRAG OF A FINITE WING FROM DETAILED WAKE MEASUREMENTS Ph.D. Thesis
Robert Paul Weston 1981 302 p
Avail: Univ. Microfilms Order No. 8124463

The drag of a moderate aspect ratio wing into profile and induced drag components is considered. The axial flow in the trailing vortex system suggests that a portion of the overall drag that is currently attributed to profile drag is actually linked to the trailing vortex strength and should be associated with the induced drag component. This drag portion, designated as the vortex core drag increment, is estimated near the wing. A diffuse vortex model is proposed as a way of determining the vortex core drag increment from transverse velocity measurements in downstream cross sections of the wing wake. The sum of the integrated profile and induced drag values obtained from wake measurements show agreement with the total drag values obtained from force balance measurements. Dissert. Abstr.

N82-13104 Iowa Univ., Oakdale.
TURBULENT WAKE DEVELOPMENT BEHIND STREAMLINED BODIES Ph.D. Thesis
Sastry Suryanarayana Munukutla 1981 316 p
Avail: Univ. Microfilms Order No. 8123346

The developing turbulent wake behind streamlined bodies is reported. Detailed measurements of mean and turbulent flow properties are made in three different wake flows. The first is the symmetric wake of a flat plate, the second is the asymmetric wake of a flat plate, (asymmetry being produced by roughening on side of the plate) and the third is the curved wake of an asymmetric airfoil at incidence. It is possible to identify three important regions in the wake, namely the near wake, intermediate wake and the far wake. The performance of the existing turbulence models in the case of the symmetric flat plate wake is studied. The near and intermediate wake regions are predicted by a sophisticated turbulence model. Dissert. Abstr.

N82-13105 Stanford Univ., Calif.
AN EXPERIMENTAL INVESTIGATION OF THE FLOW PAST A FINITE CIRCULAR CYLINDER AT A LOW SUBCRITICAL REYNOLDS NUMBER Ph.D. Thesis
Muhammad Umar Budair 1981 139 p
Avail: Univ. Microfilms Order No. 8124045

Results of hot-wire measurements made in the near-wake of a finite circular of fixed aspect ratio (l/D = 37) at a Reynolds number of 9955 are reported. The measurements included the mean velocity profiles, root-mean-square values of the velocity fluctuations, frequency spectra, and velocity cross-correlations. The mean velocity profiles were used to determine the wake width, whose variation in the downstream and spanwise directions was examined. It was found that the flow over the span can be characterized by four regions: (1) A tip region where vortex shedding occurs at a lower frequency than that prevalent far away from the tip. (2) An intermediate region adjacent to the first one where a frequency component of a nonshedding character is present. (3) A third region characterized by a gradually increasing shedding frequency with increasing distance from the tip. (4) A two dimensional region where the shedding frequency is constant. The propagating character of the frequency component present in region 2 was studied. Dissert. Abstr.

FORCE AND MOMENT, FLOW-VISUALIZATION, AND BOUNDARY-LAYER TESTS ON A SHUTTLE ORBITER MODEL AT MACH 6
Robert L. Calloway Dec. 1981 25 p refs
(NASA-TP-1952; L-14782) Avail: NTIS HC A02/MF A01 CSCL 01A

Force and moment, flow visualization, and boundary layer state tests were conducted using two 0.004 scale shuttle orbiter models. The force and moment tests were conducted for an angle of attack range from 20 to 40 deg and for Reynolds numbers based on reference length from 0.4 million to 3.6 million. Schlieren photographs were obtained for each angle of attack and Reynolds number. The boundary layer state tests, which were conducted using hot film sensors mounted in a separate model, were conducted over the same range of conditions as the force tests. Test results were combined to show that changes in the boundary layer on a typical hypersonic force test model affect measurement of the axial force coefficient and that the state of the local boundary layer is important for interpreting hypersonic aerodynamic test results. WIND-TUNNEL INVESTIGATION OF THE EFFECTS OF BLADE TIP GEOMETRY ON THE INTERACTION OF TORSIONAL LOADS AND PERFORMANCE FOR AN ARTICULATED HELICOPTER ROTOR
William T. Yeager and Wayne R. Mantay Dec. 1981 64 p refs Prepared in cooperation with Army Aviation Research and Development Command, Hampton, Va.
(DA Proj. 1L2-62209-AH-76)
(NASA-TP-1926; AVRADCOM-TR-81-B-5; L-14674) Avail: NTIS HC A04/MF A01 CSCL 01A

The Langley transonic dynamics tunnel was used to determine the degree of correlation between rotor performance and the dynamic twist generated by changes in blade tip geometry using an articulated rotor with four different tip geometries at advance ratios of 0.20, 0.30 and 0.35. Based on the data obtained, it is concluded that: (1) there appears to be no strong correlation between blade torsion loads and rotor performance prediction; (2) for a given rotor task at each advance ratio investigated, both the azimuthal variation of torsional moment and the mean torsional moment at 81% radius are configuration dependent; (3) reducing the nose down twist on the advancing blade appears to be more important to forward flight performance than increasing the nose down twist on the retreating blade; (4) the rotor inflow model used was important in predicting the performance of the adaptive rotor; and (5) neither rigid blade solidity effects, inflow environment, nor blade torsion loads can be used alone to accurately predict active rotor performance. CROSSFLOW EFFECTS ON STEADY AND FLUCTUATING PRESSURES ON AN OGIVE-CYLINDER CONE-FRUSTUM MODEL IN SUPERSONIC SEPARATED FLOW

Jules B. Dods, Jr. (Raman Aeronautics Research and Engineering, Inc., Palo Alto, Calif.) and Charles F. Coe Nov. 1981 58 p refs
(Contract NAS2-10139)
(NASA-TP-1951; A-8563) Avail: NTIS HC A04/MF A01 CSCL 01A

Wind-tunnel tests were conducted on an ogive-cylinder model with two axisymmetric protuberances having cone frustum angles of cone = 23 deg and 45 deg that were used to generate detached shock waves and the resulting separated flow areas downstream of the shock. The tests were conducted in a 9 by 7 foot supersonic wind tunnel at a free-stream Mach number of 2.0 and at Reynolds numbers of 1.5 x 1 million and 3.9 x 1 million, based on body diameter. The model had an afterbody fineness ratio of 8.3, and the ogive nose had a fineness ratio of 3.0. Two characteristics of the fluctuating pressures in surface vortex flows that result from the crossflow component, (velocity along the tunnel longitudinal axis free stream angle of attack), in combination with changes in the longitudinal pressure gradient were measured: (1) the broadband, rms-pressure coefficients and (2) the power spectral densities. Measurements are presented for various flow regions on the model such as the attached turbulent boundary layer, the detached frustum shock wave, and separated flow areas. The results indicate that the pressure fluctuations around or in the neighborhood of the foci of the vortex flows had broadband intensities and power spectral densities nearly identical to the levels previously measured in separated-flow regions at angles of attack of 0 deg. AN AERODYNAMIC DESIGN AND THE OVERALL STAGE PERFORMANCE OF AN AIR-COOLED AXIAL-FLOW TURBINE

Atsumasa Yamamoto, Kitao Takahara, Hiroyuki Nouse, Shigeo Inoue, Hiroshi Usui, and Fugio Mimura Jan. 1981 44 p refs
(NAL-TR-321T) Avail: NTIS HC A03/MF A01

In order to investigate air-cooled turbines for application to high-temperature engines, a single stage turbine with a 0.56-m (22-inch) tip diameter was designed. The aerodynamical design procedures of the turbine are presented. The stator and rotor blades are characterized by low blade solidity, thick blade section, blunt leading edge and trailing edge, and low blade aspect ratio. A cold air test without supply of cooling air was conducted to determine the turbine aerodynamic performance. The highest efficiency obtained over the range of conditions investigated was 0.865. The turbine satisfied the equivalent design value of specific work output at the design condition (i.e., at equivalent design speed and equivalent design pressure ratio) with an efficiency of 0.856. Detailed surveys of rotor-outlet gas flow were made with Pitot tubes and temperature sensors and the results are also presented. T.M.

FORCE MEASUREMENTS ON A REFLEX CAMBERED DELTA WING

V. S. Holla, M. D. Aravamudhan, and P. Jagadeesha Rao 23 Jul. 1981 35 p refs Backup document for AIAA synoptic scheduled for publication in Journal of Aircraft in Mar. 1982
(LOG-C4073) Avail: NTIS HC A03/MF A01

The effect of reflex spanwise camber on the lift, drag, lift to drag ratio and the pitching moment coefficients were studied on a reflex spanwise cambered slender delta wing with conical camber and a plane delta wing. At subsonic speeds, both with and without yaw, the cambered wing has less lift at a given incidence and higher lift to drag ratio at a given lift than the plane wing. At supersonic speeds, both lift at any incidence and lift to drag ratio at a given lift coefficient were less on the cambered wing than on the plane wing. Flow visualization studies at subsonic speeds show that the spanwise camber both delays and reduces the intensity and extent of the flow separation along the leading edges. At supersonic speeds, at the design Mach number and incidence, there is good agreement between results from theory and experiment. The center of pressure position of the cambered wing is ahead of that of plane wing at subsonic speeds while the reverse is true at supersonic speeds. A.R.H.

THRUST MODULATION METHODS FOR A SUBSONIC V/STOL AIRCRAFT

Richard R. Woollett 1981 18 p refs Presented at V/STOL Conf., Palo Alto, Calif., 7-9 Dec. 1981; sponsored by AIAA and NASA Ames
(NASA-TM-82747; E-1063) Avail: NTIS HC A02/MF A01 CSCL 01A

Low speed wind tunnel tests were conducted to assess four methods for attaining thrust modulation for V/STOL aircraft. The four methods were: (1) fan speed change, (2) fan nozzle exit area change, (3) variable pitch rotor (VPR) fan, and (4) variable inlet guide vanes (VIGV). The interrelationships between inlet and thrust modulation system were also investigated using a double slotted inlet and thick lip inlet. Results can be summarized as: (1) the VPR and VIGV systems were the most promising, (2) changes in blade angle to obtain changes in fan thrust have significant implications for the inlet, and (3) both systems attained required level of thrust with acceptable levels of fan blade stress. M.D.K.

THE EFFECT OF ROTOR BLADE THICKNESS AND SURFACE FINISH ON THE PERFORMANCE OF A SMALL AXIAL FLOW TURBINE

Richard J. Roelke and Jeffrey E. Haas 1982 13 p refs Proposed for presentation at the Gas Turbine Ann. Meeting, London, 18-22 Apr. 1982; sponsored by ASME Prepared in cooperation with Army Aviation Research and Development Command, Cleveland
(Contract DE-AI01-77CS-51040)
(NASA-TM-82726; DOE/NASA/51040-34; TR-81-C-29) Avail: NTIS HC A02/MF A01 CSCL 21E

An experimental investigation was conducted to determine the effect of blade profile inaccuracies and surface finish on the aerodynamic performance of a 11.13 cm tip diameter turbine. The as-received cast rotor blades had a significantly thicker profile than the design intent and a fairly rough surface finish. Stage test results showed an increase of one point in efficieny by smoothing the surface finish and another three points by thinning the blade profiles to near the design profile. Most of the performance gain between the as-cast thick and the thinned rotor blades both with the same surface finish, was attributed to reduced trailing edge losses of the recontoured blades Author

(BMVg-FBWT-79-15) Avail: NTIS HC A04/MF A01; DOKZENTBw, Bonn DM 30

An analysis which determines nonlinear force and pitching moment characteristics of slender bodies and slender wing-body configurations at high angles of attack in supersonic flow is presented. The linear coefficients of the body are calculated by means of a singularity distribution along the body axis. The nonlinear coefficients are determined by a method based on Wardlaw's multivortex model which is modified so that it is applicable at Mach > 1. The wing characteristics are calculated with the Huerlimann prediction method; this method is limited to slender, tapered wing planforms. The mutual interference of wing and body is accounted for by Nielsen interference factors. The range of application of the analysis is exemplified by sample calculations.

(BMVg-FBWT-80-11) Avail: NTIS HC A04/MF A01; DOKZENTBw, Bonn DM 30

The prediction of normal force and pitching moment of cruciform wing-body configurations at subsonic speed, high angles of attack, and arbitrary roll position by means of coefficient synthesis is discussed. The aerodynamic coefficients of the exposed wing are determined, using the vortex lattice technique, assuming that the free vortices leave the wing panels inclined by half the angle of attack. The three dimensional base flow of wing-body configurations at subsonic speed was investigated theoretically. The dividing stream surface is assumed to be closed and axisymmetric and is simulated by source-sink distributions. The influence of the base flow on body and wing is verified for different wing positions, Mach numbers and angles of attack.

INVESTIGATION OF THE VORTEX FIELD GENERATED BY AN AIRFOIL MODEL IN A WIND TUNNEL, USING ULTRASONIC PULSES

Rolf H. Engler and Dieter W. Schmidt 1979 155 p refs In GERMAN; ENGLISH summary
(MPIS-MITT-69; ISSN-0374-1257) Avail: NTIS HC A08/MF A01

The development of the tip vortex generated by a rectangular wing of aspect ratio five in the region closely behind the wing was investigated by means of ultrasonic pulses in a 3m x 3m wind tunnel. This technique does not perturb the flow field and is based on the time-of-flight variations of the ultrasonic pulses due to acceleration or deceleration by tail or head winds. Vortex position, core diameter, circumferential velocity, and circulation were measured as a function of angle of attack and of main flow velocity up to 40 m/sec at Reynolds numbers up to 400,000. The data evaluation is aided by a theoretical model based on a Hamel-Oseen vortex. The influence of spoiler configurations on the tip vortex and the near flow field upstream of the wing were also investigated. Author (ESA)

AN ANALYTICAL AND EXPERIMENTAL STUDY OF THE STEADY AND UNSTEADY AIRLOADS ON A WING WITH OSCILLATING CONTROL INCLUDING A STREAMLINED GAP

Wolfgang Geissler Feb. 1981 52 p refs
(DFVLR-FB-81-18) Avail: NTIS HC A04/MF A01; DFVLR, Cologne DM 13.50

A wing section with oscillation control was studied in a 3m low speed wind tunnel. In order to simulate a realistic configuration, the gap between wing and control surface was streamlined. A modified analytical surface singularity method, taking into account the exact boundary conditions and Bernoulli equation, was developed. With this method the problem is handled as an inteference problem between two lifting bodies with two Kutta conditions. Local lift distributions obtained from both experiment and theory are compared for a variety of parameters, such as aspect ratio, section incidence, steady flap deflection, oscillation frequency, wake location, and open/closed slot. Outside the gap the correspondence between the exact potential theory and the experimental data is excellent. Deviations within the gap region are attributed to viscous effects.

AN EXPERIMENTAL STUDY OF TOLLMIEN-SCHLICHTING WAVE CANCELLATION Ph.D. Thesis

Robert Weldon Milling 1981 106 p
Avail: Univ. Microfilms Order No. 8123681

A method is proposed which would maintain laminar flow by cancelling boundary layer disturbance waves in the initial stages of growth by interference with artificially created waves of the proper amplitude and phase. An experiment was conducted to determine if the simplest possible disturbance, a Tollmien-Schlichting wave, could be cancelled by interference with an artificially generated disturbance. A flat plate with essentially zero pressure gradient in a low turbulence water channel was used. The disturbance wave and the cancellation wave were introduced artificially by electromagnetically driven wave generators located 59.5 inches and 83.5 inches, respectively, from the leading edge of the flat plate. The nominal flow velocity was

0.5 to 0.6 feet per second. Two dimensional flow was maintained over a region 3 inches to each side of the centerline of the flat plate which was 14 feet long. Cancellation of as high as 90% was shown to be possible, although, generally, absolute amplitudes of the perturbation velocity much below 0.1% of the freestream velocity were seldom obtained. AERODYNAMICS OF AN AIRFOIL WITH A JET ISSUING FROM ITS SURFACE Ph.D. Thesis

Domingo Armando Tavella 1981 94 p

Avail: Univ. Microfilms Order No. 8124165

A simple, two dimensional, incompressible and inviscid model for the problem posed by a two dimensional wing with a jet issuing from its lower surface is considered and a parametric analysis is carried out to observe how the aerodynamic characteristics depend on the different parameters. The mathematical problem constitutes a boundary value problem where the position of part of the boundary is not known a priori. A nonlinear optimization approach is used to solve the problem, and the analysis reveals interesting characteristics that may help to better understand the physics involved in more complex situations in connection with high-lift systems. Dissert. Abstr.

N82-13122 Stanford Univ., Calif.

UNSTEADY AEROELASTIC MODELING AND TRAILING-EDGE FLAP CONTROL OF AN EXPERIMENTAL WING IN A TWO DIMENSIONAL WIND TUNNEL Ph.D. Thesis

Paul Murray Stoltz 1981 232 p

Avail: Univ. Microfilms Order No. 8124159

Theoretical and experimental investigations into unsteady aeroelastic modeling and trailing edge flap control are presented for a wing flap system mounted in a two dimensional wind tunnel. The unsteady pressure distribution over the wing and flap is estimated from linearized potential theory, where the airflow is assumed incompressible and inviscid. An analytical model is developed which includes the wing flap structural states plus one additional state to represent the unsteady aerodynamics. A root focus of the analytical aeroelastic eigenvalues versus dynamic pressure is presented and compared with experimental behavior for dynamic pressures in the range zero to twice the flutter value. A control law is developed to stabilize the wing flap system at a dynamic pressure equal to twice the open loop flutter value. A regulator is developed which incorporates full state feedback and estimation. Theoretically predicted and experimentally measured closed loop aeroelastic eigenvalues are compared for dyamic pressures in the range zero to twice the open loop flutter value. Dissert. Abstr.

GUIDELINES FOR LINE-ORIENTED FLIGHT TRAINING, VOLUME 2

John K. Lauber and H. Clayton Foushee 1981 156 p refs Proceedings of conf. held at NASA Ames Research Center, Calif., 13-15 Jan. 1981

(NASA-CP-2184-Vol-2) Avail: NTIS HC A08/MF A01 CSCL 05I

Current approaches to line-oriented flight training used by six American airlines are described. This recurrent training methodology makes use of a full-crew and full-mission simulation to teach and assess resource management skills, but does not necessarily fulfill requirements for the training and manipulation of all skills. For individual titles, see N82-13124 through N82-13134.

ISSUES RELATED TO LINE-ORIENTED FLIGHT TRAINING

John K. Lauber *In its* Guidelines for Line-oriented Flight Training, Vol. 2 1981 p 14-25 (For primary document see N82-13123 04-03)

Avail: NTIS HC A08/MF A01 CSCL 05I

The use of a training simulator along with carefully structured, detailed, line trip scenarios was envisioned by NASA as a means of providing a controllable, repeatable way to observe line crews in a highly realistic simulation of their working environment and obtain better understanding operationally significant human factors problems and issues. Relevant research done by the agency and the results of full-mission simulation scenarios revealed potential implications for flight training. Aspects to be considered in creating training programs closely related to the actual line environment with a total crew application in real world incident experiences include: (1) operational, environmental, equipment, and crew problems in scenario design; (2) real time line oriented flight training operation; (3) performance assessment and debriefing; (4) instructor qualification and training; and (5) other issues such as ub un initial, transition, and upgrade training: procedures development and evaluation, and equipment evaluation. A.R.H.

UNITED AIRLINES LOFT TRAINING
Dale Cavanagh and Bill Traub *In its* Guidelines for Line-oriented Flight Training, Vol. 2 1981 p 43-55 (For primary document see N82-13123 04-03)
Avail: NTIS HC A08/MF A01 CSCL 05I

Line oriented training is used in a broader, more generic sense that as a specific program under FAR 12.1409 and AC 120-35. A company policy was adopted more thany twenty years ago requiring that all pilot checks and recurrent training be conducted with a full crew occupying the seats they occupy on the line. Permission was obtained to reschedule the hours for recurrent proficiency training to include one and one-half hours of LOFT flight. The number of emergencies and abnormal procedures which could be undertaken were considered and the introduction of an a occasional incapacitation revealed which person is the most difficult to replace on the widebodies. By using the LOFT concept, every training period can be structured like a typical line flight. The use of LOFT in simulator syllabus development and problems that need to be refined are discussed. A.R.H.

TEXAS INTERNATIONAL AIRLINES LOFT PROGRAM
Jack Sommerville *In its* Guidelines for Line-oriented Flight Training, Vol. 2 1981 p 71-78 (For primary document see N82-13123 04-03)
Avail: NTIS HC A08/MF A01 CSCL 05I

A line-oriented flight training program which allows the crew to work as a team to solve all problems, abnormal or emergency, within the crew concept. A line-oriented check ride takes place every six months for the pilot as a proficiency check. There are advantages and disadvantages to this program. One disadvantage is that since it is designed as a check-ride, the scenarios must be structured so that the average pilot will complete the check-ride without complication. This system is different from a proficiency check which can be stopped at a problem area so training to proficiency can take place before proceeding with the check. A.R.H.

N82-13129*# National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.
DELTA AIRLINES LOFT TRAINING
Jay Whitehead *In its* Guidelines for Line-oriented Flight Training, Vol. 2 1981 p 79-91 (For primary document see N82-13123 04-03)
Avail: NTIS HC A08/MF A01 CSCL 05I

A LOFT program was developed as part of the DC-9 training program which serves as a prototype for much of Delta's other aircraft training programs. The LOFT used differs little from the ideology presented in the Advisory Circular. Difficulty and experienced concerns regarding the effectiveness of LOFT as a complete training vehicle are explored. A.R.H.

AMERICAN AIRLINES LOFT EVALUATION PROGRAM
Don Jensen *In its* Guidelines for Line-oriented Flight Training, Vol. 2 1981 p 92-102 (For primary document see N82-13123 04-03)
Avail: NTIS HC A08/MF A01 CSCL 05I

The development of a test program to evaluate recurrent training LOFT and a three-legged scenario used for the evaluation are highlighted. The test guidelines set up and the questionnaires sent to crew member participants are examined. A.R.H.

N82-13131*# National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.
GROUP 1: SCENARIO DESIGN AND DEVELOPMENT ISSUES
Peter Sherwin *In its* Guidelines for Line-oriented Flight Training, Vol. 2 1981 p 113-117 (For primary document see N82-13123 04-03)
Avail: NTIS HC A08/MF A01 CSCL 05I

All LOFT scenarios and flight segments should be designed on the basis of a detailed statement of specific objectives. These objectives must state what kind of situation is to be addressed and why. The origin, routing, and destination of a particular scenario should be dictated by the specific objectives for that scenario or leg. Other factors to be considered are the desired weather, climate, etc. Simulator visual system, as well as other capabilities and limitations must be considered at a very early stage of scenario design. The simulator navigation area must be apropriate and must coincide with current Jeppeson charts. Much of the realism of LOFT is destroyed if the crew is unable to use current manuals and other materials. A.R.H.

N82-13132*# National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.
GROUP 2: REAL TIME LOFT OPERATIONS
Dale Cavanagh *In its* Guidelines for Line-oriented Flight Training, Vol. 2 1981 p 118-126 (For primary document see N82-13123 04-03)
Avail: NTIS HC A08/MF A01 CSCL 05I

All LOFT scenarios should be constructed so as to provide the highest degree of realism that is economically, technically, and operationally feasible. The more realistic the situation, the faster the crew will adjust their thinking and provide reactions which would be typical of a line-flight orientation. The goal is to produce crew performance which would be typical of a crew on an actual line flight, given the same set of circumstances that were developed during the scenario. The briefing which is provided to the crew before entering the simulator for LOFT, the trip papers, the communications throughout the flight, the role played by the instructor, and so on, are important factors, crucial to the establishment and maintenance of a high degree of realism. Crews should have all manuals and other required equipment for a normal line-flight. A.R.H.

N82-13133*# National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.
GROUP 3: PERFORMANCE EVALUATION AND ASSESSMENT
Al Frink *In its* Guidelines for Line-oriented Flight Training, Vol. 2 1981 p 122-126 (For primary document see N82-13123 04-03)
Avail: NTIS HC A08/MF A01 CSCL 05I

Line-oriented flight training provides a unique learning experience and an opportunity to look at aspects of performance other types of training did not provide. Areas such as crew coordination, resource management, leadership, and so forth, can be readily evaluated in such a format. While individual performance is of the utmost importance, crew performance deserves equal emphasis, therefore, these areas should be carefully observed by the instructors as an rea for discussion in the same way that individual performane is observed. To be effective, it must be accepted by the crew members, and administered by the instructors as pure training-learning through experience. To keep open minds, to benefit most from the experience, both in the doing and in the follow-on discussion, it is essential that it be entered into with a feeling of freedom, openness, and enthusiasm. Reserve or defensiveness because of concern for failure must be inhibit participation. A.R.H.

N82-13134*# National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.

GROUP 4: INSTRUCTOR TRAINING AND QUALIFICATIONS

Ron Sessa *In its* Guidelines for Line-oriented Flight Training, Vol. 2 1981 p 127-135 (For primary document see N82-13123 04-03)
Avail: NTIS HC A08/MF A01 CSCL 05I

Each professional instructor or check airman used in LOFT training course should complete an FAA approved training course in the appropriate aircraft type. Instructors used in such courses need not be type-rated. If an instructor or check airman who is presently not line-qualified is used as a LOFT instructor, he or she should remain current in line-operational procedures by observing operating procedures from the jump seat on three typical line segments pr 90 days on the appropriate aircraft type. ('Line qualification' means completion as a flight crew member of at least three typical line segments per 90 days on the appropriate aircraft type.) The training should include the requirement of four hours of LOFT training, in lieu of actual aircraft training or line operating experience. A.R.H.

TECHNIQUES FOR INTERFACING MULTIPLEX SYSTEMS Final Report, 10 Sep. 1979 - 10 May 1980

James P. Gross Feb. 1981 138 p
(Contract F33615-79-C-1878; AF Proj. 2003)
(AD-A101457; AFWAL-TR-80-1223) Avail: NTIS HC A07/MF A01 CSCL 17/2

Data describing the characteristics of a number of aircraft multiplex systems were collected and compiled. Although Air Force aircraft received priority, were consideration was also given to other military and commercial aircraft. The F-16, B-52 OAS, YAH-64, F-18, F-15 and ARINC 575 systems were included. MIL-STD-1553B was used as a baseline for comparison. The compiled data was analyzed to determine points of incompatibility between these systems and a feasibility study was performed to assess possible techniques to be used in achieving bus compatibility. A programmable interface module design philosophy is recommended which utilizes a distributed three-microprocessor arrangement to achieve the desired interface compatibility. The three-processor conept allows three independent software-controlled events to occur simultaneously, thus providing an extremely high degree of flexibility both for existing systems and for future growth. SYSTEM IDENTIFICATION HELICOPTER PARAMETERS. DETERMINATION FROM FLIGHT TESTS, PHASE 2 [SYSTEMIDENTIFIZIERUNG DREHFLUEGLER KENNWERT-ERMITTLUNG AUS FLUGMESSUNGEN (PHASE 2)]

M. Kloster and S. Attlfellner Bonn Bundesministerium der Verteidigung 1380 92 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium der Verteidigung
(BMVg-FBWT-80-12) Avail: NTIS HC A05/MF A01; DOKZENTw, Bonn DM 30

A parameter identification program for a hingeless rotor helicopter is considered. Flight conditions were selected with increasing instability, i.e., hover and level flight at maximum speed; with maximum weight and with a rearward center of gravity. A strap down system was chosen to provide the attitude feedback control necessary for proper identification. The control input signals were optimized for the unstabilized helicopter. Calculations in the time and frequency domains show that special distributions in the power spectrum of the input signals are needed for optimizing the closed loop system. The identified derivatives and the smoothened time histories from flight tests are compared with the identification results of linear and nonlinear simulations and of the quasistatic theory. MANEUVER LOAD CONTROL FOR THE REDUCTION OF DESIGN LOADS AND IMPROVEMENT OF THE MANEUVERABILITY OF MODERN FIGHTER AIRCRAFT

Horst Balke Bonn Bundesministerium der Verteidigung 1981 283 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium der Verteidigung
(BMVg-FBWT-81-2) Avail: NTIS HC A13/MF A01; DOKZENTBw, Bonn DM 50

Active control technology is applied and the feasibility of design load reduction is analyzed. The influence of direct force control on aircraft component loads and on aircraft maneuverability is seen. The deflection of secondary control surfaces in proportion with the commanded control surface was investigated in an open loop control system. Load reduction efficiency diagrams and tables are presented. A comparison of two different aircraft shows that with an open loop control system a considerable reduction in design load is possible. The loads acting on several aircraft components for different open loop control systems are compared. Several closed loop control systems with aircraft response feedback parameters were also investigated. The results are again presented as diagrams, and tables. Only in some cases does closed loop control achieve better results than open loop control. The best design load reduction is achieved with a combined open and closed loop control system. The investigation results are comprehensively evaluated and the parameters relevant for design load reduction are summarized. Author (ESA)

RAVEN AIRCRAFT FILTER-ABSORBER
Jerzy Chojnacki 26 Nov. 1980 5 p Transl. into ENGLISH from Skrzydlata Polska (Poland), Vol. 1, no. 51-52, 1979 p 7
(AD-A098962; FTD-ID(RS)T-2017-80) HC A02/MF A01 CSCL 06/11

A filter-absorber in the shape of a rectangular box and weighing 9.5 kg is mounted outside the cockpit of an agricultural aircraft. Toxic compounds given off during crop spraying are trapped by internal filters. The first, or forward filter has Anilana fibers. The second, or actual purification filter, is made from fiberglass which absorbs the finest airborne contaminants. The pesticide filter-absorber device is guaranteed for 100 hours of operation and was designed for use in Africa. A.R.H.

A review of factors influencing installation of aircraft flight test instrumentation is presented. Requirements, including such factors as environment, reliability, maintainability, and system safety are discussed. The assessment of the mission profile is followed by an overview of electrical and mechanical installation factors with emphasis on shock/vibraion isolation systems and standardization of the electric wiring installation, two factors often overlooked by instrumentation engineers. A discussion of installation hardware reviews the performance capabilities of wiring, connectors, fuses and circuit breakers, and a guide to proper selections is provided. The discussion of the installation is primarily concerned with the electrical wire routing, shield terminations and grounding. Also inclued are some examples of installation mistakes that could affect system accuracy. System verification procedures and special considerations such as sneak circuits, pyrotechnics, aircraft antenna patterns, and lightning strikes are discussed. M.D.K.

NUMERICAL ANALYSIS OF THE SCRAMJET-INLET FLOW FIELD BY USING TWO-DIMENSIONAL NAVIER-STOKES EQUATIONS
Ajay Kumar Dec. 1981 30 p refs
(NASA-TP-1940; L-14776) Avail: NTIS HC A03/MF A01 CSCL 21E

A computer code was developed to solve the full two dimensional Navier-Stokes equations in a supersonic combustion ramjet (scramjet) inlet. In order to be able to consider a general inlet geometry with embedded bodies, a numerical coordinate transformation is used which generates a set of boundary-fitted curvilinear coordinates. The explicit finite difference algorithm of MacCormack is used to solve the governing equations. An algebraic, two-layer eddy-viscosity model is used for the turbulent flow. The code can analyze both inviscid and viscous flows with no strut, one strut, or multiple struts in the flow field. The application of the two dimensional analysis in the preliminary parametric design studies of a scramjet inlet is discussed. Detailed results are presented for one model problem and for several actual scramjet-inlet configurations. R.J.F.

EFFECT OF FUEL-AIR-RATIO NONUNIFORMITY ON EMISSIONS OF NITROGEN OXIDES
Valerie J. Lyons Nov. 1981 14 p refs
(NASA-TP-1798; E-648) Avail: NTIS HC A02/MF A01 CSCL 21E

The inlet fuel-air ratio nonuniformity is studied to deterine how nitrogen oxide (NOx) emissions are affected. An increase in NOx emissions with increased fuel-air ratio nonuniformity for average equivalence ratios less than 0.7 and a decrease in NOx emissions for average equivalence ratios near stoichiometric is predicted. The degree of uniformityy of-fuel-air ratio profiles that is necessary to achieve NOx emissions goals for actual engines that use lean, premixed, prevaporized combustion systems is determined. S.L.

A REAL TIME PEGASUS PROPULSION SYSTEM MODEL FOR VSTOL PILOTED SIMULATION EVALUATION
James R. Mihaloew, Stephen P. Roth (Pratt and Whitney Aircraft Group, West Palm Beach, Fla.), and Robert Creekmore (Pratt and Whitney Aircraft Group, West Palm Beach, Fla.) 1981 18 p refs Presented at VSTOL Conf., Palo Alto, Calif., 7-9 Dec. 1981; sponsored by AIAA and NASA. Ames Research Center
(NASA-TM-82770; E-1004; AIAA-81-2663) Avail: NTIS HC A02/MF A01 CSCL 21E

A real time propulsion system modeling technique suitable for use in man-in-the-loop simulator studies was developed This technique provides the system accuracy, stability, and transient response required for integrated aircraft and propulsion control system studies. A Pegasus-Harrier propulsion system was selected as a baseline for developing mathematical modeling and simulation techniques for VSTOL. Initially, static and dynamic propulsion system characteristics were modeled in detail to form a nonlinear aerothermodynamic digital computer simulation of a Pegasus engine. From this high fidelity simulation, a real time propulsion model was formulated by applying a piece-wise linear state variable methodology. A hydromechanical and water injection control system was also simulated. The real time dynamic model includes the detail and flexibility required for the evaluation of critical control parameters and propulsion component limits over a limited flight envelope. The model was programmed for interfacing with a Harrier aircraft simulation. Typical propulsion system simulation results are presented. M.D.K.

SENSOR FAILURE DETECTION SYSTEM Final Report
E. C. Beattie, R. F. LaPrad, M. E. McGlone, S. M. Rock, and M. M. Akhter Aug. 1981 172 p refs Prepared in cooperation with Systems Control, Inc., Palo Alto, Calif.
(Contract NAS3-22481)
(NASA-CR-165515; PWA-5736-17) Avail: NTIS HC A08/MF A01 CSCL 21E

Advanced concepts for detecting, isolating, and accommodating sensor failures were studied to determine their applicability to the gas turbine control problem. Five concepts were formulated based upon such techniques as Kalman filters and a screening process led to the selection of one advanced concept for further evaluation. The selected advanced concept uses a Kalman filter to generate residuals, a weighted sum square residuals technique to detect soft failures, likelihood ratio testing of a bank of Kalman filters for isolation, and reconfiguring of the normal mode Kalman filter by eliminating the failed input to accommodate the failure. The advanced concept was compared to a baseline parameter synthesis technique. The advanced concept was shown to be a viable concept for detecting, isolating, and accommodating sensor failures for the gas turbine applications. M.G.

NASA RESEARCH IN AIRCRAFT PROPULSION
Milton A. Beheim 1982 17 p Proposed for presentation at the 27th Ann. Intern. Gas Turbine Conf., London, 18-22 Apr. 1982; sponsored by ASME
(NASA-TM-82771; E-1096) Avail: NTIS HC A02/MF A01 CSCL 21E

A broad overview of the scope of research presently being supported by NASA in aircraft propulsion is presented with emphasis on Lewis Research Center activities related to civil air transports, CTOL and V/STOL systems. Aircraft systems work is performed to identify the requirements for the propulsion system that enhance the mission capabilities of the aircraft. This important source of innovation and creativity drives the direction of propulsion research. In a companion effort, component research of a generic nature is performed to provide a better basis for design and provides an evolutionary process for technological growth that increases the capabilities of all types of aircraft. Both are important. A.R.H.

DESIGN FOR ACTIVE AND PASSIVE FLUTTER SUPPRESSION AND GUST ALLEVIATION Ph.D. Thesis
Mordechay Karpel Washington NASA Nov. 1981 117 p refs
(Grant NGL-05-020-243)
(NASA-CR-3482) Avail: NTIS HC A06/MF A01 CSCL 01C

Analytical design techniques for active and passive control of aeroelastic systems are based on a rational approximation of the unsteady aerodynamic loads in the entire Laplace domain, which yields matrix equations of motion with constant coefficients. Some existing schemes are reviewed, the matrix Pade approximant is modified, and a technique which yields a minimal number of augmented states for a desired accuracy is presented. The state-space aeroelastic model is used to design an active control system for simultaneous flutter suppression and gust alleviation. The design target is for a continuous controller which transfers some measurements taken on the vehicle to a control command applied to a control surface. Structural modifications are formulated in a way which enables the treatment of passive flutter suppression system with the same procedures by which active control systems are designed. A.R.H.

LIMITED EVALUATION OF AN F-14A AIRPLANE UTILIZING AN AILERON-RUDDER INTERCONNECT CONTROL SYSTEM IN THE LANDING CONFIGURATION

Wendell W. Kelley and Einar K. Enevoldson (NASA. Dryden Flight Research Center) Dec. 1981 39 p refs
(NASA-TM-81972; L-14756) Avail: NTIS HC A03/MF A01 CSCL 01C

A flight test was conducted for preliminary evaluation of an aileron-rudder interconnect (ARI) control system for the F-14A airplane in the landing configuration. Two ARI configurations were tested in addition to the standard F-14 flight control system. Results of the flight test showed marked improvement in handling qualities when the ARI systems were used. Sideslip due to adverse yaw was considerably reduced, and airplane turn rate was more responsive to pilot lateral control inputs. Pilot comments substantiated the flight data and indicated that the ARI systems were superior to the standard control system in terms of pilot capability to make lateral offset corrections and heading changes on final approach. ANALYSIS OF A LONGITUDINAL PILOT-INDUCED OSCILLATION EXPERIENCED ON THE APPROACH AND LANDING TEST OF THE SPACE SHUTTLE

John W. Smith Dec. 1981 45 p refs
(NASA-TM-81366) Avail: NTIS HC A03/MF A01 CSCL 05H

During the final free flight (FF-5) of the shuttle's approach and landing tests, the vehicle experienced pilot-induced oscillations near touchdown. The light test data showed that pilot inputs to the hand controller reached peak-to-peak amplitudes of 20 deg at a frequency between 3 and 3.5 radians per second. The controller inputs were sufficient to exceed the priority rate limit set in the pitch axis. A nonlinear analytical study was conducted to investigate the combined effects of pilot input, rate limiting, and time delays. The frequency response of the total system is presented parametrically as a function of the three variables. In general, with no dead time, for controller inputs of 5 deg or less, the total system behaves in a linear fashion. For 10 deg of controller input, independent of the delay time, the elevon loop will be rate saturated above a frequency of 4 radians per second. Author

ON A DUSTY-GAS SHOCK TUBE

H. Miura (Osaka Prefecture, Japan) and I. I. Glass May 1981 80 p refs Sponsored in part by Natural Sciences and Engineering Research Council of Canada, U.S. Army, and Defence Research Establishment, Suffield
(Grant AF-AFOSR-3303-77)
(UTIAS-250; CN-ISSN-0082-5255) Avail: NTIS HC A05/MF A01

Analytical and numerical methods were used to investigate the flow induced by a shock wave in a shock-tube channel containing air laden with suspended small solid particles. Exact results are given for the frozen and equilibrium shock wave properties as a function of diaphragm-pressure ratio and shock-wave Mach numbers. The driver contained air at high pressure. A modified random-choice method together with an operator-splitting technique show the decay of a discontinuous frozen shock wave, a contact discontinuity, formation of a stationary shock structure, and an effective contact front of finite thickness. The effects of particle diameter, particle-number density, and diaphragm-pressure ratio on the transitional behavior of the flow are investigated in detail. The alteration of flow properties due to the presence of particles is discussed in detail and compared with classical shock-tube flows. Author

Thermal fining, thermal migration of bubbles under reduced gravity conditions, and data to verify current theoretical models of bubble location and temperatures as a function of time are discussed. A sample, sodium borate glass, was tested during 5 to 6 minutes of zero gravity during rocket flight. The test cell contained a heater strip; thermocouples were in the sample. At present quantitative data are insufficient to confirm results of theoretical calculations. M.D.K.

REGULARIZED INTEGRATION OF GRAVITY-PERTURBED TRAJECTORIES: A NUMERICAL EFFICIENCY STUDY

L. Glenn Kraige, J. L. Junkins, and L. D. Ziems Nov. 1980 221 p refs Backup document for AIAA synoptic scheduled for publication in Journal of Spacecraft and Rockets on Jan./Feb. 1982

Avail: NTIS HC A10/MF A01

It was demonstrated that regularizing transformations can form the basis of highly efficient trajectory approximations. Eight algorithms for predicting the motion of a particle in a perturbed gravity field were brought to final completion for comparison with the Naval Surface Weapons Center Vacuum program. Several methods were found to be more efficient than the Vacuum Encke solution for the cases tested, particularly the Eulr parameter asymptotic expansion, the KS Cowell, the KS Encke, and the Rectangular Encke methods. All but the latter can be characterized as regularized methods. Several of the methods would become even more efficient (relative to Cowell integration schemes) for spacecraft in higher and/or less eccentric trajectories or orbits than the trajectories tested. Three algorithms for the solution of the Lambert problem were developed. Over the twelve cases studies, a straightforward differential correction scheme coupled with the Rectangular Encke motion predictor proved to be more efficient than a more analytical KS Variation of Parameters Approach. SEASAT EQUATOR CROSSING PROGRAM

B. G. Young and D. L. Desaulniers Jun. 1980 31 p refs

(AD-A099442; DREO-TN-80-19) Avail: NTIS HC A03/MF A01 CSCL 09/2

A programmable pocket calculator is used to extrapolate the Seasat orbit from the equator crossing to the position at which the synthetic aperture radar images a given target. The coordinates of the satellite at image time, the Azimuth direction of the image at the target, and the time elapsed between equator crossing and imaging are predicted. Predictions are compared with measured Seasat data from the definitive attitude-orbit files. Author

EFFECTS OF THE SATELLITE POWER SYSTEM ON LOW EARTH ORBIT AND GEOSYNCHRONOUS SATELLITES

W. B. Grant, E. L. Morrison, and J. R. Juroshek Jun. 1981 86 p refs

(Contracts DE-AI06-79RL-10077; DE-AI01-80ER-10160)

(PB81-232019; NTIA/Rept-81/75) Avail: NTIS HC A05/MF A01 CSCL 22A

The large amount of power contained in the main beam and principal sidelobes of the proposed Solar Power System (SPS), now under study by DOE and NASA, potentially presents an EMC problem for other satellite systems. This report examines selected geosynchronous orbit (GEO) satellites in adjacent slots to an SPS, GEO satellites on a chord passing an Earth horizon, and low-earth-orbit (LEO) satellites which may pass throught the SPS power beam. Potential functional and operational impacts to on-board systems are analyzed. Mitigation techniques for SPS effects are examined, and recommendations summarized to allow satellites to operate satisfactorily in an SPS environment. GRA

CONTROL DESIGN FOR PARAMETER SENSITIVITY REDUCTION IN LINEAR REGULATORS: APPLICATION TO LARGE FLEXIBLE SPACE STRUCTURES Ph.D. Thesis

RamaKrishna Yedavalli 1981 236 p

Avail: Univ. Microfilms Order No. 8123729

The problem of control design for linear systems having parameter uncertainty is addressed from two viewpoint: viewpoints to minimize or reduce the trajectory and/or performance cost dispersion from the nominal values in the presence of small variations in the system parameters, and to maintain some optimal or satisfactory level of performance in the presence of small variations in the system parameters subject to model/controller truncation. It is shown that the minimization of a modified performance index that includes a quadratic term of trajectory sensitivity (state, output or control) subject to the augmented sensitivity system dynamics causes reduction not only in trajectory sensitivity but also in cost sensitivity. The control of large flexible space structures where there is large uncertainty associated with the modal data and constraints on the controller order, model reduction is required before linear multivariable theory can be applied to design controllers. The preliminary step taken in this direction is to use the concepts of open loop 'modal cost analysis' to derive explicit analytical formulae for 'modal costs' and 'parameter costs' for specific performance objectives. Dissert. Abstr.

TECHNICAL BASIS FOR EFFICIENT MANAGEMENT OF GEOSTATIONARY SATELLITE ORBIT/SPECTRUM Ph.D. Thesis

Mohammad K. Samarkandy 1981 311 p

Avail: Univ. Microfilms Order No. 8124146

The technical factors for efficient and effective management of the orbit and radio frequency spectrum is established. Concepts of available isolation and required isolation between interfering satellites are introduced to solve inhomogeneous orbit congestion problems that arise between broadcasting and/or fixed satellite systems using different Earth station sizes and transmitting different modulating signals. Methods for reducing this interference are described that employ frequency coordination, polarization isolation, satellite beams separation, and modulation selection. Dissert. Abstr.

TRANSITIONAL BALLISTICS OF HYPERVELOCITY PROJECTILES

Joachim K. Biele Bonn Bundesministerium der Verteidigung 1980 57 p refs Partly in GERMAN and ENGLISH Sponsored by Bundesministerium der Verteidigung

(BMVg-FBWT-80-1) Avail: NTIS HC A04/MF A01; DOKZENTw, Bonn DM 30

The state of the art of transitional ballistics of hypervelocity fin-stabilized projectiles is described, particularly sabot launching from smoothbore guns. The influence of gun-tube vibration and aerodynamic jump on near-muzzle flight direction errors and dispersion is established whereas the gas dynamical effects are shown to be negligible. Detection techniques for gun-tube vibration are discussed and it is shown that muzzle contact and sabot separation induced trajectory perturbations can be observed by means of an electromechanical method, using (nontouching) inductive gages as well as strain gages. Results describing the firing of an 105 mm smoothbore tank gun are presented and analyzed for muzzle influence on free flight behavior.

CONCEPT AND FEASIBILITY STUDY (PHASE A) FOR THE X-RAY SATELLITE ROBISAT. EXECUTIVE SUMMARY Final Report

Gerhard Barthel, Wolfgang Brunner, Jochen Doenecke, Edelbert Eichhorn, Heinrich Hufnagel, Kent oKelly, Gert Leibold, Werner Nagl, Horst Richter, Ernst Sach et al Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 72 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie

(BMFT-FB-W-80-027; ISSN-0170-1339) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 15,10

The feasibility of launching a reusable satellite from a space shuttle which meets high performance characteristics connected with a one-year sky mapping mission of soft X-ray sources in the spectral range between 0.1 and 2.0 keV is studied. The core instrument of the satellite is an 80 cm Wolter telescope. Possible concept alternatives for the telescope, satellite design, orbit parameters, and telemetry are discussed. An optimized concept is presented and its integration and test program are indicated. The cost analysis indicates that this satellite can be built within the limits set by the low program cost requirements.

TWO-CHANNEL TELEMETER FOR USE IN A 3-INCH SPIN AIR GUN

Floyd Allen Jun. 1981 22 p

(AD-A102566; HDL-TR-1961) Avail: NTIS HC A02/MF A01 CSCL 09/6

A special two-channel telemeter-projectile system designed and built for use in a 3-in. spin air gun is described. The system allows batteries to be tested at a far lower cost than field testing. The telemeter projectile is unusually gun rugged an reusable in a simulated artillery environment. Test-battery current and voltage is continuously monitored by subcarrier oscillators. The fuze simulator contains logic components for controlling the battery land program, rather than using steady-state loads for the full flight. This telemeter system has potential applications in remote voltage monitoring over long periods of time.

SHAPE DETERMINATION AND CONTROL FOR LARGE SPACE STRUCTURES
Connie J. Weeks 1 Oct. 1981 175 p refs
(Contract NAS7-100)
(JPL-Pub-81-71) Avail: NTIS HC A08/MF A01 CSCL 22B

An integral operator approach is used to derive solutions to static shape determination and control problems associated with large space structures. Problem assumptions include a linear self-adjoint system model, observations and control forces at discrete points, and performance criteria for the comparison of estimates or control forms. Results are illustrated by simulations in the one dimensional case with a flexible beam model, and in the multidimensional case with a finite model of a large space antenna. Modal expansions for terms in the solution algorithms are presented, using modes from the static or associated dynamic mode. These expansions provide approximated solutions in the event that a used form analytical solution to the system boundary value problem is not available. Author

CONDUCTION AND CHARGE STORAGE IN ELECTRON IRRADIATED SPACECRAFT INSULATORS Final Technical Report, Sep. 1977 - Sep. 1980
J. Wilkenfeld, C. Mallon, and J. Horne Griffiss AFB, New York RADC Jul. 1981 121 p refs
(Contract F19628-77-C-0245; AF Proj. 4600)
(AD-A104796; IRT-8172-008; RADC-TR-81-198) Avail: NTIS HC A06/MF A01 CSCL 22/2

Charge, storage and conduction processes were studies in four spacecraft insulators, FEP Teflon, Kapton, Mylar and fused quartz exposed to monoenergetic electron beams with energies of 5-27 keV as a function of particle flux, sample thickness, applied external bias and temperature. The experimental data was used to determine some of the parameters which control the deposition and transport of keV electrons in representative spacecraft insulators found on the surface of communication and other satellites placed in geostationary orbits. Properties determined include location of the charge deposition centroid, dark, radiation, delayed and surface conductivities. These parameters were then used in the phenomenological transport model to interpret the observed charge leakage behavior under various exposure conditions. In the model, the sample is divided into two regions. In the irradiated region, radiation-induced conductivity is the predominant conduction mechanism. In the nonirradiated region, space-charge limited currents predominate. Author (GRA)

ON THE MODELING AND CONTROL OF FLEXIBLE SPACE STRUCTURES Ph.D. Thesis
Bong Wie 1981 216 p
Avail: Univ. Microfilms Order No. 8124171

The development of generic models of flexible space structures for control analysis and synthesis is discussed. Transfer functions with exact poles and zeros are derived for some simple generic models such as bars, beams, membranes, toroids, a triangular truss, and a triangular frame. In the first two models (bars and beams), transfer functions for the separated actuator and sensor pairs are also discussed. A comparison is made between the two lumped parameter transfer functions obtained by (1) truncating the exact partial fraction expansion, and (2) truncating the exact infinite product expansion of an infinite dimensional transfer function. The significance of near pole zero cancellations and inherent structural damping in designing control logic for infinite dimensional systems is shown. Attitude control of flexible space structures with an infinite number of vibration modes is investigated by using the exact infinite - dimensional transfer functions. Dissert. Abstr.

JASPIC-DIP: THE DIGITAL IMPEDANCE PROBE IN THE JASPIC PROJECT Final Report
Eugen Neske and Josef Molnar Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 48 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-80-034; ISSN-0170-1339) Avail: NTIS HC A03/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 10,10

A digital impedance probe (DIP) was developed to be used in the Joint American Soviet Particle Inter-Calibration (JASPIC) program. It is capable on the one hand of providing fast and reliable estimates of the electron density height profiles in the nocturnal ionosphere, and on the other hand, of delivering density data with high accuracy during the subsequent analysis. Two techniques were developed: (1) fast scanning automatic resonance detection, and (2) slow scanning frequency-magnitude transmission. Apparatus and electronics are described. Results of rocket-borne experiments indicate DIP to be superior to three other diagnostical techniques, or to be necessary for their calibration. Author (ESA)

CONSTITUTION OF SILICATE ANIONS IN TETRAETHYLAMMONIUM SILICATES AND THEIR AQUEOUS SOLUTIONS
D. Hoebbel 1981 26 p refs Transl. into ENGLISH from Z. Anorg. Allg. Chem. (East Germany), no. 465, 1980 p 15-33
(NRC/CNR-TT-2004) Avail: NTIS HC A03/MF A01

Studies aided by paper chromatography, Si-29 NMR, and trimethylsilylation methods show that in concentrated tetraethyl ammonium silicate solutions with molar TEA:Si ratios of 2.8 to 1, for the most part double three-ring silicate anions are present, along with small concentrations of mono-, di-, tri-, tetra-, cyclotri-, cyclotetra-, double four-ring, and other polycyclic silicate anions. At low temperatures a double three-ring silicate with the formula [N(C2H5)4]6 [Si6O15].57H2O crystallizes out. Concentrated solutions with TEA:Si = 0.8 to 0.6 contain predominantly double three-, double four-, and probably also double six-ring silicate anions. From these solutions the TEA-double four-ring silicate always crystallizes out. The possible reasons for the preferential formation of double-ring silicate anions in TEA-silicate solutions and their crystallization are discussed. Author

Prepared for JPL
(Contract JPL-955531)
(NASA-CR-165016; JPL-9950-606; DOE/JPL-955531-81/1)
Avail: NTIS HC A03/MF A01 CSCL 07C

Successful grafting of 2(2-hydroxy-5-vinylphenyl)2H-benzotriazole onto saturated aliphatic C-H groups of polymers has been accomplished. When the grafting reaction was carried out in chlorobenzene at 150 C - 160 C with di-tertiarybutylperoxide as the grafting initiator, grafts as high as 20 percent - 30 percent at a grafting efficiency of 50 percent and 80 percent have readily been obtained. The grafting reaction was carried out in tubes sealed under high vacuum since trace amounts of oxygen cause complete inhibition of the grafting reaction by the phenolic monomer. On a variety of different polymers including atactic polypropylene, ethylene/vinyl acetate copolymer, poly(methyl methacrylate), poly(butyl acrylate), and polycarbonate were used. A.R.H.

N82-13172 Georgia Inst. of Tech., Atlanta.
EFFECTS OF HYGROTHERMAL CONDITIONING ON THE DYNAMIC BEHAVIOR OF RESIN MATRIX COMPOSITES Ph.D. Thesis
Ronald Patrick Briley 1981 121 p
Avail: Univ. Microfilms Order No. 8124282

The effects of hostile, hygrothermal environments on the dynamic behavior of graphite/epoxy composites were investigated. Flexural vibration tests were performed on Narmco 5208/T300 beam specimens of four distinct layups. Dynamic behavior in the dry, room temperature state is contrasted with five other environmental states, including moisture saturation and temperatures up to 93 C. The properties determined are fundamental natural frequency and damping. The measured natural frequency is directly related to an effective dynamic modulus in flexure. These properties reflect the consequences of plasticization of the epoxy matrix material hydrothermal environments. The experimental results, after correction for parasitic damping contributions, are consistent with behavioral trends. The glass transition temperature for the material in its moisture saturated state appears to be between 82 C and 93 C which is somewhat lower than expected. Dissert. Abstr.

N82-13173 Virginia Polytechnic Inst. and State Univ., Blacksburg.
CREEP AND CREEP RUPTURE OF LAMINATED GRAPHITE/EPOXY COMPOSITES Ph.D. Thesis
David A. Dillard 1981 245 p
Avail: Univ. Microfilms Order No. 8121498

Graphite epoxy composite material exhibit creep and delayed failures. An incremental numerical procedure based on lamination theory was developed to predict creep and creep rupture of general laminates. Existing unidirectional creep compliance and delayed failure data were used to develop analytical models for lamina response. The compliance model is based on a procedure proposed by Findley which incorporates the power law for creep into a nonlinear constitutive relationship. The matrix octahedral shear stress is assumed to control the stress interaction effect. A modified superposition principle is used to account for the varying stress level effect on the creep strain. The lamina failure model is based on a modification of the Tsai-Hill theory which includes the time dependent creep rupture strength. A linear cumulative damage law is used to monitor the remaining lifetime in each ply. Creep compliance and delayed failure data are presented for several general laminates along with the numerical predictions. Dissert. Abstr.

GAS TURBINE COMBUSTOR SOOT AND RADIATION Ph.D. Thesis
Jim Alan Clark 1981 197 p
Avail: Univ. Microfilms Order No. 8123652

Gas turbine combustor soot and radiation were studied using two distinct methods which depend on experimental measurements of soot concentration and flame radiation in a model gas turbine combustor. A strong empirical relationship between the primary zone radiation intensity and two fuel properties-percent hydrogen and percent polycyclic aromaticity was found. The effective hydrogen content was found to be the tendency of a fuel. The second study used temperature and soot concentration mappings of the combustor flowfield to make predictions of radiation intensity and emissivity of a DF-2 flame. A comparison of the predicted and measured intensities and emissivities showed agree poorly, and the lack of agreement was attributed to errors in soot mass concentration measurements. The radiative transfer equation was used to deduce the approximate average soot concentration, and from this deduction the magnitude of soot error was estimated. Dissert. Abstr.

N82-13175 Northwestern Univ., Evanston, Ill.
SURFACE ENHANCED RAMAN SPECTROSCOPY FOR INTERFACIAL CHARACTERIZATION Ph.D. Thesis
Steven George Schultz 1981 158 p
Avail: Univ. Microfilms Order No. 8125008

Surface enhanced Raman spectroscopy (SERS) is developed as a useful tool for the characterization of the interface between a solid metal (silver) electrode and the bulk (liquid) electrolyte. Some metal surfaces, especially silver, enhance the Raman scattering intensity by a factor of at least one million above normal Raman intensities. Exceptionally intense Raman signals are obtained from electrode surfaces if the adsorbate is also enhanced with resonance Raman (RR) processes. The total scattering cross section is increased by the product of the SERS and RRS enhancements. The power of this combination shows excellent quality Raman spectra from water soluble porphyrins adsorbed to the silver electrode even at porphyrin concentrations in the nanomolar range. The SERS intensity dependence with potential is sensitive to minor substituents on the porphyrin ring. Dissert. Abstr.

N82-13176 Northwestern Univ., Evanston, Ill.
RESONANCE RAMAN SPECTROSCOPIC INVESTIGATIONS OF THE ACTIVE SITE STRUCTURES OF HEMOGLOBIN AND

HEMERYTHRIN Ph.D. Thesis
Lori London Duff Weddell 1981 225 p
Avail: Univ. Microfilms Order No. 8125037

Resonance Raman spectroscopy is used to probe the active sites of hemoglobin and hemerythrin. For oxyhemoglobin oxygenated with O16O18, the resonance Raman spectrum in the FeO_2 stretching region demonstrates end on O_2 geometry, like the Pauling structure, and rules out the symmetric side on geometry of the Griffith structure. Several methemerythrins are studied including sulfido methemerythrin and semimetazido hemerythrin. Many methemerythrins have a Raman band at approximately 50 cm which is assigned to an iron oxygen stretch. The identity of the oxygen ligand and exchange behavior with H2O18 are studied. Oxygen isotope exchange with solvent water is observed only when oxyhemerythrin in H2O18 is converted to methemerythrin by addition of azide, cyanate or cyanide ions. Dissert. Abstr.

N82-13177 Seton Hall Univ., South Orange, N. J.
SURFACE CHARACTERIZATION OF DISPERSED SUPPORTED METAL CATALYSTS USING A 'TIME LAPSE' DYNAMIC PULSE TECHNIQUE Ph.D. Thesis
Robert William Warner 1981 127 p
Avail: Univ. Microfilms Order No. 8122399

A dynamic pulse vapor phase 'time lapse' procedure was used to investigate the initial turnovers occurring in the hydrogenation of a double bond over supported platinum and palladium catalysts. With the platinum catalysts, the product compositions obtained in olefin hydrogenation reactions were used to characterize the relative amounts of the various types of reactive sites present on the catalyst surface, leading to the development of a surface site model for these supported catalysts. Initial treatment of the palladium catalyst with an olefin resulted in a change in its reaction characteristics. Presaturation of either catalyst with hydrogen results in the storage of hydrogen. Surface site modifiers such as alcohols and benzene were used to study the competition between an olefin substrate and hydrogen for adsorption on each reactive site type. Dissert. Abstr.

N82-13178 Tennessee Univ., Knoxville.
THE CHEMISTRY OF SALINE WATER CHLORINATION Ph.D. Thesis
Werner Robert Haag 1981 161 p
Avail: Univ. Microfilms Order No. 8123155

Natural water chlorination chemistry is reviewed with particular reference to saline waters. Some experimental work led to the isolation of the first known pure solution of a N-bromo N chloroamine, namely, methyl bromochloramine. Physical and chemical properties of these compounds are characterized, in both concentrated CCl_4 solution and dilute aqueous solution. Bromochloramines can readily form under conditions of power plant cooling water chlorination, if saline water is used. Chlorine losses at very high doses in seawater are simply the result of chlorate and bromate formation which is negligible at normal doses. The important chlorine produced oxidants, along with the relevant chemical reactions, are chosen as a basis for a kinetic model of saline water chlorination chemistry. Dissert. Abstr.

N82-13179 Duke Univ., Durham, N. C.
APPLICATION OF ELECTROCHEMISTRY TO BIOCHEMICAL PROBLEMS Ph.D. Thesis
Billy Gene Bennett 1981 91 p
Avail: Univ. Microfilms Order No. 8124789

An immunoassay technique using differential pulse anodic stripping voltammetry (DPASV) detection was demonstrated. The voltammetric immunoassay (VIA) technique is based on the competition of antigen with electrochemically labelled antigen for binding sites on a selective antibody. Estriol, used as a model system was labelled with the electroactive group, cadmium acetate. Addition of estriol antibody diminished the peak current due to binding of the electrochemically labelled estriol with the antibody. Subsequent addition of unlabelled estriol increased the peak current due to competitive displacement of the labelled estriol from the antibody. This competitive equilibrium was the basis of the technique that could be used as a sensitive immunoassay for estriol. Electrochemical labelling of a species can provide for quantitative measurements to be made on protein-ligand systems. Dissert. Abstr.

N82-13180 Georgia Univ., Athens.
DOUBLE BEAM-IN-TIME PHOTOACOUSTIC SPECTROSCOPY Ph.D. Thesis
Michael Franklin Cox 1981 149 p
Avail: Univ. Microfilms Order No. 8123045

A unique double beam-in-time photoacoustic spectrometer was constructed which utilizes a vibrating mirror to alternately illuminate sample and reference materials contained in a single cell. Fundamental studies of the photoacoustic signal generated by a single pulse of light were performed. The results demonstrate that the photoacoustic signal deviates from the predicted sawtooth waveform when the pulse duration exceeds approximately 15 milliseconds; primarily due to the response characteristics of the condensor microphone employed. The use of inductively-driven linear scanners in spectroscopic systems, including the double beam-in-time photoacoustic spectrometer, was examined. The presence of chemically-interfering caroxyl groups in a dextran gel, a chromatograhic packing material, was also investigated to demonstrate the utility of the photoacoustic spectrometer. Results indicate that carboxyl groups are likely present in the gel but cannot be effectively eliminated through chemical reduction. Dissert. Abstr.

DETERMINATION OF RADIONUCLIDE SPECIES BY ON-LINE RADIOCHROMATOGRAPHY USING HIGH RESOLUTION GAMMA RAY SPECTROSCOPY Ph.D Thesis
Asok Kumar Dasgupta 1981 192 p
Avail: Univ. Microfilms Order No. 8122412

A high resolution Ge(II) gamma-ray spectroscopy detector for the on-line multielement monitoring of liquid chromatography column effluents containing mixtures of gamma-emitting radionuclides is described. During the chromatogaphic experiments, sequential 0-2048 keV gamma-ray spectra were collected. This technique was successfully applied to the separation and determination of Ni-65(II),Mn-56(II), Co-60(II)Cu-64(II), and diethyldithiocarbamate, oxinated and acetylacetonate of Cr-51(III), CO-60(III),Cu-64(II) and, Mn-56(II) and diethyldithiocarbamate, oxinate, and acetylacetonate of Cu-64(II) by silica gel adsorption chromatography. Dissert. Abstr.

N82-13182 Tennessee Univ., Knoxville.
ELECTROCHEMICAL AND SPECTROSCOPIC STUDIES OF SOME LESS STABLE OXIDATION STATES OF SELECTED LANTHANIDE AND ACTINIDE ELEMENTS Ph.D. Thesis
David Edward Hobart 1981 168 p
Avail: Univ. Microfilms Order No. 8123158

Simultaneous observation of electrochemical and spectroscopic properties (spectroelectrochemistry) at optically transparent electrodes (OTE') is applied to the generation and characterization of some less stable oxidation states of selected lanthanide and actinide elements (Ce, Pr, Sm, Eu, Tb, Yb, U, Np, Am, and Cm) in complexing and noncomplexing aqueous solutions. Optically transparent electrodes used include reticulated vitreous carbon, metal screen OTE's and an OTE made from porous metal foam. Cyclic voltammetry at microelectrodes is used in conjunction with spectroelectrochemistry for the study of oxidation reduction couples. Dissert. Abstr.

SPECTROELECTROCHEMICAL INVESTIGATIONS IN MOLTEN SALT AND AQUEOUS MEDIA Ph.D. Thesis
Vincent Eugene Norvell 1981 203 p
Avail: Univ. Microfilms Order No. 8123171

The electroreduction of the manganese oxyanions in alkaline solutions and the electrooxidation of elemental sulfur and electroreduction of Nb(V) in molten $AlCl_3$ NaCl mixtures was investigated in situ by means of spectroelectrochemical techniques and thin layer coulometry at optically transparent electrodes. The reduction of the maganese oxyanions in alkaline solutions was found to consist of simple reversible one electron transfers when carried out in solutions in which the reduction product is stable. One or more soluble intermediate species, probably containing Mn(IV) and possibly Mn(V) are formed when reduction is carried out in solutions where the product is unstable and undergoes disproportionation. The effect of varying the pH of the solution of the overall reduction process is discussed. Spectral data on the reduction products are presented. Dissert. Abstr.

QUANTITATIVE INVESTIGATIONS OF MIXED OXIDATION STATES OF SOME FIRST ROW TRANSITION METALS IN INSULATOR MATRICES BY PHOTOELECTRON SPECTROSCOPY Ph.D. Thesis
Thomas Michael Rosseel 1981 221 p
Avail: Univ. Microfilms Order No. 8117531

A method using photoelectron spectroscopy quantitatively to determine the oxidation states of titanium, chromium, and manganese in insulator matrices is developed. Metal oxide mixtures which serve as model systems for other types of samples such as lunar basalts and transition metal catalysts were emphasized. It was determined that an extension of the Swartz and Hercules procedure involving standard curves of mixtures of different oxidation states in conjunction with a deconvolution technique. Could sucessfully determine the concentration of oxidation states differing in binding energy by not less than 1.5 eV using the 3P transition if the sensitivity of the measurement could be improved. On approach to improving the sensitivity was to construct and evaluate an electron energy analyzer with a high luminosity. A second approach was qualitatively to map the energy dependence of the 3p photoelectron cross section of determine the energy of maximum atomic sensitivity. In addition to the qualitative energy mapping, the relative 3p photoelectron cross sections, internally referenced to the O 2s cross section, were also determined from 100-150 eV. The relative error of the cross section measurements is estimated to be less than 15%. Dissert. Abstr.

N82-13185 Cincinnati Univ., Ohio.
METAL ION MODIFICATION OF POLYMERIC SULFUR NITRIDE, (SN) SUBX, ELECTRODES AND ELECTROCHEMICAL REDUCTION OF ACETYLENE AT A MOLYBDENUM MODIFIED (SN)SUB X ELECTRODE Ph.D. Thesis
Judith Faye Rubinson 1981 142 p
Avail: Univ. Microfilms Order No. 8123779

The surfaces of electrodes made from the polymeric conductor polymeric sulfur nitride (also known as polythiazyl or (SN) sub x is modified with the metal ions chromium, iron, and molybdenum. Using molybdenum modified (SN) sub x, the direct electrochemical conversion of acetylene to ethylene is accomplished, and the effects of variation of reaction conditions on the rate of conversion is investigated. Also a method for the assembly of film electrodes is developed, thereby enabling the electrode areas to be dramatically increased. The conversion of acetylene to ethylene in aqueous solution, with small amounts of ethane also being produced, is accomplished at (SN) sub x that has been dipped in a concentrated aqueous solution of sodium molybdate. A negative electrode potential of -1.3 V vs the standard calomel electrode is necessary for measurable rates of conversion, with more negative potentials increasing the rate. Dissert. Abstr.

DEVELOPMENT AND TESTING OF DRY CHEMICALS IN ADVANCED EXTINGUISHING SYSTEMS FOR JET ENGINE NACELLE FIRES Final Report
Robert L. Altman, A. Campbell Ling, ed., Ludwig A. Mayer, and Donald J. Myronik Sep. 1979 314 p
(Grant NsG-2165)
(NASA-CR-165011) Avail: NTIS HC A14/MF A01 CSCL 21B

The effectiveness of dry chemical in extinguishing and delaying reignition of fires resulting from hydrocarbon fuel leaking onto heated surfaces such as can occur in jet engine nacelles is studied. The commercial fire extinguishant dry chemical tried are sodium and potassium bicarbonate, carbonate, chloride, carbamate (Monnex), metal halogen, and metal hydroxycarbonate compounds. Synthetic and preparative procedures for new materials developed, a new concept of fire control by dry chemical agents, descriptions of experiment assemblages to test dry chemical fire extinguishant efficiencies in controlling fuel fires initiated by hot surfaces, comparative testing data for more than 25 chemical systems in a 'static' assemblage with no air flow across the heated surface, and similar comparative data for more than ten compounds in a dynamic system with air flows up to 350 ft/sec are presented. S.L.

SOLUBILITIES OF DISSOLVED GASES IN SEA WATER Final Technical Report
Bruce B. Benson and Daniel Krause, Jr. 18 Nov. 1980 15 p refs
(Contract N00014-78-C-0198)
(AD-A100675) Avail: NTIS HC A02/MF A01 CSCL 08/10

The concentration of an atmospheric gas in water in equilibrium with air was measured making corrections for molecular interactions in the vapor phase. The results for oxygen show that the UNESCO tables for the solubility of oxygen give values in freshwater that are low by from 0.15% to 0.35% depending upon temperature. The solubility of hydrogen was determination in pure water and is sea water. Results give very accurate values of oceanograhic and limnological work and are expeciia especially significant becuase of the information provided about the properties of liquid water. The dependence of solubility on salinity and the functional dependence of the salting-out coefficient upon temperature are discussed. J.M.S.

POWER-PLANT FLY-ASH UTILIZATION: A CHEMICAL-PROCESSING PERSPECTIVE
G. Burnet and M. J. Murtha 1981 12 p refs Presented at the Portland Cement Assoc. Conf. on Manufacturing Process, Albuquerque, N. Mex., 14-15 Jan. 1981 Prepared jointly with Iowa State Univ. of Science and Technology
(Contract W-7504-eng-82)
(DE81-025452; IS-M-321; CONF-810151-1) Avail: NTIS HC A02/MF A01

Solid wastes from coal combustion, including fly ash, are classified as hazardous under present EPA definitions. Research on fly ash utilization including extraction of metals and uses for process residues is discussed. One process investigated uses a lime-soda sinter method to form soluble aluminate compounds from mixtures of fly ash, limestone, and soda ash. The aluminates are extracted, treated to remove silicates, and precipitated; the precipitate is calcined to metallurgical grade alumina. The extract residue shows promise as a raw material for the production of Portland cement. Process economics, effects of alumina and silica contents of the fly ash, sintering temperatures and time, and sales credits for by-products are discussed. DOE

HIGH-TEMPERATURE MEASUREMENTS OF ALKALI LEVELS IN AN EXPERIMENTAL 6-INCH AFBC
R. J. Anderson, U. Grimm, and R. R. Romanosky Feb. 1981 15 p refs
(DE81-023632; DOE/METC/RI-188) Avail: NTIS HC A02/MF A01

Alkali metals (K and Na) were measured with an on-line atomic emission (AE) spectrometer in the effluent stream of an atmospheric fluidized-bed combustor (AFBC). To simulate performance of a pressurized fluidized-bed combustor dolomite was used for the bed material and Pittswick coal was burned. The on-line AE unit monitored a representative fraction of the effluent stream. The sample stream was provided by a specially designed system fabricated of Hastalloy X. To control particle size the sample system contained a cyclone having a cut-off diameter of 1 micron. Flow was regulated by controlling the pressure of the freeboard from 0 to 20 inches of water. In all tests a ratio of K to Na of about 3 to 1 was observed. This ratio was verified by analysis of aerosol samples. Concentrations of alkali were about an order of magnitude higher than those measured by the AE unit. Alkali levels (K and Na) on the order of 10 ppM were measured on the sample stream. DOE

STUDIES OF PHOTOIONIZATION IN LIQUIDS USING A LASER TWO-PHOTON IONIZATION CONDUCTIVITY TECHNIQUE
K. Siomos (Tennessee Univ., Knoxville) and L. G. Christophorou (Tennessee Univ., Knoxville) 1981 5 p refs Presented at the 7th Intern. Conf. on Conduction and Breakdown in Dielectric Liquids, Berlin, 27 Jul. 1981
(Contract W-7405-eng-26)
(DE81-026514; CONF-810734-2) Avail: NTIS HC A02/MF A01

One-photon ionization studies of solute molecules in a liquid medium are limited by the absorption of the medium. A laser two-photon ionization technique using a frequency tunable dye laser was developed, whereby the photoionization threshold of a solute molecular was determined from the induced conductivity in a liquid-medium due to electron-ion pair formation solute. The two-photon induced electron-ion current is measured as a function of the laser wavelength. The photoionization of N,N,N,N-tetramethyl-p-phenylendiamine pyrene and fluoranthene in liquid n-pentane are discussed. DOE

PREPARATION AND CHARACTERIZATION OF HYDROGENATED AMORPHOUS SILICON Final Technical Report, 1 Jun. 1980 - 31 May 1981
T. M. Donovan 21 Aug. 1981 22 p refs Prepared for Midwest Research Inst., Golden, Colo.
(Contract DE-AC02-77CH-00178)
(DE81-030973; SERI/TR-8142-4-T3) Avail: NTIS HC A02/MF A01

The deposition and characterization of dc magnetron sputtered amorphous silicon hydride and an evaluation of its potential as a solar material is summarized. Infrared vibrational spectra of films deposited in the 200 to 3000C temperature range show that hydrogen incorporated mainly as SiH. Doping with nitrogen or phosphorus is ineffective in increasing conductivity or photoconductivity. During deposition, dc bias of the substrate is successful in reducing interface contamination and improving the coalescence of the condensing Si. High levels of defects or dangling bonds are inferred from both optical and transport measurements made on bias deposited, single mode, structurally homogeneous SiH films. DOE

REDUCTION OF NITRIC OXIDE IN A FLUIDIZED BED Final Report
Z. Huang, G. T. Chen, and C. Yi Wen Jul. 1981 69 p refs
(Contract DE-AT21-79MC-11284)
(DE81-030488; DOE/MC-11284/1100) Avail: NTIS HC A04/MF A01

Reduction of nitric oxide (NO) by two kinds of char, coke, carbon monoxide and methane was investigated in a bed of glass sand fluidized by nitrogen containing a small amount of nitric oxide. The bed was heated externally by an electric heater and the effect of char loading on NO reduction was studied over a wide range of temperatures. Reactivities of different chars and coke depend upon such physical properties as surface area, porosity, type of char, and carbon content. The reduction of NO with carbon monoxide was also investigated. Results showed that the stainless steel wall exerted a significant catalytic effect on this reaction. To obtain information for design and operation of fluidized-bed combustors, kinetic evaluation of the reaction of NO with Char 1 was performed. Data based on the two-phase bubble model were analyzed to formulated the reaction rate expression, activation energy, and the frequency factor. DOE

A MINIATURE, THIN-FILM THERMAL CONDUCTIVITY DETECTOR FOR AN INTEGRATED GAS CHROMATOGRAPH Ph.D. Thesis
John Hallock Jerman 1981 135 p
Avail: Univ. Microfilms Order No. 8124086

A miniature thermal conductivity detector developed for use in an integrated gas chromatography system is described. The miniature detector is fabricated using integrated circuit processing techniques, and consists of a thin film nickel resistor supported on a Pyrex glass membrane. The Pyrex membrane is supported on its periphery by a silicon substrate chip, which is clamped over an etched detector channel to form the detection volume. The detector volume is more than 5 orders of magnitude smaller than conventional GC thermal conductivity detectors. Nickel is used as the sensing element in the detectors. The detector is preferably operated in a constant temperature configuration in order to reduce the temperature effects of gases and the detector support and to protect the detector from thermal runaway. In the miniature GC system, the detector is capable of detecting gases at less than 1 ppm concentration, in 20 nl samples.

A STUDY OF THE FORMATION AND STRUCTURE OF SMALL CLUSTERS OF NOBLE GASES AND SULFUR HEXAFLUORIDE FORMED IN LAVAL NOZZLE MOLECULAR BEAMS Ph.D. Thesis
Sang Soo Kim 1981 242 p
Avail: Univ. Microfilms Order No. 8124925

Extremely small clusters of the rare gases Ar, Kr, and Xe are studied using electron diffraction. Each gas is expanded in a He carrier gas through a small Laval nozzle. The nozzle is the first stage of a molecular beam. As the gas expands the condensable vapor highly supersaturates and clusters are formed. The structure and properties of very small clusters are significantly different from those of the bulk phase. All cluster formed from mixtures with 6% Kr and 6% Xe in the He carrier gas are icosahedron, with the range of sizes 100 to approximately 300 atoms per cluster. Also, all of the experiments using 6%, to 12.5%, and part of 25% Ar, with He carrier, produce clusters which are icosahedral structures. However, strong patterns at 25% Ar in He (i.e., larger cluster sizes), and 100% Ar expansions produce mixed patterns of the two structures. The cluster temperature range from 20 to 60 K and the cluster beam contains 20 to approximately 50% free atoms. Dissert. Abstr.

SALT REMOVAL FROM BRACKISH WATER BY CONTINUOUS PROCESSES WITH AMPHOTERIC, THERMALLY REGENERABLE ION-EXCHANGE RESINS Ph.D. Thesis
Tah-Ben Hsu 1981 363 p
Avail: Univ. Microfilms Order No. 8123816

Two amphoteric, thermally regenerable ion exchange resins, Amberlite XD 2 and Amberlite XD 5, are utilized to remove salt from brackish water by continouous processes. The physical and chemical properties of both resins are studied, including their resin capacity, density, porosity and swelling phenomena. The kinetic reaction of mass transfer in these resins is studied by means of frequency analysis during forced temperature cycling and also by fixed bed breakthrough experiments. Amberlite XD 2 has a higher mass transfer rate than Amberlite XD 5. A truly countercurrent, continuous adsorption process to remove salt from water is evaluated using theoretical simulation and experimental results. Amberlite XD 2 shows better separation performance than Amberlite XD 5 under the same operation conditions. The linear equilibrium line case, which may be important for dilute concentrations, also is simulated theoretically.
Dissert. Abstr.

TWO STUDIES OF FLUIDIZED BEDS: HEAT TRANSFER AND GRID JETS Ph.D. Thesis
Walter Thompson Ropchan 1981 162 p
Avail: Univ. Microfilms Order No. 8124144

A videotape system as used to record the rise of an injected hot bubble into an incipiently-fluidized bed at ambient conditions. Both the initial temperature and that at a given height were measured for several bubbles. When extrapolated, the data indicate that over 99 percent of the excess heat above ambient is lost within one bubble diameter away from the point of injection. In addition to visual observation, cine-photography was used to record high-speed phenomena around a jet. Three regimes of jet behavior were observed: periodic, meandering, and unstable. A rather elongated bubble in the shape of a jet first pinches off just barely above the orifice. The pinching frequency was found to be determined solely by the gas flowrate. These pinched structures, in turn, break up into bubbles, sometimes coalescing into doublets, triplets, etc. As coalescence phenomena dominate the resulting bubble frequency, a lack of an apparent preference for the type of bubble formed was found. Dissert. Abstr.

PREPARATION, CHARACTERIZATION AND PERFORMANCE OF NON-UNIFORM METAL CATALYSTS Ph.D. Thesis
Yen-Shin Shyr 1980 485 p
Avail: Univ. Microfilms Order No. 8124643

Nonuniformly distributed supported Pt catalyst is prepared by adding NaBr, and/or Ca to chloraplatinic acid impregnating solution. The effect of chemical competitors in the adsorption of the impregnation process was studied. Coingredients included the following acids and salts HCl, HF, HNO3, acetic acid, citric acid, tartaric acid AlCl3, NaCl, NaF, NaBr, NaNO3, NaPO4, Na benzoate, and Na Citrate. Radial Pt profiles were analyzed by electron probe microanalysis. Five catalysts--two with monotonically increasing profiles from bead center to surface, two with monotincally decreasing profiles and one with a uniform profile on the gamma alumina support, and two catalyst-- one with an increasing profile and one with a uniform profile on silica alumina support, were prepared and characterized by electron probe microanalysis and hydrogen chemisorption. The Pt contents ranged from 0.5% to 1.1% as measured by a spectrophotometric method. The Pt particle sizes were determined by H2 chemisorption.
Dissert. Abstr.

SOLUBILITIES IN MULTICOMPONENT SYSTEMS OF NONSPECIFIC INTERACTIONS Ph.D. Thesis
William Eugene Acree, Jr. 1981 155 p
Avail: Univ. Microfilms Order No. 8123580

Solubilities are reported for (1) iodine at 25 C in binary mixtures of carbon tetrachloride with cyclohexane, n-hexane, n-heptane, and octamethycyclotetrasiloxane (OMCTS), mixtures of cyclohexane with n-hexane and with OMCTS, and mixtures of n-hexadecane with n-heptane and with isooctane; (2) benzil in binary mixtures of carbon tetrachloride with cyclohexane, n-hexane, and n-heptane. mixtures of n-hexane cyclohexane and with n-heptane; (3) benzene with cyclohexane and with toluene; (4) stannic iodide in mixtures of carbon tetrachloride and cyclohexane, and (5) benzoic acid in binary mixtures of carbon tetrachloride with cyclohexane n-hexane, and n-heptane, binary mixtures of cyclohexane n-hexane and n-heptane; and for ternary mixtures of carbon tetrachloride + cyclohexane n n-hexane, + n heptane. Solubilites are also reported for benzoic acid in several binary solvent mixtures at 30 C and for m-toluic acid at 25 C in binary mixtures of cyclohexane and n-hexane.
Dissert. Abstr.

N82-13206 Missouri Univ. -Rolla.
MOLECULAR INTERACTIONS IN AMPHIPHILIC ASSOCIATION STRUCTURES Ph.D. Thesis
Beverly Bendiksen 1981 115 p
Avail: Univ. Microfilms Order No. 8123586

The interactions of water, a surfactant, and cosurfactant in microemulsion systems were studied by experimental and theoretical means. Intermolecular bond strengths in pre-micellar aggregates of surfactant, cosurfactant, and water were calculated using semiempirical molecular orbital theory by the method of the CNDO/2 program. The stability of pre-micellar aggregates in a nonpolar continuous medium was estimated using a thermocycle, and the onset of inverse micelle formation was predicted. The four component phase diagram of water - octanoic acid - sodium octanoate - carbon tetrachloride was explored and the phase behavior of the inverse micellar region explained using infrared spectrophotometry and molecular weight determinations. Dissert. Abstr.

N82-13207 Polytechnic Inst. of New York, Brooklyn.
POTENTIAL USE OF THE MINICOMPUTER CONTROLLED POWDER DIFFRACTOMETER FOR THE STRUCTURE DETERMINATION OF SMALL QUANTITIES OF RATHER IMPURE MATERIALS Ph.D. Thesis
Ronald Jenkins 1981 157 p
Avail: Univ. Microfilms Order No. 8118879

Minicomputer controlled diffractometer for routine powder diffractometry is investigated. Mixed tetra-fluorides of Europium, Magnesium and Strontium are used. Structures are determined on 50 mg. aliquots of EuMgF4, SmMgF4 and SrMgFd4 with sample purity generally in the 80 percent to 90 percent region. Cell parameters are determined to about 6 parts in 10,000. All three materials are found to be isostructural, each being orthorhombic with four formula units per unit cell. Dissert. Abstr.

N82-13208 Rensselaer Polytechnic Inst., Troy, N. Y.
SPECTROELECTROCHEMISTRY, FLASH PHOTOLYSIS AND PHOTOGALVANIC EFFECT OF METHYLENE BLUE AND SAFRANIN-O Ph.D. Thesis
Charles Edward Baumgartner 1981 275 p
Avail: Univ. Microfilms Order No. 8121137

Organic dyes are often employed in chemical, photochemical, or electrochemical redox reactions which require a visible color change between reactant and product. Two such dyes, methylene blue (3,7-dimethyl-amino-phenothiazine chloride) and safranin-O (2,8-dimethyl-3,7-diamine-phenazinium chloride) were investigated; their photochemistry being characterized by xenon flash photolysis and electrochemistry being monitored by various spectroelectrochemical techniques. In addition, the photogalvanic effect in the safranin-O/ethylenediaminetetraacetic acid photosystem was characterized with respect to participant concentrations. Spectroelectrochemical techniques of attenuated total reflectance spectroscopy, optically transparent thin layer electrochemical spectroscopy, and multiple specular reflection spectroscopy were employed to optically monitor dye reduction and leucodye oxidation. Xenon flash photolysis was employed to dye triplet states and semireduced free radicals resulting from photoreduction with various reducing agents. Dissert. Abstr.

N82-13209 Georgia Inst. of Tech., Atlanta.
STUDIES OF SAMPLE INTRODUCTION FOR INDUCTIVELY COUPLED PLASMA EMISSION SPECTROMETRY Ph.D. Thesis
Andrew William Boorn 1981 224 p
Avail: Univ. Microfilms Order No. 8124281

Pneumatic nebulization of a liquid sample, to produce an aerosol which is injected into the plasma is the most commonly employed method of sample introduction for the ICP, and was investigated in detail. It is found that the pneumatic nebulization process is approximately 1% efficient, and that the mechanism of aerosol transport to the plasma is not well characterized. If the efficiency of nebulization, an hence detection limit, is to be improved, the aerosol transport mechanism must be known. This mechanism was studied by use of Andersen cascade impactor to collect the aerosols produced by pneumatic nebuilzers. It was found that while the nebulizers produce droplets having a median diameter in the rate 50-150 micrometer, the median droplet size reaching the plasma is 2-4 micrometers. The major process influencing droplet transport efficiency are found to be gravitational setting an impaction, which reduce transport efficiency, and evaporation which increases the amount of sample reaching the plasma. Dissert. Abstr.

FATIGUE CRACK INITIATION AND ELECTROCHEMICAL BEHAVIOR OF 403 STAINLESS STEEL IN AQUEOUS ENVIRONMENTS Ph.D. Thesis
Hamdy Mohamed Mourad Shalaby 1981 315 p
Avail: Univ. Microfilms Order No. 8121854

The fatigue crack initiation characteristics and the electrochemical behavior of quenched and tempered Type 403 stainless steel is studied in several environments. The tests are conducted in air, in deaerated distilled water, and in deaerated aqueous solutions of chloride, sulphate, phosphate, hydroxide, and silicate anions across a range of pH levels. Slight pitting occurs on the electrode surface after measurement of anodic polarization curves in 0.01M sulphate solutions, while crevice attack occurs in 1.0M solutions of pH's 7 and 10 at 100 C. The pitting corrosion in neutral and alkaline solutions of sodium sulphate has the same character as pitting of steel in sodium chloride solutions. Crevices are preferred sites for pitting, which later transform into severe crevice corrosion. Surface preparation factors have a profound effect on the nucleation of localized attack on 403 stainless steel in sodium sulphate solutions at 100 C. Dissert. Abstr.

N82-13211 Stanford Univ., Calif.
ACOUSTIC NONDESTRUCTIVE EVALUATION OF MICROSTRUCTURE Ph.D. Thesis
Nasser Bozorg-Grayeli 1981 221 p
Avail: Univ. Microfilms Order No. 8124042

Acoustic velocity and attenuation was measured in pure copper specimens with different grain sizes. The attenuation was found to be a mixture of stochastic and Rayleigh grain scattering. The measured acoustic attenuation was in good agreement with quantitative predictions based on the scattering theories of Lifshits and Parkhomovski. These experiments demonstrated the feasibility of grain size assessment by nondestructive acoustic attenuation measurement. Velocity and attenuation measurements were made on plain carbon and low alloy steels heat treated to have pearlite/ferrite, bainite, and martensite microstructures. For any given steel composition, velocity was lowest in martensite, initermediate in bainite, and highest in pearlite/ferrite. In a 76mm round bar of 304 stainless steel, variations in acoustic velocity and attenuation depended upon grain size and texture as predicted by acoustic theory. The acoustoelastic constant varied with radial position apparently because of the texture gradient. Dissert. Abstr.

CYCLIC DEFORMATION AND FATIGUE CRACK INITIATION OF A COHERENTLY PRECIPITATING NI-14.4 AT % Al ALLOY Ph.D. Thesis
Donald Louis Anton 1981 222 p
Avail: Univ. Microfilms Order No. 8124843

An inverse exponential equation was found to model the transient cyclic hardening behavior of all specimens tested. An empirical constant, R, was observed to change significantly with precipitate size, having a maximum value for the peak aged specimen and decreasing substantially as both under and over aging became more severe. Further analysis of this equation showed that the cyclic hardening rate was proportional to the term R. Microstructural examination illustrated that more uniform plastic deformation occurred during early cyclic straining of the peak aged material than in either the under or over aged cases. Furthermore, initial paired dislocation motion was replaced by unpaired tangles and a mottling of the dark field images of the precipitates. A mechanism, conforming with the microstructural evidence, is proposed to explain the substantial cyclic hardening based on the accumulated back and forth motion of dislocations through the precipitates. Dissert. Abstr.

FATIGUE CRACK PROPAGATION STUDIES IN TWO CRYOGENIC STEELS Ph.D. Thesis
Hyong Jun Choi 1981 176 p

Avail: Univ. Microfilms Order No. 8124867

Fatigue crack growth rates were studied at low and intermediate stress intensity levels for two intercritically tempered cryogenic steels, Fe-9Ni-0.1C and Fe-4Mn-0.15C. Propagation rates were determined for varying intercritical tempering time corresponding to varying amounts of retained austenite, untempered martensite and varying degree of ferrite matrix recovery. In stage 2, the law da/dN = C (delta K)(m) was observed for all cases with coefficient m aprox. = 3.5. It was found that the heat treatments that optimize impact fracture properties in these steels are also beneficial with respect to da/dN in stage 1, while no beneficial effect at all was observed for stage 2. Moessbauer spectroscopy results indicate that the retained austenite in the rack path is transformed to martensite as was earlier shown for Charpy specimens. Auger composition analysis indicate a tendency for a stage 1 crack tip to avoid the mechanically induced brittle untempered martensite while no such preference was observed for stage 2 or when the microstructure had a less distinct separation of hard and soft phases. Dissert. Abstr.

AN INVESTIGATION OF NOTCH LOW CYCLE FATIGUE LIFE BEHAVIOR OF RENE' 80 AT HIGH TEMPERATURE Ph.D. Thesis

Paul Allen Domas 1981 243 p
Avail: Univ. Microfilms Order No. 8123748

The cyclic stress-strain behavior of circumferentially notched bars was an elastic-plastic finite element computer model analyzed using to investigate cyclic material response at the notch roof. Low cycle fatigue tests on smooth and notched bars of the cast nickel-base superalloy, Rene'80 in the temperature range of 760 C to 982 C (1400 F to 1800 F) were conducted to provide test data for comparison to analytic predictions and the failed specimens were studied by optical, scanning, and transmission electron microscopy. A predictive technique incorporating the parameter of strain energy density integrated over a dissipative volume at the notch root was developed. Correlation of predicted results for circumferentially notched cylindrical bars and experimental data was found. The influence of material behavior as manifest in damage/deformation mechanisms was particularly evident in that an oxidation process was identified as the principal cause of failure at 982 C (1800 F). Dissert. Abstr.

N82-13215 Cincinnati Univ., Ohio.

SUBSTRUCTURE OF 316 STAINLESS STEEL PIPE WELDMENTS Ph.D. Thesis

Jude Reynold Foulds 1981 264 p
Avail: Univ. Microfilms Order No. 8123752

Weldment sections from 'formed and welded' large diameter 316 stainless steel pipe for structural use in the hot-leg of the liquid metal fast breeder reactor (LMFBR) were characterized microstructurally primarily through TEM. The weld metal dendritic substructure appears as a dislocation substructure with low-angle boundaries (< misorientation) demonstrated to be stable on reannealing and built up on interdendritic planes of mismatch. The weld and parent metal exhibit distinctly different elevated temperature recovery characteristics proposed to be chiefly responsible for the generally observed weld/parent metal differences in elevated temperature time-independent and-dependent mechanical behavior. The GTA weld shows a low ferrite content (-2%) with globular morphology uncharged on reannealing. The SA weld shoes no ferrite (susceptible to hot-cracking), an undesirable large columnar grain size, a distinct weld centerine at least on the inside bead, and the extensive occurrence of slag inclusion. Dissert. Abstr.

INVESTIGATION INTO THE ROLE OF NaCl DEPOSITED ON OXIDE AND METAL SUBSTRATES IN THE INITIATION OF HOT CORROSION Semiannual Report, 1 Apr. - 1 Oct. 1981

N. Birks 1 Oct. 1981 24 p
(Grant NAG3-44)
(NASA-CR-165029; SAR-3) Avail: NTIS HC A02/MF A01 CSCL 11F

Morphological aspects of the conversion to Na2SO4 of NaCl deposits over the temperature range 500-700 C, in air with added SO2 and H2O. Progress of the reaction was observed by withdrawing samples at various times and examining them under the scanning electron microscope using EDAX to assess the extent of chloride to sulfate conversion. These initial results show that the conversion to Na2SO4 proceeds directly on the sodium chloride surface as well as on the surrounding substrate due to evaporation of NaCl from the solid particle. The mechanism of this reaction could involve reaction in the vapor to produce Na2SO4 which then deposits, alternatively Na2SO4 could form directly on the substrate surface due to direct reaction there between the vapors NaCl, SO2 and O2. A QUANTITATIVE STUDY OF FACTORS INFLUENCING LAMELLAR EUTECTIC MORPHOLOGY DURING SOLIDIFICATION

W. F. S. Kaukler Nov. 1981 263 p refs
(NASA-TM-82451) Avail: NTIS HC A12/MF A01 CSCL 11F

The factors that influence the shape of the solid-liquid interface of a lamellar binary eutectic alloy are evaluated. Alloys of carbon tetrabromide and hexachloroethane which serve as a transparent analogue of lamellar metallic eutectics are used. The observed interface shapes are analyzed by computer-aided methods. The solid-liquid interfacial free energies of each of the individual phases comprising the eutectic system are measured as a function of composition using a 'grain boundary groove' technique. The solid-liquid interfacial free energy of the two phases are evaluated directly from the eutectic interface. The phase diagram for the system, the heat of fusion as a function of composition, and the density as a function of composition are measured. The shape of the eutectic interface is controlled mainly by the solid-liquid and solid-solid interfacial free energy relationships at the interface and by the temperature gradient present, rather than by interlamellar diffusion in the liquid at the interface, over the range of growth rates studied. LASER HEAT TREATMENT OF TRACK COMPONENTS IN COMBAT VEHICLES, PHASE 1 Final Report, 26 Sep. 1979 - 26 Sep. 1980

D. S. Gnanamuthu and R. J. Moores Jun. 1981 98 p
(Contract DAAK30-79-C-0136)
(AD-A102761; SC5248.12FR) Avail: NTIS HC A05/MF A01 CSCL 11/6

Abrasive wear locations in end connectors and center guides used in combat vehicles were precision heat treated with a continuous wave CO2 laser beam. Self quenched casings 3 to 4 mm deep, with predominantly martensitic microstructure of hardness between Rc 50 to 54, were observed. Coverage rates up to 90 mm/s were obtained. Abrasive wear tests revealed that laser heat treated specimens had smaller wear scar dimensions than untreated specimens. In a 9 mm thick AISI 4140 steel plate, case depth of 6.5 mm was obtained. Heat treatment was conducted with laser beam power of 4000 to 5000 W, with the beam shaped by a three-mirror optical tooling to provide a uniformly intense beam of size 19 x 19 mm. with this optical tooling, a stand-off distance of 445 mm between beam directing mirror and work surface was available. Laser heat treating cost estimates for an end connector were found to be $0.60 and for a center guide $0.69. Specifications and cost estimates for a prototype laser heat treating facility were developed. Author

MECHANISMS BY WHICH HUMIDITY ALTERS DUCTILITY Annual Technical Report, 15 Apr. 1980 - 14 Apr. 1981

W. L. Morris, M. R. James, and R. V. Inman Sep. 1981 56 p refs
(Contract N00014-79-C-0034)
(AD-A105530; SC5211.2AR) Avail: NTIS HC A04/MF A01 CSCL 11/6

The ductility of surface of Al 2219-T851 has been measured in two regimes of plastic strain. In the small strain regime, we determined the microplastic strain which develops within individual grains, at the surface, during fatigue at cyclic stress amplitudes substantially below the bulk yield strength. Initially the deformation is elastic; but, with increasing fatigue, local plastic strains under tensile load develop within individual grains and can approach 0.5%. It is these plastic strains which lead to crack initiation at the surface. The measurement technique is described, and data are presented for two different heats of 2219 taken in dry and in humid air. These materials are thought to differ substantially in as-received hydrogen content. It appears from our results that internal hydrogen increases the rate of development of microplasticity at the surface during fatigue, accelerating crack initiation. The role of surface oxide in determining surface ductility is complex, and is apparently a function of the internal hydrogen content of the alloy. In the large strain regime, the ductility of the surface is assessed by measuring the opening displacements of the tips (CTOD) of small surface cracks. GRA

EFFECT OF LOW-TEMPERATURE IRRADIATION WITH (n, ALPHA) HELIUM PRODUCTION ON TENSILE PROPERTIES OF 12 Cr-1 Mo VW-TYPE STEELS

R. L. Klueh, J. M. Vitek, and M. L. Grossbeck 1981 5 p refs Presented at the Fusion Reactor Mater. Meeting, Seattle, 9 Aug. 1981
(Contract W-7405-eng-26)
(DE81-028578; CONF-810831-10) Avail: NTIS HC A02/MF A01

Tensile specimens for small heats of ferritic (martensitic) steel irradiated in the High Flux Isotope Reactor (HFIR) to displacement damage levels. Transmutation of Ni by thermal neutrons during irradiation in HFIR leads to helium production rates similar to those anticipated in a fusion reactor. Displacement damage is produced simultaneously by fast neutron flux in the reactor. After irradiation, specimens were tested at room temperature and 3000 C. Yield strength and ultimate tensile strength of irradiated samples displayed considerable hardening over the unirradiated condition. DOE

NEW WAYS OF LOOKING FOR PHASE TRANSITIONS AT MULTI-MEGABAR DYNAMIC PRESSURES

J. W. Shaner 1981 11 p refs Presented at the Conf. on High Pressure Phys., Bad Honnef, West Germany, Aug. 1981
(Contract W-7405-eng-36)
(DE81-028771; LA-UR-81-2082; CONF-810828-4) Avail: NTIS HC A02/MF A01

Three new techniques were applied to thermodynamic measurements behind a shock wave. Optical pyrometry was used to measure the temperature of shocked SiO2. A temperature anomaly was found, indicating a phase change, probably melting, between 0.6 and 1.1 Mbar. Magnetic probes were used to measure the velocity of sound in shock compressed metals. Loss of a longitudinal elastic component of the sound wave is indicative of melting. An optical analyzer technique, exploiting the sensitivity of thermal radiation to small temperature changes, was used to measure sound velocity in shock compressed metals. With this derivative measurement both solid-solid and melting transitions of iron were detected. DOE

OPTICAL POLISHING OF METALS

N. J. Brown, P. C. Baker, and R. T. Maney 29 Jul. 1981 16 p refs Presented at SPIE Intern. Symp., San Diego, 24 Aug. 1981
(Contract W-7405-eng-48)
(DE81-028690; UCRL-86514; CONF-810810-17) Avail: NTIS HC A02/MF A01

Metal polishing and fixed charge lap models are presented. Surface roughness of metals simultaneously polished on the same lap tended to vary inversely with Young's modulus. Electroless nickel wear rates with diamond, silicone oil, and pitch varied linearly with pressure and abrasive travel. Wear rates for the few samples run did not necessarily vary with just Young's modulus or hardness. It was not clear whether rates vary linearly with particle size. There was a distinct difference in the behavior of diamond and alumina on pitch laps. Alumina produced rougher surfaces than the corresponding size diamond on electroless nickel. There was a distinct difference between water and silicone oil as fluid lubricants on pitch laps. Roughness distributions on metals yielded Gaussian histograms for depth even on the smoothest specimens measured (similar effects are seen in glass). Data to support the above are provided. DOE

INSOLUBLE ANODES FOR ELECTROWINNING ZINC AND OTHER METALS

E. R. Cole, Jr. and T. J. OKeefe May 1981 31 p refs

(PB81-227365; BM-RI-8531) Avail: NTIS HC A03/MF A01 CSCL 11F

The polarization behavior of Pb-Ag anodes in H2SO4 and fluoride solutions was determined as the first step in the development of such an anode. A Luggin capillary, dc power supply, high-impedance voltmeter, and other equipment standard to an electrochemical laboratory were used. During polarization, a relatively hard, stable coating of PbO2 was formed on the surface of the lead-silver anode. The rate of formation was enhanced by the presence of fluoride ions in solution. Subsequent investigations resulted in the development of a PbO2-coated titanium anode. Additional data resulting from extensive testing of the anodes, as well as process improvements and innovations, are included. GRA

N82-13228 Ohio State Univ., Columbus.

STRESS CORROSION CRACKING OF TYPE 304 STAINLESS STEEL IN HIGH TEMPERATURE DILUTE CHLORIDE SOLUTION Ph.D. Thesis

Lifun Lin 1981 142 p

Avail: Univ. Microfilms Order No. 8121821

The susceptibility of sensitized type 304 stainless steel to stress corrosion cracking (SCC) in high temperature dilute chloride solution was studied using slow strain rate technique. When the electrode potential was more noble than a critical potential, intergranular stress corrosion cracking (IGSCC) was observed. At temperatures equal to or higher than 150 C simultaneous IGSCC and TGSCC occur when the potential was above that for passivation breakdown. At temperatures below 150 C, IGSCC is accompanied by the occurrence of pitting potential. The activation energy for intergranular crack propagation is equal to 7 + or - 3 Kcal/mole. This indicates that the crack growth is controlled by mass transport process. It was found that using slow strain rate test, the total time to failure for a sensitized type 304 stainless steel was predominated by the initiation of an active crack. The threshold potential for arresting a propagating crack coincides with the critical potential for IGSCC obtained on originally smooth specimens. Dissert. Abstr.

N82-13229 Stanford Univ., Calif.

STRENGTHENING PHASES AND DEFORMATION MECHANISMS IN DISPERSION STRENGTHENED SOLID SOLUTIONS AND PURE METALS Ph.D. Thesis

Warren Carl Oliver 1981 150 p

Avail: Univ. Microfilms Order No. 8124124

The processing of aluminum powders to produce dispersion strengthened (DS) aluminum is studied. The dispersoid structures that form during mechanical alloying of aluminum is investigated, and structural changes that occur during subsequent heating are observed. Aluminum is produced by mechanical alloying (high energy ball milling) and subsequent hydrostatic extrusion. Mechanical properties of DS aluminum alloys, DS AlMg alloy, in particular are studied to observe the combined effects of dispersion strengthening and solute strengthening. The deformation characteristics of DS Al and DS AMg determined using constant crosshead speed compression tests and constant stress creep tests. Hard particles eliminate solute drag conrolled dislocation motion as a rate controlling mechanism for deformation. Even at relatively low temperature, the oxide particles in these alloys may deform and the deformation of the particles controls the deformation of the alloy. Dissert. Abstr.

N82-13230 Northwestern Univ., Evanston, Ill.

CYCLIC DEFORMATION AND FATIGUE MICROCRACK INITIATION IN PEARLITIC EUTECTOID STEEL Ph.D. Thesis

Hyun Sunwoo 1981 147 p

Avail: Univ. Microfilms Order No. 8125018

The cyclic softening and hardening behavior and the dislocation structural changes during cyclic deformation in a pearlitic eutectoid steel with variable interlamellar spacing is investigated, using controlled strain aging experiments. Transmission electron microscopic (TEM) observations are made on foils prepared from uncycled and cycled specimens. The initiation modes of surface fatigue microcracks are also examined by TEM using replicas and directly with scanning electron microscopy. The cyclic deformation behavior strongly depends on the interlamellar spacing with cyclic softening in the fine pearlite, cyclic hardening in the coarse pearlite, and both cyclic softening and hardening at low and high strain amplitudes, respectively, in the medium pearlite. Dissert. Abstr.

N82-13231 Northwestern Univ., Evanston, Ill.

DEFORMATION-ENHANCED PHOTOEMISSION FROM METALS Ph.D. Thesis

Tiruchengodu Krishna Ganapathy Swami 1981 145 p

Avail: Univ. Microfilms Order No. 8125019

Plastic deformation enhanced UV photoemission from oriented single crystal surfaces of aluminum is studied. Clean aluminum single crystals oriented in /111/direction are flexurally fatigued under ultrahigh vacuum conditions and for the first time photoelectron energy distribution curves are obtained as a function of fatigue cycles using the HeI(21.2 eV) and the HeII(40.8 eV) photon lines. A progressive decrease in work function is observed as the specimen is subjected to increasing number of fatigue cycles. Deformation enhanced photoemission behavior of oxide covered aluminum and other metals is also investigated using photons from a mercury arc lamp (photon energy 5.0, 5.1 or 5.2 eV). Initially, Al(100) and Al(111) faces are exposed to oxygen and the photocurrent measured as a function of exposure. On both the faces photocurrent increases initially, reaches a maximum and then starts to fall very slowly with oxygen exposure. Dissert. Abstr.

N82-13232 Florida Univ., Gainesville.

MATHEMATICAL MODEL OF DIFFERENTIAL REFLECTOMETRY FOR USE IN THE INVESTIGATION OF THIN FILM CORROSION PRODUCTS Ph.D. Thesis

Frank Karl Urban, III 1981 173 p

Avail: Univ. Microfilms Order No. 8124460

Maxwell's equations without any simplifying assumptions were used in a model developed to produce computer calculated differential reflectograms (difference in reflectivity as a function of photon energy) which were compared with experimentally obtained reflectograms. The calculated differential reflectograms are distinguished by a sequence of interference peaks if the product of film thickness and index of refraction of the corrosion product film is greater than 40 nanometers. For an oxide film thickness below this critical value, no interference peaks are expected. High purity tungsten was chosen for the primary experimental thrust. Chromium, molybdenum, zinc, magnesium and copper also were investigated. Matching the calculated and experimental reflectograms leads to the identification of the source of each peak, the establishment of the interband peak energies and the determination of optical constants and thicknesses of the film. Dissert. Abstr.

A STUDY OF THE SURFACE REACTIVITY OF SILVER: AN ACID BASE CHARACTERIZATION OF OXIDATION REACTIONS Ph.D. Thesis

Mark Alan Barteau 1981 474 p

Avail: Univ. Microfilms Order No. 8124031

The absorption of oxygen on the Ag(110) surface and the reactions of oxygen with organic compounds were examined. Above 150K oxygen was dissociatively adsorbed on the surface, below this temperature an adsorbed molecular species was also present. The reactivity of adsorbed oxygen atoms was characteristics of an acid-base reaction. Adsorbed bases included formate, acetate, mono-dentate acetylide, bi-dentate acetylide, and hydroxyl. These species could be stoichiometrically titrated from the surface by stronger acids to yield the parent acids plus the adsorbed conjugate base of the stronger acid. The order of acidity on the Ag(110) surface was determined to be: 1,2 formic acid, acetic acid; 3 ethanol; 4 acetylene; 5 methanol; 6,7 water, propylene; 8,9,10 hydrogen ethylene, ethane. Little perturbation of the orbitals expected for gas phase anions was observed to arise from the interaction with the surface. Dissert. Abstr.

POLYMERS WITH MESOMORPHIC ORGANIZATION IN THE SIDE CHAINS FROM VINYL MONOMERS WITH MESOGENIC OR POTENTIALLY MESOGENIC ELEMENTS Ph.D. Thesis
Lee-Kiat Lim 1981 172 p
Avail: Univ. Microfilms Order No. 8124825

Monomers and their saturated analogs containing mesogenic or potentially mesogenic elements in the side chains were synthesized. Polymerization of the monomers was carried out in the mesomorphic and isotropic melt states and in solution. The polymers prepared were characterized by means of IR, viscometry, TMA, C13-NMR, X-ray diffraction and polarizing microscopy. Polymerization of MBABA in the mesomorphic phase was found to influence polymer tacticity. Polymerization of non-mesomorphic MBnBA resulted in a polymer exhibiting enantiotropic mesomorphism. Differential scanning calorimetry was evaluated and found to be a useful new tool for the determination of polymerization rate. Dissert. Abstr.

N82-13235 Polytechnic Inst. of New York, Brooklyn.
STUDIES OF POLYMER COMPATIBILITY BY NONRADIATIVE ENERGY TRANSFER Ph.D. Thesis
Ju-Ming Hung 1980 135 p
Avail: Univ. Microfilms Order No. 8118877

The excitation energy of a donor can be transferred to an acceptor when the emission spectrum of the donor overlaps the absorption spectrum of the acceptor. Polymers were prepared containing the comonomers, 2-(N-carbazolyl)ethyl methacrylate and 9-anthrylmethyl methacrylate as fluroescence donors and acceptors, respectively. The mutual interpenetration of the polymer chains carrying the donor and the acceptor led to a sharp increase of excitation energy transfer characterized by the relative emission intensities at 347 nm and 413 nm, the emission maxima of the carbazolyl and the anthryl chromophores, when the system was irradiated at 296 nm. The critical transfer distance R0 = 2.7 nm to 2.9 nm was calculated from spectroscopic parameters. However R0 = 3.6 nm was obtained from the quenching of the donor fluorescence at increasing acceptor concentrations when 2-(N-carbazolyl)ethyl acetate and 9-anthryl methyl acetate were incorporated in polymer films. The polymer blends of poly(styrene co acrylonitrile) with poly(methyl methacrylate) were studied by energy transfer method. The angle of compatibility indicated by the fluroescence technique was similar, but slightly narrower than estimated from the optical clarity. Dissert. Abstr.

FLAMMABILITY AND PHOTO-STABILITY OF SELECTED POLYMER SYSTEMS Ph.D. Thesis
Jeelin Lo 1981 142 p
Avail: Univ. Microfilms Order No. 8118883

A systematic approach to the improvement of the flammability of epoxy resins, bisphenol-A polycarbonate, poly(butylene terephthalate), and Nylon 6.6 by introducing halogens and loop functionality into the flame retardants is described. The investigation of the thermal properties of the char-forming phenol-formaldehyde resins was conducted to provide information for the systematic design of high temperature flame-resistant phenolics. The differences in structure of the cured resins were observed from the FT-IR spectra. The s-trioxane cured resins contain long chain ethers and cyclic acetals along with the methylene linkages. In the study of the photo-Fries rearrangement the fluorene-based polyarylates prepared included 9.9-bis (4-hydroxy phenly) fluorene isophthalate (BPF-I), 9.9-biscresol fluorene isophthalate (BCF-I), and 9.9-bis (3.5-dimethyl-4-hydroxy phenyl) fluorene isophthalate (BDMPFI). Dissert. Abstr.

GAS-SOLID CHROMATOGRAPHY ON CATION FORMS OF LIGHTLY SULFONATED POROUS POLYMERS Ph.D. Thesis
Robert John Gaydosh 1981 266 p
Avail: Univ. Microfilms Order No. 8122397

Porapak Q, an ethyl vinyl benzene - divinyl benzene copolymer resin, lightly sulfonated and converted to various cationic forms for use as a packing in gas-solid chromatography (GC). These packings are an improvement over regular ion exchange resins for GC work. These resins are easily prepared, are stable at high temperatures, and the various metal forms of the resins offer a variety of diversified packings. The sulfonic acid content of the resin is closely controlled and with it, the amount of metal exchanged onto the resin. The stability of the silver form of the resin is particularly advantageous because this metal's strong affinity for unsaturated centers is utillized to separate these type compounds, and to study the physical interactions between the two. Dissert. Abstr.

N82-13238 North Carolina State Univ. at Raleigh.
EFFECT OF SOLVENTS ON THE RADIATION-INDUCED POLYMERIZATION OF ETHYL AND ISOPROPYL VINYL ETHERS Ph.D. Thesis
Wen-Chyi Hsieh 1981 112 p
Avail: Univ. Microfilms Order No. 8121731

The effect of solvents on the radiation-induced cationic polymerization of ethyl and isopropyl vinyl ethers (EVE and IPVE, respectively) was investigated. EVE and IPVE polymerizations were carried out in bulk and in solution under superdry conditions in which polar impurities, especially water, were reduced to negligible levels. Plots of the monomer conversions and irradiation times were obtained for EVE and IPVE polymerizations in bulk and in benzene solution at constant monomer concentrations. The results show that solvation of the propagating cation by the monomer molecules is insignificant. The monomer concentration dependence of the polymerization rate was studied for EVE polymerization in bulk and in benzene, diethyl ether, diglyme and methylene chloride, and for IPVE polymerization in bulk and in benzene. Solvent effect on the estimated propagating rate constants was examined for EVE and IPVE polymerization in bulk and in solution. The Laidler-Eyring theory, through evaluation of electrostatic forces of reaction media, could better predict the effect of polar solvents in IPVE polymerization than in EVE polymerization. The effect of temperature on the polymerization rate was also investigated. Dissert. Abstr.

STRAIN-INDUCED CRYSTALLIZATION OF POLYMERS Ph.D. Thesis
Kuo-Zong Hong 1981 282 p
Avail: Univ. Microfilms Order No. 8122777

A nucleation theory was formulated to account for the behavior of polymer crystallization under molecular strain or orientation. The enhancement of nucleation rate, the elevation of melting temperature, and the decrease in critical nucleus size were quantitatively predicted as a function of molecular strain. Crystalline kinetics, melting behavior, and morphology were experimentally determined and the interrelationships were explored. Effects of shear rate, crystallization temperature, molecular weight, and chemical structure were investigated. It was found that the nucleation rate, in terms of the reciprocal of induction time, increases with shear rate and decreases with temperature. The findings in kinetics, melting behavior, and morphology are consistent with each other in terms of the proposed theory, indicating that they all stem from the same origin: molecular strain, and thus entropy reduction.

STRUCTURE-PROPERTY RELATIONSHIPS IN SEGMENTED ELASTOMERS: SMALL ANGLE X-RAY SCATTERING, THERMAL, AND MECHANICAL STUDIES Ph.D. Thesis
John William Chapman VanBogart 1981 566 p
Avail: Univ. Microfilms Order No. 8117545

The structure-property relationships of a series of polyether and polyester polyurethanes and polyether-polyester segmented copolymers were studied as a function of hard-segment type, soft-segment type, segment length, hard-segment content, segment length polydispersity, and material thermal history. The model presented for the morphology of the semi-crystalline polyurethane materials suggests cylindrical or parallelipiped-shaped hard-segment crystallies with low axial ratios. The model for the H12 MDI-based polyurethanes involves spherical regions of amorphous hard-segments. Polyether polyurethanes were shown to have more complete phase separation than equivalent polyester-based polyurethanes. Annealing was shown to improve the degree of phase separation in more compatible systems of segmented polyurethane elastomers. Hard-segment domain size and interfacial thickness were roughly twice as large the direction of stretch than transverse to it in semicrystalline materials. In genera, annealing resulted in an endothermic peak at a temperature 20 deg to 50 deg above that of the temperature of annealing in both semicrystalline and amorphous materials. Dissert. Abstr.

A STUDY OF THE DYNAMIC AND TRANSIENT PROPERTIES OF POLYMER SOLUTIONS Ph.D. Thesis
Christine Mary Jarzebski Vrentas 1981 211 p
Avail: Univ. Microfilms Order No. 8125028

A rheometrics mechanical spectrometer was used to study the dynamic and transient properties of polymer solutions. Dynamic moduli were measured using both a parallel plate oscillatory experiment and a stead state experiment conducted with an eccentric rotating disk (ERD) apparatus. Shear stress and normal stress relaxation data on polymer solutions were obtained with a cone and plate step shear strain experiment. These data were used to test nonlinear phenomenological and molecular constitutive theories. These experiments were conducted primarily linear and branched polybutadienes and their solutions. A computerized oscillatory experiment was developed to produce dynamic data against which ERD results could be compared. A computerized stress relaxation experiment was developed to produce reliable shear stress and normal stress relaxation data. The applicability of simple fluid theory to the rheology of polymer solutions was confirmed.

ELECTROSTATIC AND HYDRODYNAMIC INTERACTIONS OF CHARGED MACROMOLECULAR SYSTEMS Ph.D. Thesis
David Michael Piatt 1981 271 p
Avail: Univ. Microfilms Order No. 8120325

A variety of light scattering techniques, elastic, quasielastic, and electrophoretic quasielastic is used to characterize charged macromeolecular systems. The use of these techniques to characterize several biological and synthetic macromolecules is described. These samples include amphoteric latex particles, bovine rod outer segment disk membranes, concentrated protein solutions, and DNA dependent RNA polymerase. An amphoteric latex system was prepared by a surfactant free emulsion polymerization of styrene, methacrylic acid, and beta-N,Ndiethy amino ethyl methacrylate. It is found that the radius varies from 101 to 124 nm as the pH is varied from 7 to either 3 or 11. A similar, but smaller, change is observed in the Stokes radius, as determined by quasielastic light scattering. Electrophoretic quasielastic light scattering shows that the change in the magnitude of the electrophotoretic mobility is symmetric about a pH slightly less than 7 (6.7-6.8). A simple concentric sphere model is presented which can qualitatively account for these changes.

BARRIERS TO THE UTILIZATION OF SYNTHETIC FUELS FOR TRANSPORTATION Final Report
Harry W. Parker and Matthew J. Reilly Oct. 1981 25 p
(NASA Order C-57307-D; Contract DE-AI01-81CS-50006)
(NASA-CR-165517; DOE/NASA-7307/1) Avail: NTIS HC A02/MF A01 CSCL 21D

The principal types of engines for transportation uses are reviewed and the specifications for conventional fuels are compared with specifications for synthetic fuels. Synfuel processes nearing the commercialization phase are reviewed. The barriers to using synfuels can be classified into four groups: technical, such as the uncertainty that a new engine design can satisfy the desired performance criteria; environmental, such as the risk that the engine emissions cannot meet the applicable environmental standards; economic, including the cost of using a synfuel relative to conventional transportation fuels; and market, involving market penetration by offering new engines, establishing new distribution systems and/or changing user expectations.

(Contract W-7405-eng-26)
(DE81-029095; ORNL/TM-7915) Avail: NTIS HC A02/MF A01

Rheological and density measurements have been made on the H-Coal PDU reactor effluent samples, which used Wyodak coal. Characterization was done in the ORNL Coal Liquids Flow System. Apparent viscosities and shear rates were observed. The rheological data were fitted to both power law and Bingham plastic models. The apparent viscosities appeared to correlate to the amount of solids in the samples.

Analytical data for narrow solvent refined coal (SRC 2) distillation cuts were compared and found to show similar trends. The precision of the basic nitrogen procedure was found to be within + or - 1% of the basic nitrogen content. A nuclear magnetic

resonance method for structural parameter characterization was implemented. An aromatic gas chromatograph (GC) standard was prepared for use in the simulated distillation by GC analyses. A GC column was used to show the sample changes which occur during pyrolysis. Exploratory experiments, carried out to determine the conditions of time and temperature under which the SRC 2 distillation cuts would pyrolyze, were conducted by vaporizing the SRC 2 cut, mixing the fuel vapor with helium, and then passing the mixture into the heated reaction zone. A set of analyses was obtained on the liquid products from pyrolysis at 800 C of 200 to 250 C SRC 2 distillation cut using two different residence times. Time and temperature exposure difficulties complicated data interpretation. Gas analyses showed the presence of hydrocarbon, HCN, NH3, and N2 in the gas phase.

LOW/MEDIUM BTU COAL GASIFICATION ASSESSMENT PROGRAM FOR POTENTIAL USERS IN NEW JERSEY: EXECUTIVE SUMMARY

May 1981 21 p refs
(Contract DE-AC01-79RA-20216)
(DE81-025475; DOE/FE-20216/1) Avail: NTIS HC A02/MF A01

The production of medium Btu quality gas (MBG) for use as fuel for on-site power plant boilers or for distribution to industrial customers appeared to be economically attractive, dependent upon the proximity of sufficient numbers of industrial customers and upon high plant utilization. The Texaco Coal Gasification Process (TCGP) was selected, being a pressurized process capable of supplying the gas without downstream compression. The TCGP could handle the high sulfur eastern coals chosen as a feedstock. All equipment downstream of the gasifier was commercially proven. The integration of the gasification process with a methanol synthesis plant, consuming up to 25% of the MBG produced, was desirable in order to allow storage of MBG during low demand and thereby increase the gasifier capacity factor and minimize its turndown requirements.

LOW-BTU GASIFICATION OF COAL FOR ELECTRIC POWER GENERATION, PHASE 1, 2, AND 3 Monthly Progress Report, 1 Apr. - 30 Apr. 1981

16 Aug. 1981 46 p refs
(Contract DE-AC01-76ET-10204)
(DE81-029482; DOE/ET-10204/T1; FE-1545-89) Avail: NTIS HC A03/MF A01

Oxygen-enriched operation of the Pressure Distribution Unit was initiated on April 1, 1981. Eleven oxygen enriched gasmaking tests were made during the month. These tests were interrupted upon eight occasions by slag tap pluggage or imminent pluggage. A 15 to 20 day opuations text was begun during the month, but not successfully completed owing to the tap hole pluaggage problems. Iron reduced from the slag due to the low oxygen concentration in this region was the most obvious explanation for the tap hole pluggages.

REVIEW OF LOW-VOLTAGE CP DETONATORS

M. L. Lieberman, F. J. Villa, D. L. Marchi, A. L. Lause, D. Yates, and J. W. Fronabarger 1981 25 p refs Presented at the 11th Symp. on Explosives and Pyrotechn., Philadelphia, 15 Sep. 1981 Prepared jointly with Unidynamics/Phoenix, Inc.
(Contract DE-AC04-76DP-00789)
(DE81-025837; SAND-81-0245C; CONF-810926-1) Avail: NTIS HC A02/MF A01

The compound 2-(5-cyano tetrazolato) penta ammine cobalt(III) perchlorate (CP) was developed to provide a relatively safe explosive material for low-voltage, hot-wire detonators. The design and development of CP detonators, and data on their performance are presented. Explosive CP was incorporated into a variety of low voltage deflagration-to-detonation transition (DDT) type detonators designed to have high density powder in the ignition region and low density powder in the DDT region. Devices were developed which meet 1 amp/1 watt no-fire and 3.5 amp all-fire requirements with high reliability. Detonation is achieved with high reliability at distances from the bridgewire of < 1/4 inch. Specific detonators were fabricated that are small and capable of withstanding high shock loads, long-term temperature extremes, and short-term high-temperature excursions.

PERFORMANCE OF CHEMICAL ANALOGS OF THE EXPLOSIVE CP

J. W. Fronabarger, W. Fleming, and M. L. Lieberman 1981 31 p refs Prepared jointly with Unidynamics/Phoenix
(Contract DE-AC04-76DP-00789)
(DE81-025836; SAND-81-0246C; CONF-810926-2) Avail: NTIS HC A03/MF A01

The development and weapons systems application of 2-(5-cyano tetrazolato) penta ammine cobalt (III) perchlorate, designated CP, for low voltage detonators, was studied to arrive at materials superior to CP in performance and sensitivity characteristics. Desired improvements included shorter deflagration-to-detonation transition (DDT) distances and lower electrostatic discharge (ESD) sensitivity in the confined, pressed state. Synthesis, analytical, and explosive testing activities, using 12 materials are presented. Several substituted (CP and CP analogs) undergo DDT directly from hot wire ignition. Some of the CP analogs exhibit DDT tendencies equivalent or superior to CP. The degree of DDT for the analogs is inversely proportional to density; none of the analogs studied were ESD sensitive, however, for the confined pressed form, the materials were ignitable from ESD. Many analogs showed lower ESD sensitivity than CP which suggests that safer detonators can be developed. Thermal response characteristics of the analogs varied somewhat, with exothermic activities.

FEASIBILITY STUDY REPORT FOR THE IMPERIAL VALLEY ETHANOL REFINERY: A 14.9-MILLION-GALLON-PER-YEAR ETHANOL SYNFUEL REFINERY UTILIZING GEOTHERMAL ENERGY

Mar. 1981 202 p Prepared in cooperation with U.S. Alcohol Fuels, East Mesa, Calif.
(Contract DE-FG07-80RA-50308; Proj. 1013)
(DE82-000288; DOE/RA-50308/1) Avail: NTIS HC A10/MF A01

The construction and operation of a 14,980,000 gallon per year fuel ethanol from grain refinery is proposed. The refinery will use hot geothermal fluid from geothermal resources as the source of process energy. In order to evaluate the economic viability of the proposed project, exhaustive engineering, cost analysis, and financial studies were undertaken. The results of feasibility studies undertaken in geothermal resource, engineering, marketing financing, management, environment, and permits and approvals are presented. The project was found to be economically viable.

The migration of deterrents into nitrocellulose grains is studied by means of the carbon 14 radiotracer technique. Such deterrents improve the internal ballistic properties of propellants and influence barrel erosion. The distribution of the deterrent compounds was measured by profile sectioning in conjunction with beta scintillation metering. The measurements yield values for diffusion coefficients, activation energies, and frequency factors as well as for scaling laws of the migration behavior with respect to temperature, time and concentration. A model of the migration mechanism, assuming a moving boundary, is established consistent with the available data

Anders Schwartz May 1981 51 p refs In SWEDISH; ENGLISH summary
(FOA-C-20411-D1) Avail NTIS HC A04/MF A01

The propellants tested are 85 months old. Properties were compared with properties from the first test on 32 months old propellants. Chemical stability is good. Tensile tests show small changes at low temperatures and high strain rates. The propellants possibly become a little stiffer. The adhesion of the inhibitor decreases considerably, especially the adhesion to propellant D23 where a decrease of about 43% was measured. The adhesion to propellant D28 decreases about 17%. Hardness and burning rate are not altered.

(PB81-234239; EPA-600/7-81-133) Avail: NTIS HC A16/MF A01 CSCL 21D

Biomass and coal conversion into clean energy is compared on an economic and environmental basis in three regional scenarios: (1) electric power from direct combustion of wood versus conventional coal combustion; (2) synthetic pipeline gas from anaerobic digestion of wheat straw and manure versus high-Btu gasification of coal (HYGAS); and (3) synthetic fuel oil from wood liquefaction versus coal liquefaction (H-Coal). Conceptual commercial-scale plants are described. Capital and operating costs are presented for each of the six plants, and the biomass versus coal economics are compared. General environmental impacts of biomass and coal resource collection are assessed and compared in the scenario contexts. GRA

EFFECTIVE STRESS-STRAIN-STRENGTH BEHAVIOR OF SILICATE-GROUTED SAND Ph.D. Thesis
Mohamed Adel Benltayf 1981 257 p
Avail: Univ. Microfilms Order No. 8124852

The effective stress concept was used to interpret the results of drained and undrained triaxial compression tests on grouted sand specimens which were grouted under at-rest conditions or under a confining stress. The behavior of grouted and ungrouted sand in drained and undrained shear was documented in terms of stress-strain, volume change, pore pressure, shearing resistance, and shear strength characteristics. The behavior of grouted sand in unconfined compression was analyzed. Specimens tested in triaxial compression after curing for six or more days exhibit no appreciable differences in stress-strain, volume change, pore pressure, and shear strength behavior. Grouting improves the stiffness and strength of ungrouted sand. The shearing resistance of silicate grouted sand is generated by cohesion and friction components which vary as a function of axial strain. The strength of grouted sand is greatly affected by drainage conditions and pore pressures.

MICROMECHANICS OF EXPANSIVE MECHANISMS IN EXPANSIVE CEMENT CONCRETES Ph.D. Thesis
Menashi David Cohen 1981 219 p
Avail: Univ. Microfilms Order No. 8124049

The kinetics of hydration were studied by monitoring the presence of various compounds by X-ray diffractometer, a chemical extraction method, and scanning electron microscope. These studies indicated that the rates of depletion of the expanding particles and sulfates are higher in the finer blends, which is why expansion stops earlier in these blends. It is shown that the double curvature phenomenon (strength-drop and sudden increase in the rate of expansion) is caused by mechanical failure (e.g., microcracking) of the matrix surrounding the expanding particles that are producing ettringite crystals. The theory of protective and partial protective coating is reviewed. A hypothesis is introduced which assumes that monosulfate is not formed immediately when ettringite stops forming but is preceded by an intermediate phase. Shrinkage studies show that expansive cements shrink more than portland cements. The results of these studies were used to develop a modified model of the expansive process. It was shown theoretically that the time of expansion is inversely proportional to the surface area of the expansive clinker and directly proportional to the amount of sulfate used.

RAPID CYCLE CASTING OF STEEL Final Report, 1 Jul. 1977 - 31 Aug. 1980
Diran Apelian and G. Langford Jul. 1981 533 p refs
(Contract DAAG29-77-C-0028; ARPA Order 3397)
(AD-A103567) Avail: NTIS HC A23/MF A01 CSCL 13/8

A rapid cycle casting process for steel via diffusion solidification (SD) is developed. Solidification takes place by carbon redistribution between iron saturated high carbon liquid iron and low carbon preexisting solid iron in a refractory mold. The solidification time is shorter and the economic scaling law is less dependent on the size of the casting than in conventional casting processes. The metallurgical and processing aspects of SD casting are addressed and the necessary parameters are developed to design a rapid cycle casting machine. These process parameters in addition to the metallurgical quality variables are included in an economic feasibility analysis of the SD process. GRA

PRELIMINARY EVALUATION OF ION IMPLANTATION AS A SURFACE TREATMENT TO REDUCE WEAR OF TOOL BITS Interim Report
F. A. Smidt, J. K. Hirvonen (Georgia Inst. of Technology, Atlanta), and S. Ramalingam 25 Sep. 1981 57 p refs
(RR0221141)
(AD-A105053; NRL-MR-4616) Avail: NTIS HC A04/MF A01 CSCL 13/8

The process of ion implantation is reviewed and concepts for use as a surface hardening technique for extending the life of machine tools are explored. It is concluded that for high speed steel tool materials a system based on implantation of Ti ions with subsequent reaction to form TiC in the surface layers should have merit. Exploratory tests showed that in machining tests of 4140 steel, an implanted M2 lathe tool bit required about 10 percent less power and has a wear rate approximately one half that of the unimplanted tool. Tests of end mills proved inconclusive because the optimum Ti level for the implant was not reached. Author

ULTIMATE IN BUILDING ENERGY ANALYSIS: DOE-2 AND BLAST
B. D. Hunn 1981 33 p refs Presented at the Symp. Energy and Big Building Design, Philadelphia, 25-26 May 1981 Submitted for publication
(Contract W-7405-eng-36)
(DE81-028703; LA-UR-81-2288; CONF-8105107-1) Avail: NTIS HC A03/MF A01

The DOE-2 and BLAST computer programs are investigated in terms of their usefulness in building energy analysis. DOE-2 and BLAST are generally classed as high-level, computer-dynamic methods that are based on hour-by-hour computation. The characteristics of DOE-2 and BLAST are discussed with emphasis on their solar simulation features, and their capabilities are contrasted and related. Typical applications of the programs to the retrofit of existing buildings and the design of new buildings, are presented. The passive solar retrofit of an office building, the use of DOE-2 as a predesign analysis tool, and the use of BLAST in a research and development application are all described. Future directions in research and development needs for high level building energy analysis tools and the progress being made toward increased use of these tools are discussed. DOE

APPLIANCE EFFICIENCY AND THE SOLAR BUILDING
Joel Swisher Jun. 1981 30 p refs
(Contracts EG-77-C-01-4042; DE-AC02-77CH-00178)
(DE81-029073; SERI/TR-721-1119) Avail: NTIS HC A03/MF A01

Energy use in residential appliances is examined. Current appliance energy use was evaluated and technologically feasible improvements were studied. A typical set of household appliances was developed, and modified by three classes of efficiency improvements. Significant energy saving potential was found in all major appliance energy uses, with the largest savings in water heaters and refrigerators. Costs of the improvements are relatively low, providing short payback times. The effects of the improvements on building thermal loads and electricity demand profiles were also examined. DOE

EVALUATION OF REEF SHELL EMBANKMENT Final Report, Aug. 1976 - Dec. 1980
James L. Melancon and Steve G. Bokun Dec. 1980 75 p refs Sponsored in part by DOT
(PB81-232761; LA-77-1S-B; FHWA/LA-81/129) Avail: NTIS HC A04/MF A01 CSCL 13B

A method of constructing an embankment over marshland soils by end-dumping reef shell directly onto the marshland with no other major subgrade preparation is discussed. The dumped reef shell is then spread out to form a 'floating' embankment over the soft marshland. The subsidence characteristics of a reef shell embankment are compared with those of a clam shell embankment to determine if such a reef shell embankment would provide adequate structural support for traffic. Results show it is physically and economically feasible to construct a reef shell embankment on soft organic marshland soils. A properly constructed reef shell embankment develops into a homogeneous floating slab of substantial stability and strength capable of supporting allowable traffic loads. GRA

CONSTRUCTION OF A RECYCLED PORTLAND CEMENT CONCRETE PAVEMENT Construction Report, Oct. 1979 - May 1980
Keith R. Lane Sep. 1980 43 p refs
(HPR Proj. 646)
(PB81-233553; FHWA/CT-80/12; Rept-646-1-80-12) Avail: NTIS HC A03/MF A01 CSCL 13B

Connecticut's first experience with Portland cement concrete recycling is described. The test location was on I-84 in Waterbury, a major expressway which required extensive realignment and widening. The primary concern was to obtain the technical expertise to design and place a recycled pavement. Secondary factors also investigated were the analysis of environmental, economic and energy factors relative to the option of recycling or new construction of a portland cement concrete pavement. GRA

THE EFFECTS OF ADDED SOFTENING AGENTS UPON THE BEHAVIOR OF COLD RECYCLED ASPHALT MIXTURES

Akio Lida 1 Oct. 1980 471 p refs
(PB81-231417; JHRP-80-13; FHWA/IN/JHRP-80/13) Avail: NTIS HC A20/MF A01 CSCL 13C

The long-term behavior of recycled mixtures, especially when the recycling is done cold is reported. The long-term properties of laboratory specimens prepared with different softening agents were evaluated by means of a creep test. A design procedure for cold recycled mixtures is proposed which recommends that blending curves be developed and that a creep test be used to determine mixture properties over a period of time. GRA

A LABORATORY EVALUATION OF MODIFIED ASPHALT Final Report, Nov. 1979 - Nov. 1980

Donald E. Carey and Harold R. Paul Jan. 1981 53 p Sponsored by the Federal Highway Administration, Washington, D.C.
(PB81-231615; LA-80-1B-B; FHWA/LA-81/142) Avail: NTIS HC A04/MF A01 CSCL 13C

The structural properties of sand mixes incorporating Chem-Crete binder compare favorably with densegraded asphaltic concrete. This binder, processed according to a new refinery technique, is purported to improve asphalt properties such as strength, durability, temperature susceptibility and water resistance. These attributes and other properties of sand/Chem-Crete mixes are examined. Generally, upon curing, sand mixes utilizing Chem-Crete binder demonstrate properties equal to or superior to Louisiana's dense-graded Type 1 asphaltic concrete (1200-lb. stability). GRA

PILOT-SCALE DEVELOPMENT OF A LOW-NOX COAL-FIRED TANGENTIAL SYSTEM Final Report, Sep. 1978 - Feb. 1981

J. T. Kelly, R. A. Brown, E. K. Chu, J. B. Wightman, R. L. Pam, E. L. Swenson, E. B. Merrick, and C. F. Busch Aug. 1981 239 p refs
(Contract EPA-68-02-1885)
(PB81-242513; EPA-600/7-81-137; IERL-RTP-1233) Avail: NTIS HC A11/MF A01 CSCL 13A

A 293 kWt (1 million Btu/hr) pilot scale facility is used to develop a low NOx pulverized coal fired tangential system. A burner concept is developed which achieves low NOx by directing the fuel and a fraction of the secondary combustion air into the center of the furnace, with the remaining secondary combustion air directed horizontally and parallel to the furnance walls. Such separation of secondary combustion air creates a fuel rich zone in the center of the furnace where NOx production is minimized. This combustion modification technique lowers NOx 64%, relative to conventional tangential firing, by injecting 85% of the secondary air along the furnace walls. Under these conditions, NO emissions are 180 ppm corrected to 0% O2. Also at these conditions, CO, UHC, and unburned carbon emissions are less than 40 ppm, 3 ppm, and 2.4%, respectively, comparable to conventional tangentially fired pilot scale results. GRA

OPTIMUM DESIGN OF STATIC, EARTHQUAKE, AND WIND STEEL STRUCTURES (ODSEWS-2D)

Franklin Y. Cheng, D. Srifuengfung, and L. H. Sheng Jan. 1981 314 p refs
(Grant NSF PFR-78-05694)
(PB81-232738; CIVIL-ENGINEERING-STUDY-81-10) Avail: NTIS HC A14/MF A01 CSCL 13M

A design technique is presented for trusses and braced and unbraced frames with consideration of various constraints of stresses, displacements, natural frequencies, member sizes, and upper- and lower-bounds of member stiffnesses. A computer program ODSEWS (Optimum Design of Static, Earthquake, and Wind Structures) was developed for which the dynamic input may be response spectra or code provisions. More than 80 cases were designed in which the frames were varied from one story to 30 stories for examining various response parameters. Among them the particular interests are in the effect of the interacting ground motions including P-Delta on the stiffness distribution at critical regions and at the entire system as well as in the assessment of structural systems and their serviceability. REVIEW OF FIRE TEST METHODS AND INCIDENT DATA FOR PORTABLE ELECTRIC CABLES IN UNDERGROUND COAL MINES Final Report

Emil Braun Jun. 1981 23 p refs
(PB81-227876; NBSIR-81-2292) Avail: NTIS HC A02/MF A01 CSCL 13L

Electrically powered underground coal mining machinery is connected to a load center or distribution box by electric cables. The connecting cables used on mobile machines are required to meet fire performance requirements defined in the Code of Federal Regulations. This report reviews Mine Safety and Health Administration's (MSHA) current test method and compares it to British practices. Incident data for fires caused by trailing cable failures and splice failures were also reviewed. It was found that the MSHA test method is more severe than the British but that neither evaluated grouped cable fire performance. The incident data indicated that the grouped configuration of cables on a reel accounted for a majority of the fires since 1970. GRA

THE ROLE OF FATIGUE TESTING c39

P. R. Edwards *In* AGARD Fatigue Test Methodology Oct. 1981 15 p refs (For primary document see N82-13274 04-31)
Avail: NTIS HC A12/MF A01

Fatigue testing which involves proving and developing components, materials and processes, investigating particularly factors such as corrosion which can be damaging and those such as fatigue resistant fasteners which are beneficial to fatigue is discussed. Modern electrohydraulic machines and computers allow application of more representative loading conditions, tests to be monitored, and efficient data analyses. Use of standard loading sequences offers considerable benefits to fatigue programs. The monitoring of fatigue damage through the life since these techniques are very different between metals and composites is emphasized. Metals test techniques which determine cyclic stresses and strains at points of fatigue initiation have led to considerable improvements in accuracy of life prediction. Author

N82-13276# Fraunhofer-Inst. fuer Betriebsfestigkeit, Darmstadt (West Germany).

PLANNING AND ANALYSIS OF A FATIGUE TEST PROGRAMME

c39

D. Schuetz *In* AGARD Fatigue Test Methodology Oct. 1981 22 p refs (For primary document see N82-13274 04-31)
Avail: NTIS HC A12/MF A01

Advances in fatigue testing methods are presented. The increasing amount of service load data, the use of fracture mechanics, and the application of prediction methods which emphasize local stresses and/or strains are discussed. It is suggested that fatigue tests are still imperative in determining the fatigue performance of components or built up structures. Fatigue tests are the most important part of a fatigue life evaluation in spite of the current level of knowledge of fatigue mechanisms. E.A.K.

FATIGUE TEST MACHINES

c39

H. Nowack *In* AGARD Fatigue Test Methodology Oct. 1981 23 p refs (For primary document see N82-13274 04-31)
Avail: NTIS HC A12/MF A01

Conventional and servohydraulic testing machines are reviewed. The main ranges in application of the systems are described. Servohydraulic resonance machines enable both, random tests and constant amplitude tests. For component and full scale tests of structures sophisticated test systems become necessary, which have to fulfill numerous specific requirements. The testing machines devices for the control, monitoring, and recording of the test parameters are described. It is concluded that online computers are a most efficient tool for the performance of fatigue tests. E.A.K.

N82-13278# Fraunhofer-Inst. fuer Betriebsfestigkeit, Darmstadt (West Germany).

VARIABLE AMPLITUDE FATIGUE TESTING

c39

D. Schuetz *In* AGARD Fatigue Test Methodology Oct. 1981 31 p refs (For primary document see N82-13274 04-31)
Avail: NTIS HC A12/MF A01

The blocked program tests made possible through the introduction of a testing machine with a hybrid loading system consisting of a resonant type frequency device for blocks of loads with many cycles, and a hydraulic device for load blocks with a small number of cycles and single load cycles with differing amplitudes are discussed. It is pointed out that it is the introduction of electroservohydraulic closed loop testing machines which marked the first real breakthrough. The machines allow a component to be loaded in any load sequence at relatively high frequencies. Advancements are also made in the field of servohydraulics. Machines on which complicated load sequences can be applied are used for a large variety of variable amplitude loading sequences. E.A.K.

N82-13279# Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Cologne (West Germany). Inst. fuer Werkstoff-Forschung.

ON-LINE COMPUTERS IN FATIGUE TESTING

c39

H. Nowack *In* AGARD Fatigue Test Methodology Oct. 1981 11 p refs (For primary document see N82-13274 04-31)
Avail: NTIS HC A12/MF A01

The introduction of online computer systems into fatigue testing are discussed. Different application schemes of computerized systems are described: dedicated systems, multiple purpose systems, and maximum flexibility systems. Essential viewpoints of the development of computerized systems are given. It is shown, that professional systems can offer significant advantages in many cases. Various aspects and examples for the practical work with computerized systems are given. E.A.K.

N82-13280# Bath Univ. (England). School of Materials Science.

FATIGUE TESTING OF FIBRE COMPOSITES

c24

Bryan Harris *In* AGARD Fatigue Test Methodology Oct. 1981 18 p refs (For primary document see N82-13274 04-31)
Avail: NTIS HC A12/MF A01

The progress of fatigue in composites was monitored by most of the usual methods: the determination of S/N curves and master diagrams using constant stress or strain amplitude or random fluctuations, the determination of residual strength, and the observation of crack growth rates. The interpretation of these results and their translation to the design process demand consideration of the mode of failure, the definition of failure used in any given instance, and the relevance of the test procedure to practical applications. E.A.K.

ELEVATED TEMPERATURE FATIGUE TESTING OF METALS

c26

Marvin H. Hirschberg *In* AGARD Fatigue Test Methodology Oct. 1981 18 p refs (For primary document see N82-13274 04-31)
Avail: NTIS HC A12/MF A01

Material characterization and evaluation conducted for the purpose of calculating fatigue crack initiation lives of components operating at elevated temperatures are discussed. The major technology areas needed to perform a life prediction of an aircraft turbine engine hot section component and the steps required for life prediction are outlined. These include: the determination of the operating environment, the calculation of the thermal and mechanical loading of the component, the cyclic stress strain and creep behavior of the material required for structural analysis, the structural analysis to determine the local stress strain temperature time response of the material at the critical location in the component, and from a knowledge of the fatigue, creep, and failure resistance of the material, a prediction of the life of the component. E.A.K.

N82-13282# Royal Aircraft Establishment, Farnborough (England). Materials Dept.

FATIGUE TESTS WITH A CORROSIVE ENVIRONMENT

c39

R. N. Wilson *In* AGARD Fatigue Test Methodology Oct. 1981 20 p refs (For primary document see N82-13274 04-31)
Avail: NTIS HC A12/MF A01

The techniques used to study the fatigue behavior of metals and alloys in vacuum, gas and liquid environments are outlined. The methods used to simulate service conditions in the laboratory are described and the variables which must be considered when planning a corrosion fatigue test programme are discussed. An attempt to control or eliminate some of the experimental variables is illustrated. The fatigue performance of a fully protected 1.5 dog bone aluminium alloy test piece which is prestressed at low temperature and exposed to a corrosive environment prior to fatigue testing in salt fog is evaluated. E.A.K.

METHODS OF OBTAINING CRACK GROWTH DATA IN METALS

c26

P. R. Edwards *In* AGARD Fatigue Test Methodology Oct. 1981 22 p refs (For primary document see N82-13274 04-31)
Avail: NTIS HC A12/MF A01

Methods of obtaining crack growth data in metals are subdivided into several groups. Crack length is determined by measuring compliance which changes as a crack grows. Compliance is measured across the faces of the crack with a clip gauge. Optical methods include surface crack length measurement techniques. With electrical methods a DC, pulsed DC or AC electric current is passed through the specimen and, across any crack, a potential drop is created indicating the crack size. Sonic methods include ultrasonics and acoustic emission, the former measuring crack length by interpreting reflected or transmitted ultrasonic beams and the latter obtaining an indication of crack rate by recording stress waves emitted as energy is released when the tip of the crack advances. Mechanical devices which fracture with the crack are used either as individual conductors bonded across the crack path or as a foil which changes in resistance as the crack grows through it. It is feasible to design specimens in which cracks occur in an area favorable for accurate or simple measurement. Fracture surface readback is the only method which offers the possibility of determining crack rates on a specimen retrospectively after failure. E.A.K.

N82-13284# Bath Univ. (England). School of Materials Science.

MONITORING OF DAMAGE IN FIBRE COMPOSITES c24

Bryan Harris *In* AGARD Fatigue Test Methodology Oct. 1981 23 p refs (For primary document see N82-13274 04-31)

Avail: NTIS HC A12/MF A01

Various techniques were used to study the accumulation of damage in composite subjected to fatigue. Optical methods, x-radiography, ultrasonic techniques, thermal imaging, and acoustic emission analysis are all methods which are capable of revealing certain aspects of the development of damaged regions in a composite, but the usefulness of most of these is limited to certain types of material or specific structural situations. E.A.K.

CYCLIC STRAIN APPROACH TO FATIGUE IN METALS c26

T. H. Topper and P. Au *In* AGARD Fatigue Test Methodology Oct. 1981 25 p refs (For primary document see N82-13274 04-31)

Avail: NTIS HC A12/MF A01

The progress of a crack from its initiation in a notch root through the notch stress field was simulated based on local notch root strains. Strains at the notch root or at the tip of the advancing crack are simulated or calculated and used to describe crack growth. These approaches are mainly applicable to blunt notches in which threshold stress continuously increases with crack length, while fracture mechanics approaches are adequate for sharp notches in which the maximum threshold stress occurs inside the material rather than at the surface. Methods of simulating cyclic plastic notch strains and the resulting crack advance and methods of simulating the effect of variable amplitude loading and biaxial stress states are described. E.A.K.

N82-13286 Duke Univ., Durham, N. C.

ANALYSIS AND BEHAVIOR OF STRUCTURES ON DISCRETE TENSIONLESS FOUNDATIONS Ph.D. Thesis

Mustafa Yousif Al-Mandil 1981 161 p

Avail: Univ. Microfilms Order No. 8124797

The behavior of a discrete tensionless foundation system is analyzed. Subsequently, seven general theorems regarding the nature of this class of problems are proven. Thirteen pure and mixed strategy algorithms are reviewed and their application to a typical illustrative problem is studied. Nonlinear boundary properties which give rise to multiple solutions are modelled, and a new algorithm is presented. The reliability of this algorithm in obtaining a second equilibrium configuration is discussed. The governing equations for the conventional foundations problem have a unique solution. Modifying the Newton-Raphson algorithm, adding adaptive updating, load stopping, and extrapolation leads to an excellent equation solving algorithm. When more than one solution exists, the reliability of the deflation technique for educing an alternate root for the system is improved by use of a new adaptive under-relaxation of a Newton-Raphson process. Dissert. Abstr.

N82-13287 Northwestern Univ., Evanston, Ill.

INJECTION AND DISTRIBUTION OF SILICATE GROUT IN SAND Ph.D. Thesis

Talat Abdul-Aziz Bader 1981 191 p

Avail: Univ. Microfilms Order No. 8124848

A laboratory model study to relate the effects of grout composition, silicate concentration, dilution, viscosity, temperature, and mechanical agitation to the actual pumping of the grout into the soil mass is described. Three experimental models, each with a different geometry, were studied: the basic difference between these models is the rate at which the grout front advances as the grout is injected at a constant flow rate. The magnitude and distribution of the pore fluid pressures developed during the grout injection process were measured, and the results indicate a very rapid decrease in pore fluid pressure with distance from the injection point. The strength and modulus of the grouted soil mass showed a tendency to decrease with distance from the injection point. Upon injection, the grout appears to flow progressively into the soil, with the fresher grout displacing the older grout toward the exterior of the grounded mass. There was no conclusive evidence of soil fracturing due to grout gelation in any of the tests. Dissert. Abstr.

N82-13288 Ohio State Univ., Columbus.

GEOMETRIC PROGRAMMING FOR ENGINEERING DESIGN OPTIMIZATION Ph.D. Thesis

Guri Singh Brar 1981 271 p

Avail: Univ. Microfilms Order No. 8121770

A computer program with the capabilities to handle generalized polynomial optimization problems was developed. Geometric programming theory for posynomial problems is used as the basis for this work. Signomial problems are converted to posynomial form through condensation. In the preparation of the program, features are built-in such that the user can control output by specifying input variables. An example is included to illustrate the step-by-step procedure for the use of this program. Several civil engineering optimization problems are formulated and solved using the algorithm GPALL. Practical suggestions are made to reduce the large size problems to a manageable size for an efficient solution. Convergence of the algorithm and its drawbacks are discussed. Dissert. Abstr.

A DIGITAL TV SYSTEM FOR THE DETECTION OF HIGH SPEED HUMAN MOTION Ph.D. Thesis

Rong Chin Fang 1981 298 p

Avail: Univ. Microfilms Order No. 8121787

Two array cameras and a force plate were linked to a PDP-11/34 minicomputer for an on-line recording of high speed human motion. A microprocessor-based interface system was constructed to allow preprocessing and coordinating of the video data before being transferred to the minicomputer. Control programs of the interface system are stored in the disk and loaded into the program storage areas of the microprocessor before the interface system starts its operation. Software programs for collecting and processing video and force data have been written. Experiments on the detection of human jumping have been carried out. Normal gait and amputee gait have also been recorded and analyzed. Dissert. Abstr.

N82-13290 Purdue Univ., Lafayette, Ind.

DIGITAL VIDEO BANDWIDTH COMPRESSION SYSTEMS EMPLOYING BLOCK TRUNCATION CODING Ph.D. Thesis

Donald Joseph Healy 1981 134 p

Avail: Univ. Microfilms Order No. 8123650

A technique for bandwidth compression coding of sequential digitized video imagery is presented. The method uses adaptive one bit quantization over small blocks of space and time. The system includes global registration and motion detection for optimal bit assignments. A comparison is made with a conditional replenishment technique using a motion compensated predictor described in the literature. The method presented produces reconstructed video sequences filmed from low altitude aircraft with negligible degradation at 0.9 bit per pixel data rate. Robust behavior in the presence of channel noise is demonstrated. Dissert. Abstr.

N82-13291 Ohio State Univ., Cleveland.

HIGH FREQUENCY SCATTERING FROM MULTIPLE FINITE ELLIPTIC CYLINDERS Ph.D. Thesis

Eric Dale Greer 1981 196 p

Avail: Univ. Microfilms Order No. 8121795

The near and far zone radiation patterns of high frequency antennas in the presence of one or more finite length perfectly conducting elliptic cylinders was analyzed. The finite length perfectly conducting elliptic cylinder can be used to model many curved surfaces found in shipboard, aircraft, and other complex electromagnetic environments. The near zone portion of this solution is useful for analyzing the coupling between antennas and for calculating radiation hazards in addition to verifying near field pattern measurements. The scattered fields of one or more elliptic cylinders are analyzed using the uniform geometrical theory of diffraction. The validity of this solution is shown by comparing the results with an exact modal solution, moment method solutions, and measured results. The examples studied indicate that this analysis will provide a useful solution within engineering accuracy to problems of practical interest to antenna designers. Dissert. Abstr.

N82-13292 Arizona State Univ., Tempe.
TWO-PATH MODEL OF FADING IN A HIGH DATA RATE COMMUNICATION CHANNEL Ph.D. Thesis
Pou-Tou Sun 1981 113 p
Avail: Univ. Microfilms Order No. 8124498

In order to simulate the properties of channel fading in high data rate communications, two new techniques have been devised to develop two new fading channel models. One method is a nondispersed fading channel model and the other is a dispersed fading channel model. The usefulness of these two models has been demonstrated and the effect of channel fading can be easily analyzed and understood at the input and output of the matched filter in the receiver. The difficulty in the simulation of channel fading, due to cross interference for Quadriphase-Shift Keying (QPSK) by the freqency domain analysis, is also solved by these models. The models have been applied to two commonly used communication systems, one being the Binary Phase-Shift Keying (BPSK) and the other being the Quadriphase-Shift Keying. The channel fading can be characterized and compared from the average probabilities of error of the system. The results show that the system performance of QPSK is more influenced by channel fading than BPSK. Dissert. Abstr.

N82-13293 Stanford Univ., Calif.
ENERGY SPECTRAL ANALYSIS IN PROJECTION RADIOGRAPHY Ph.D. Thesis
Bruno Strul 1981 97 p
Avail: Univ. Microfilms Order No. 8124163

Two topics related to the visualization of low contrast details in projection radiography are considered. The Compton scatter component in a given radiological study is quantitatively determined. Knowledge of the scatter fraction is important in the design of imaging systems and evaluation of their performance. A mathematical model for deriving the scatter fraction and the effectiveness of scatter reduction through separation of the object from the detector plane is presented. Experimental data are presented to substantiate the theoretical results. Second, a spatial frequency multiplexing method which enables recording of two images of an object, each at a different X-ray energy, on a single radiographic transparency is presented. This method is especially useful for K edge detection of low concentrations of iodinated contrast agents. Experimental results demonstrating the encoding and decoding techniques are presented. Dissert. Abstr.

(Contract NAS7-100)
(NASA-CR-165020; JPL-Pub-81-73) Avail: NTIS HC A06/MF A01 CSCL 17B

Basic characteristics of digital data transmission systems described include the physical communication links, the notion of bandwidth, FCC regulations, and performance measurements such as bit rates, bit error probabilities, throughputs, and delays. The error probability performance and spectral characteristics of various modulation/demodulation techniques commonly used or proposed for use in radio and satellite communication links are summarized. Forward error correction with block or convolutional codes is also discussed along with the important coding parameter, channel cutoff rate. A.R.H.

THE 30/20 GHz COMMUNICATIONS SATELLITE TRUNKING NETWORK STUDY

William Kolb Oct. 1981 65 p
(Contract NAS3-22496)
(NASA-CR-165467) Avail: NTIS HC A04/MF A01 CSCL 17B

Alternative transmission media for a CONUS-wide trunking network in the years 1990 and 2000 are examined. The alternative technologies comprised fiber optic cable, conventional C- and Ku-band satellites, and 30/20 GHz satellites. Three levels of implementation were considered - a 10-city network, a 20-city network, and a 40-city network. The cities selected were the major metropolitan areas with the greatest communications demand. All intercity voice, data, and video traffic carried more than 40 miles was included in the analysis. In the optimized network, traffic transmitted less than 500 miles was found to be better served by fiber optic cable in 1990. By the year 2000, the crossover point would be down to 200 miles, assuming availability of 30/20 GHz satellites. Author

FIBER OPTICS (OPTICAL WAVEGUIDES) TECHNOLOGY: POTENTIAL APPLICATION IN THE DCS

Harris A. Stover Feb. 1981 51 p
(AD-A104740; DCEC-TN-9-81) Avail: NTIS HC A04/MF A01 CSCL 17/2

This report is intended to introduce the reader to this new technology in sufficient detail to permit meaningful and reasonable consideration of potential applications in the DCS. Historical background is provided along with a brief discussion of the fundamental physics involved. A summary of the state-of-the-art in fiber optics cables is provided, which when considered along with related discussions of cable losses, light sources, light detectors, splices, connectors, and commercial applications of fiber optics should give the reader a good understanding of the present state of the fiber optics technology. A section is given on the properties of fiber optics that make them attractive for military communications. It will provide insight into functional and technical advantages of applying the technology in the DCS in addition to economic advantages of some applications. A brief section discusses current military fiber optics systems applicable to the DCS. The section on survivability of fiber optics communications introduces and discusses survivability of fiber optics communications, and indicates many possibilities where fiber optics might significantly enhance the survivability of the DCS. ANTENNA (SELECTED ARTICLES)

13 Oct. 1981 31 p refs Transl. into ENGLISH from Antenny (USSR), no. 5, 1969 p 82-107
(AD-A106523; ; FTD-ID(RS)T-0960-81) Avail: NTIS HC A03/MF A01 CSCL 20/14

The radiation pattern of arc antennas in a plane orthogonal to the plane of an arc is formulated. The formula is dependent on the radius of the arc and amplitude distribution in the orthogonal plane. The efficiency and output coefficient of power, directive gain, and gain factor of a linear periodic array are investigated. For individual titles, see N82-13305 through N82-13306.

ENERGY CHARACTERISTICS OF PERIODIC SYSTEMS OF RADIATORS: EFFICIENCY AND OUTPUT COEFFICIENT OF POWER, DIRECTIVE GAIN, AND GAIN FACTOR

I. V. Guzeyev and A. B. Kolot *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0960-81) 13 Oct. 1981 p 14-27 refs Transl. into ENGLISH from Antenny (USSR), no. 5, 1969 (For primary document see N82-13304 04-32)
Avail: NTIS HC A03/MF A01 CSCL 20/14

The efficiency and output of power directive gain, and gain factor of a linear periodic array are investigated. The matrix of scattering and partial gain of the array element is established. S.L.

N82-13307# Joint Publications Research Service, Arlington, Va.

ANTENNA (SELECTED ARTICLES)

15 Oct. 1981 99 p refs Transl. into ENGLISH from Antenny (USSR), no. 7, 1979 p 1-50
(AD-B060598; FTD-ID(RS)T-0820-81; FTD-81-C-000943)
Avail: NTIS HC A05/MF A01 CSCL 20/14

Results of experimental studies on two-mirror antenna systems for radio relay communication are summarized. The system, having displaced focal axis and high electrical parameters, can also be applied to space communication. The following antenna system parameters are discussed: structural design criteria; system schematics; equipment specifications for the parabolic and horn antennas; economic considerations; mathematical methods for describing antenna radiation patterns and solving problems of discrete emitters in radiating systems; amplification, polarization, displacement, and reflection factors. For individual titles, see N82-13308 through N82-13310.

SOME PROPERTIES OF THE RADIATING APERTURE SUPERDIRECTIONALITY

L. A. Vengrovich *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0821-81) 15 Oct. 1981 p 1-27 refs Transl. into ENGLISH from Antenny (USSR), no. 5, 1969 p 20-34 (For primary document see N82-13311 04-32)

Avail: NTIS HC A08/MF A01 CSCL 20/14

Radiating aperture superdirectionality, to assess the physical limitations of radiation was studied. An integral equation which connects the excitable in the aperture electric field with the transverse component of the magnetic field is derived. Solution of the integral equation and introduction of equivalent outlines allows computation of the total power flux through the slot and the energy accumulated in its vicinity. E.A.K.

N82-13313# Air Force Systems Command, Wright-Patterson AFB, Ohio. Foreign Technology Div.

SOLUTION OF THE PROBLEM OF THE SYNTHESIS OF ANTENNAS WITH THE AID OF A COHERENT OPTICAL SYSTEM

L. D. Bakhrakh, Yu. A. Kolosov, A. P. Kurochkin, and V. I. Troitskiy *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0821-81) 15 Oct. 1981 p 28-56 refs Transl. into ENGLISH from Antenny (USSR), no. 5, 1969 p 47-60 (For primary document see N82-13311 04-32)

Avail: NTIS HC A08/MF A01 CSCL 20/14

The synthesis of plane aperture with the use of a coherent optical system was studied. Optical simulation methods of antennas in by synthesis and the special features/peculiarities of the recording of the transparencies which imitate the preset composite radiation patterns are examined. A diagram of optical installation for the synthesis of antennas with the plane aperture and the results of the synthesis of some radiation patterns is provided. E.A.K.

N82-13314# Air Force Systems Command, Wright-Patterson AFB, Ohio. Foreign Technology Div.

THIN MAGNETIC IMPEDANCE ANTENNAS

E. A. Glushkovskiy, B. M. Levin, and Ye. Ya. Rabinovich *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0821-81) 15 Oct. 1981 p 57-80 refs Transl. into ENGLISH from Antenny (USSR), no. 5, 1969 p 108-120 (For primary document see N82-13311 04-32)

Avail: NTIS HC A08/MF A01 CSCL 20/14

Application of impedance boundary conditions to the solution of excitation of thin magnetic radiators was investigated. The thin ferrite of the finite length, excited by the framework, and the narrow slot, gashed in the conducting cylinder is discussed. E.A.K.

N82-13315# Air Force Systems Command, Wright-Patterson AFB, Ohio. Foreign Technology Div.

OPEN RESONATORS, FORMED BY CONFOCAL MIRRORS WITH THE VARIABLE REFLECTION COEFFICIENT AND THE GENERALIZED HYPER-SPHEROIDAL FUNCTIONS

N. S. Kosmodamianskaya and V. F. Los *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0821-81) 15 Oct. 1981 p 81-111 refs Transl. into ENGLISH from Antenny (USSR), no. 5, 1969 p 121-139 (For primary document see N82-13311 04-32)

Avail: NTIS HC A08/MF A01 CSCL 20/14

The characteristics of a confocal resonator with rectangular and circular mirrors from which transparency is changed by the specific law were examined. It is shown that for the mirrors with the ideal reflection the problem is reduced to the examination of a differential equation in which the solution is expressed as the generalized hyperspheroidal function. The asymptotic representations of this function is obtained and the results of the calculations are given. E.A.K.

N82-13316# Air Force Systems Command, Wright-Patterson AFB, Ohio. Foreign Technology Div.

METHOD OF THE STUDY OF COMPLEX WAVEGUIDE JUNCTIONS WITH ONE OR SEVERAL REGIONS OF COMMUNICATION

S. V. Butakova *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0821-81) 15 Oct. 1981 p 112-142 refs Transl. into ENGLISH from Antenny (USSR), no. 5, 1969 p 140-154 (For primary document see N82-13311 04-32)

Avail: NTIS HC A08/MF A01 CSCL 20/14

Complex waveguide junctions with several regions of communication were studied. The formula of the scattering matrix of the connections of regular waveguides with the heterogeneities, which calculate different plumbings by using a computer is obtained. Formulas of the scattering matrices of several devices SVCH in rectangular waveguide with H sub MO waves are presented. E.A.K.

N82-13317# Air Force Systems Command, Wright-Patterson AFB, Ohio. Foreign Technology Div.

THREE-STAGE COMMUTATION FIELD OF THE SYSTEM OF THE REPEATED USE OF SHORT-WAVE RECEIVING ANTENNAS

V. D. Chelyshev *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0821-81) 15 Oct. 1981 p 143-160 refs Transl. into ENGLISH from Antenny (USSR), no. 5, 1969 p 154-162 (For primary document see N82-13311 04-32)

Avail: NTIS HC A08/MF A01 CSCL 20/14

Three stage commutation systems were examined. The special features which ensue from the admissibility of simultaneous connection to one antenna of the group of receivers are considered. The fundamental characteristics of three to stage commutation fields are given in the comparison with the single stage field of the same capacity. E.A.K.

THE DEVELOPMENT OF DOMESTIC TECHNOLOGY FOR TELEVISION TRANSMITTING ANTENNAS

D. M. Truskanov *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0937-81) 19 Oct. 1981 p 1-37 refs Transl. into ENGLISH from Antenny (USSR), no. 2, 1967 p 4-32 (For primary document see N82-13318 04-32)

Avail: NTIS HC A05/MF A01 CSCL 20/14

The history of the development of Russian technology for television transmission antennas and the current state of the art are reviewed. The principles of construction of antenna feed circuits are described. Multiprogram antenna systems mounted on masts 235 and 350 m high, a 316 m high tower antenna system in Leningrad, and the 533 m high Ostankino tower antenna in Moscow are described. J.D.H.

N82-13320# Air Force Systems Command, Wright-Patterson AFB, Ohio. Foreign Technology Div.

DISCRIMINATION OF HOLOGRAM AND ANTENNA THEORY

A. A. Pistolkors *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0937-81) 19 Oct. 1981 p 38-57 refs Transl. into ENGLISH for Antenny (USSR), no. 2, 1967 p 55-70 (For primary document see N82-13318 04-32)

Avail: NTIS HC A05/MF A01 CSCL 20/14

A theoretical examination of image discrimination of the hologram during image reproduction is presented. A two dimensional electrodynamic problem is examined. With the use of planar and cylindrical reference flows, conditions for the correct reproduction of the image of a luminous line are established. The discrimination of the hologram in the direction parallel to its plane is investigated. A similarity is noted between the obtained expression and the integral equation of a linear antenna, making possible utilization of the theory of the directional effect of antennas in determining the solution. It is shown that the maximum resolution in the plane parallel to the hologram is equal to the wave length. Discrimination in the direction perpendicular to the plane is much worse than in the parallel. J.D.H.

N82-13321# Air Force Systems Command, Wright-Patterson AFB, Ohio. Foreign Technology Div.

RADIATION OF AN ANTENNA IN THE FORM OF A RIBBED SHAFT OF FINITE LENGTH

G. D. Malushkov *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0937-81) 19 Oct. 1981 p 58-74 refs Transl. into ENGLISH from Antenny (USSR), no. 2, 1967 p 117-130 (For primary document see N82-13318 04-32)

Avail: NTIS HC A05/MF A01 CSCL 20/14

The method of integral equations of the first order is used to solve the problem of excitation of an impedance cylinder of finite length by a short symmetrical electrical dipole with sinusoidal distribution of the outside current. The dipole is located on the axis of rotation of the cylinder, and is perpendicular to it. Also given are the procedure and some results of calculation of the current distributions on the surface of the impedance cylinder, and the beam patterns for constant and variable (linearly-increasing) impedances. The calculated and experimental beam patterns are analyzed as a function of the length, the radius of the cylinder and the magnitude of the surface impedance. Author

N82-13322# Air Force Systems Command, Wright-Patterson AFB, Ohio. Foreign Technology Div.

POSSIBILITIES OF PHASE CORRECTION ON THE SMALL REFLECTOR IN A TWO-REFLECTOR ANTENNA

A. L. Ayzenberg *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0937-81) 19 Oct. 1981 p 75-91 refs Transl. into ENGLISH from Antenny (USSR), no. 2, 1967 p 166-178 (For primary document see N82-13318 04-32)

Avail: NTIS HC A05/MF A01 CSCL 20/14

The effect of redistribution of energy in a two-reflector system on the directive gain and noise temperature of the antenna is analyzed. Phase errors are compensated for by flexures of the basic (large) reflector, through automatic correction of the shape of the auxiliary (small) reflector. The calculations determine the maximum permissible deformations of the reflectors possible with given impairments of the antenna characteristics. J.D.H.

N82-13323# Air Force Systems Command, Wright-Patterson AFB, Ohio. Foreign Technology Div.

ANTENNA (SELECTED ARTICLES)

16 Oct. 1981 64 p refs Transl. into ENGLISH from Antenny (USSR), no. 9, 1970 p 53-80 (AD-A106499; FTD-ID(RS)T-0822-81) Avail: NTIS HC A04/MF A01 CSCL 20/14

Irregular quasi-optical lines (beam guides) are statistically analyzed using computerized simulation. The statistical theory of antennas is used to determine the statistical characteristics of the 'noise' of transparent dielectric films. Frequency dividers for metal dielectric waveguides with high electrical characteristics in the broadband are developed. For individual titles, see N82-13324 through N82-13326.

N82-13324# Air Force Systems Command, Wright-Patterson AFB, Ohio. Foreign Technology Div.

A STATISTICAL ANALYSIS OF IRREGULAR QUASI-OPTICAL LINES (BEAM GUIDES) WITH THE AID OF COMPUTER(S)

In its Antenna (Selected Articles) (FTD-ID(RS)T-0822-81) 16 Oct. 1981 p 1-20 refs Transl. into ENGLISH from Antenny (USSR), no. 9, 1970 p 53-61 (For primary document see N82-13323 04-32)

Avail: NTIS HC A04/MF A01 CSCL 20/14

Irregular quasi-optical lines (beam guides) are statistically analyzed using computerized simulation. The qualitative difference between the multimode and one mode beam guides is developed. Beam guides with different means of heterogeneities are investigated. S.L.

N82-13325# Air Force Systems Command, Wright-Patterson AFB, Ohio. Foreign Technology Div.

ONE USE OF METHODS OF THE STATISTICAL THEORY OF ANTENNAS

G. S. Bogoslovskiy and V. A. Usin *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0822-81) 16 Oct. 1981 p 21-39 refs Transl. into ENGLISH from Antenny (USSR), no. 9, 1970 p 62-71 (For primary document see N82-13323 04-32)

Avail: NTIS HC A04/MF A01 CSCL 20/14

Methods and apparatus for the statistical theory of antennas are used for determining the statistical characteristics of the 'noise' of transparent dielectric films. Film frequently characterized by dispersion and by a radius of the correlation of distortions is considered, as is the quantitative evaluation of the degree of the distortion of information. S.L.

N82-13326# Air Force Systems Command, Wright-Patterson AFB, Ohio. Foreign Technology Div.

DIRECTED DIVIDERS ON THE METAL-DIELECTRIC WAVEGUIDES

V. F. Dubrovin, D. I. Mirovitskiy, and L. S. Osipov *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0822-81) 16 Oct. 1981 p 40-60 refs Transl. into ENGLISH from Antenny (USSR), no. 9, 1970 p 72-80 (For primary document see N82-13323 04-32)

Avail: NTIS HC A04/MF A01 CSCL 20/14

Structurally simple waveguide frequency dividers of metal dielectrics were developed based on the principle of beam communication to ensure high electrical characteristics in the broadband. The dividers were fabricated in series using methods of printed technology. Electrical and structural characteristics are given for a two channel centimeter wave guide frequency divider. S.L.

ANTENNA (SELECTED ARTICLES)

16 Oct. 1981 126 p refs Transl. into ENGLISH from Antenny (USSR), no. 11, 1971 p 1-59
(AD-A106500; FTD-ID(RS)T-0826-81) Avail: NTIS HC A07/MF A01 CSCL 20/14

The electromagnetic characteristics of various antenna configurations are investigated. Particular emphasis is given to slot antenna and antenna array designs. For individual titles, see N82-13328 through N82-13332.

N82-13328# Joint Publications Research Service, Arlington, Va.

EXCITATION OF RADIAL RESONATOR WITH ANNULAR SLOT

V. A. Poperechenko *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0826-81) 16 Oct. 1981 p 2-24 refs Transl. into ENGLISH from Antenny (USSR), no. 11, 1971 p 3-14 (For primary document see N82-13327 04-32)
Avail: NTIS HC A07/MF A01 CSCL 20/14

The problem of the external and internal excitation of a radial resonator with a narrow annular slot, which radiates into a half space is considered. A question is raised about the completeness of a set of functions which describe the fields within the resonator during the excitation only by its alternating outside currents. A method of addition and integration of poorly converging series and integrals is applied. A technique for the strict solution of the electrodynamic problem is presented along with calculations of the fundamental parameters of the antenna: the distribution of voltage along the slot, the radiation pattern, polarizational characteristic, composite conductivity of the radiation, and input resistance. M.G.

N82-13329# Joint Publications Research Service, Arlington, Va.

SYNTHESIS OF NONEQUIDISTANT LINE-SOURCE ANTENNA BY THE STATISTICAL METHODS OF SEARCH

O. I. Levin *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0826-81) 16 Oct. 1981 p 25-51 refs Transl. into ENGLISH from Antenny (USSR), no. 11, 1971 p 15-26 (For primary document see N82-13327 04-32)
Avail: NTIS HC A07/MF A01 CSCL 20/14

The application of statistical optimization methods to the task of synthesizing nonequidistant rarefied gratings is examined. The task is comprised of stochastic system differential equations, the point of stable equilibrium of which is the point of the location of the unknown extremum of the functional of the mismatch of preset and synthesized diagrams. The results of the calculations of nonequidistant antenna arrays by the method are given. M.G.

N82-13330# Joint Publications Research Service, Arlington, Va.

PRINCIPLES OF THE CONSTRUCTION OF SYSTEMS, WHICH POSSESS POTENTIAL FREQUENCY INDEPENDENCE

B. I. Molodov *In* is Antenna (Selected Articles) (FTD-ID(RS)T-0826-81) 16 Oct. 1981 p 52-88 refs Transl. into ENGLISH from Antenny (USSR), no. 11, 1971 p 27-42 (For primary document see N82-13327 04-32)
Avail: NTIS HC A07/MF A01 CSCL 20/14

The development of design models for the construction of antennas with weak frequency dependence is discussed and related to broadband and super broadband equipment. The conditions for the similarity of fields are obtained from the Maxwell equations (which contain outside currents) by the methods of similitude theory. On the basis of these conditions, the general principles for the construction of systems which possess potential frequency independence are formulated. M.G.

N82-13331# Joint Publications Research Service, Arlington, Va.

NATURAL AND MUTUAL CONDUCTIVITIES OF HALF-WAVE SLOTS, ARBITRARILY ORIENTED ON THE CONDUCTING SURFACE OF CIRCULAR CYLINDER

I. F. Dobrovolskiy, V. M. Klyuyev, and A. I. Rogachev *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0826-81) 16 Oct. 1981 p 89-102 refs Transl. into ENGLISH from Antenny (USSR), no. 11, 1971 p 43-50 (For primary document see N82-13327 04-32)
Avail: NTIS HC A07/MF A01 CSCL 20/14

The asymptotic expression of an improper integral, giving tangential components of the field on the surface of an ideally conducting cylinder excited by magnetic current is found on the base of the representation of the functions of Hankel with Airy's functions. The obtained analytical expressions are applied for the calculation of natural and mutual conductivities of the arbitrarily oriented half-wave slots on a cylinder of comparatively large radius (ka > 10). The results of numerical calculations are given for different orientations of slots. M.G.

N82-13332# Joint Publications Research Service, Arlington, Va.

CHARACTERISTICS OF ANTENNAS WITH FREQUENCY BEAM SWINGING

D. B. Aimin and Y. S. Losev *In its* Antenna (Selected Articles) (FTD-ID(RS)T-0826-81) 16 Oct. 1981 p 103-122 refs Transl. into ENGLISH from Antenny (USSR), no. 11, 1971 p 50-59 (For primary document see N82-13327 04-32)
Avail: NTIS HC A07/MF A01 CSCL 20/14

The characteristics of line-source antennas with frequency beam swinging, intended for the use in the flat antennas with wide-angle beam swinging in two planes, are determined. It is claimed that for obtaining the high electrical characteristics in the flat plane antenna arrays it is expedient to utilize the line-source antennas, constructed on the base of waveguide kite circuits with the waveguide bends in the plane of the magnetic field. M.G.

THE MESSAGE PROCESSING AND DISTRIBUTION SYSTEM DEVELOPMENT M.S. Thesis

Kenneth Lee Whitten Jun. 1981 55 p refs
(AD-A104585) Avail: NTIS HC A04/MF A01 CSCL 17/2

A historical approach is used in presenting the life cycle development of the Navy's message processing and distribution system beginning with the planning phase and ending with the integrated logistic support phase. Several maintenance problems which occurred after the system was accepted for fleet use were examined to determine if they resulted from errors in the acquisition process. The critical decision points of the acquisition process are examined and constructive recommendations are made for avoiding the problems which hindered the successful development of this system. THREE-5 HETEROSTRUCTURE AVALANCHE PHOTODIODE MODULES FOR FIBER OPTIC COMMUNICATION LINKS IN THE 1.0 TO 1.3 MICROMETER SPECTRAL RANGE Final Report, Feb. 1978 - May 1980

R. Yeats and K. VonDessonneck Fort Monmouth, N.J. Army Communications Research and Development Command 1 Jan. 1981 69 p refs
(Contract DAAB07-78-C-2402; DA Proj. 1L1-62701-AH-92)
(AD-A099506; CORADCOM-78-2402-F) Avail: NTIS HC A04/MF A01 CSCL 17/2

Hybrid-structure InP-InGaAsP APDs have been fabricated which have negligible dark current I sub D < (6 nA at M = 30). The excess noise factor, F, for a hole initiated avalanche, has been determined to be F/M = 0.42 plus or minus 0.10 for 5 < or = M < or = 35. Conventional-structure high-bandgap (1.27 eV) InGaAsP APDs have been fabricated. These resemble low-leakage InP APDs rather than the high-leakage low-bandgap (1.00 eV) InGaAsP APDs. Low-noise bipolar transimpedance preamps have been designed and fabricated. These have bandwidths out to 500 MHz (for R sub f = 1 K Omega). The sensitivity of the best hybrid APDs used with these preamps is estimated to be - 46.6 dBm for a 100 Mbit/set, 10 to the minus 9th power bit error rate system, operating at a wavelength of 1.1 microns. SURFACE-PATCH TECHNIQUES FOR MODELING THREE-DIMENSIONAL RADIATING OR SCATTERING OBJECTS Final Technical Report, 15 Sep. 1978 - 15 Sep. 1980
Johnson J. H. Wang Griffiss AFB, N.Y. RADC Apr. 1981 76 p refs
(Contract F19628-78-C-0224; AF Proj. 2305)
(AD-A100212; RADC-TR-81-41) Avail: NTIS HC A03/MF A01 CSCL 20/3

A theoretical study of the surface patch technique for solving the electromagnetic fields of three-dimensional scattering and radiating geometries was conducted. Improved techniques for the numerical calculations were also developed. In particular, the Georgia Tech surface-patch algorithm was improved and tested for conducting prolate spheroids, circular and rectangular cylinders, and cubes. The numerical results were good even for the finite cyclinders with sharp edges. An electric field integral equation algorithm was also developed and tested satisfactorily on thin plate scattering problems. The merits of the triangular surface-patch for solving the general three-dimensional electromagnetic problems have thus been demonstrated. Author

FLOW CONTROL AND ROUTING IN AN INTEGRATED VOICE AND DATA COMMUNICATION NETWORK Ph.D. Thesis
Oliver Chukwudi Ibe Aug. 1981 118 p refs
(Contract N00014-75-C-1183; ARPA Order 3045)
(AD-A103342; LIDS-TH-1115) Avail: NTIS HC A06/MF A01 CSCL 17/2

A model of an integrated voice and data network, lending itself to analytic and algorithmic solution, and formulated as a convex optimization problem is considered. The model can be generalized to solve problems of networks which handle n types of traffic that have different levels of delay, sensitivity, where n < 2. A joint flow control and routing algorithm is constructed which uses short term average information on the network utilization to set the voice packet lengths and data input rates, and to determine the routes for each conversation. The voice packet lengths and data input rates are set in such a way as to achieve an optimal tradeoff between each user's satisfaction and the cost of network congestion. Additional protocols are specified for dealing with such issues as congestion avoidance and control, and for implementing flow control on a dynamic basis. Author

STANDARD BIT ERROR RATE (BER) VERSUS RECEIVED SIGNAL LEVEL TESTING Final Report
1 Sep. 1981 15 p refs
(AD-A104573; TOP-6-2-570) Avail: NTIS HC A02/MF A01 CSCL 17/2

Bit error rate (BER) bench testing of digital radios in a back-to-back mode determines hardware characteristics independent of external anomalies such as impulse noise, fading, and interfering signals. This method employs the statistic of a characteristic theoretical curve of a long term BER versus received signal level (RSL). The attenuation is initially set to produce a BER of approximately .0001 at a corresponding RSL. When this point on the curve is statistically valid long term BERs can be predicted to correspond with the RSL. Author

EXPERIMENTAL AND THEORETICAL INVESTIGATIONS WITH LABORATORY MODELS OF PHASED ARRAY ANTENNA
H. Lueg 1979 70 p refs In GERMAN; ENGLISH summary
(BMVg-FBWT-79-21) Avail: NTIS HC A04/MF A01; DOK-ZENTBw, Bonn DM 30

Phased arrays in the X band frequency range are studied. A theory is introduced, leading to the calculation of a conformal array of waveguide-fed aperture antennas. To test the theory, an antenna model was constructed. Printed antennas were considered for array application. Simple resonant, microstrip antennas were investigated. Theory and measurement agree. Dynamic theory leads to improvement in the design of mutually coupled active modules. Beam scanning of an active spherical antenna array was examined with respect to these results. An antenna array was set up with eight active elements and tested under computer control. For application of pulsed active modules in phased array antennas, measurement and compensation of frequency chirp are demonstrated feasible. Author (ESA)

INVESTIGATION OF MODULATION METHODS AND SYSTEM ASPECTS FOR REGENERATIVE SATELLITE-REPEATER Final Report
Sander Rasmussen, Werner Schreitmueller, and Rudolf Wrzesinsky Bonn Bundesministerium fuer Forschung und Technologie Sep. 1980 115 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-80-024; ISSN-0170-1339) Avail: NTIS HC A06/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 24.20

Various modulation methods are compared by means of a simulation program for carrier recovery circuits. This program incorporates Q phase shift keying with offset, real carrier and clock recovery systems, adjacent channel interference, and multipath effects. Applications are given for quadrature amplitude modulation systems envisaged for satellites. Q phase shift keying with and without offset, and coherent modulation and demodulation of frequency shift keying. Regenerative repeaters for satellite communication are shown to present many advantages and a special solution is proposed for effective control of fading on the downlink and the uplink of a satellite system. A fundamental concept of a regenerative satellite repeater is defined, allowing system variants to be chosen in function of the number and size of the ground stations. Author (ESA)

ENVIRONMENT SIMULATOR FOR RADAR SIGNALS ON THE DIGITAL LEVEL [RADARSIGNALMILJOESIMULATOR PAA DIGITAL NIVAA]

Bo Karlsson Mar. 1981 100 p refs In SWEDISH
(FOA-A-30025-E4) Avail: NTIS HC A05/MF A01

Environment simulation of radar signals on the HF and video level is generally done with digitally driven analog generators. For simulation on the digital level, the same analog generators may be used with analog to digital conversion of output signals. Theoretically a diversion is implied when only the digital output signal is desired. A test simulating device on the digital level is described with the aid of multiprocessing techniques and without the use of analog generators. Author (ESA)

SHORT-RANGE COMMUNICATIONS USING DIFFUSELY SCATTERED INFRARED RADIATION Ph.D. Thesis

Michael D. Kotzin 1981 87 p
Avail: Univ. Microfilms Order No. 8124932

Short range optical communication using diffusely scattered infrared radiation is examined. Aspects which relate to providing multichannel and duplex capability when one end of the link is not fixed, are considered. A link comparison is made between optical and microwave systems of similar complexity. Although it is shown that the optical system is not as sensitive as its microwave counterpart for typical ambient infrared backgrounds, it is advantageous with regard to spectrum availability and reuse, immunity from multipath distortion, and the maturity of the technology. Characteristics of the optical scatter propagation path are investigated using a static analytical model. Measurements of dynamic path loss provide data for the portable application. A signal to noise ratio enhancement is obtained by the use of short high power optical pulses. Selection of a digital modulation format permits the application of time division multiplex techniques to achieve the desired duplex and multichannel capability. System capabilities are demonstrated to be strongly influenced by device limitations, especially the light emitting diode (led) sources. A method of obtained receiver gain using detector optics is described and explained. Finally, the analysis and measured data are used to guide the design of a prototype portable telephone system providing two full duplex audio channels using digitally encoded speech is described. Dissert. Abstr.

SPECTRAL EFFICIENCY OF AMPLITUDE COMPANDED SIDEBAND SYSTEMS Ph.D. Thesis

Mark Alan Herro 1981 177 p
Avail: Univ. Microfilms Order No. 8124083

A computer model which incorporates the various factors affecting the performance of a mobile radio system in an interference dominated environment is used to compare the efficiency and service quality of both FM and amplitude companded sideband (ACSB) radios in different types of land mobile services. Techniques for modeling the adjacent channel performance and the effect of frequency error between two radios are developed. The ACSB radios have 1.5 to 2 times the range of the FM radio with equal power. With regards to adjacent channel interference, ACSB with 5 kHz channel separation performs as well as FM with 20 or 25 kHz separation. When both co-channel and adjacent channel interference are taken into account, ACSB is about 6 to 8 times more efficient than FM as far as maximizing the number of users supported per MHz per square kilometer in any given service area. Dissert. Abstr.

N82-13346 Stanford Univ., Calif.

TOPICS IN DIGITAL SIGNAL PROCESSING Ph.D. Thesis

Shankar Seshagiri Rao Narayan 1981 135 p
Avail: Univ. Microfilms Order No. 8124116

Three discrete Fourier transform (DFT) algorithms, namely, the fast Fourier transform algorithm (FFT), the prime factor algorithm (PFA) and the Winograd Fourier transform algorithm (WFTA) are analyzed and compared. A new set of short-length DFT algorithms well-suited for special purpose hardware implementations, employing monolithic multiplier-accumulators and microprocessors, are presented. Architectural considerations in designing DFT processors based on these algorithms are discussed. Efficient hardware structures for implementing the FFT and the PFA are presented. A digital implementation for performing linear-FM (LFM) pulse compression by using bandpass filter banks is presented. The concept of transform domain adaptive filtering is introduced. The DFT and the discrete cosine transform (DFT) domain adaptive filtering algorithm are considered. Applications of these in the areas of speech processing and adaptive line enhancers are discussed. A simple waveform coding algorithm capable of providing good quality speech at about 1.5 bits per sample is presented. Dissert. Abstr.

N82-13347 New Mexico Univ., Albuquerque.

ESTIMATION OF VARIABLE LATENCY SIGNALS VIA UNWRAPPED PHASE AVERAGING WITH APPLICATION TO VISUAL EVOKED POTENTIALS Ph.D. Thesis

Michael Antonio Rodriguez 1980 89 p
Avail: Univ. Microfilms Order No. 8123966

A formula for phase estimation via unwrapped phase averaging is developed empirically using simulations where signal and noise have similar spectral densities. The result is a phase estimator in which the parameters depend only on the signal-to-noise ratio. A relationship between signal phase error and signal waveform error is derived to assist in the selection of estimator parameters and to evaluate subsequent performance of the phase estimation procedure. A new cepstral function, the delay phase cepstrum, is also introduced and found to be useful in estimating the mean delay of a known signal waveform which has a variable latency in an ensemble of measurements. Extensive simulations indicate that estimation via unwrapped phase averaging can recover variable latency signals under very poor signal-to-noise conditions. Application of the new technique to the estimation of visual evoked potentials is presented and discussed. Dissert. Abstr.

AC HARMONIC FILTERING USING CONTROLLED CURRENT INJECTION Ph.D. Thesis

Gary Roy Dreifuerst 1981 238 p
Avail: Univ. Microfilms Order No. 8117511

Development of a test model demonstrating the feasibility of an active tracking filter for power system harmonics. The sources of power system harmonics are reviewed, including the effects harmonic have on communication and control systems. The standard harmonic filtering technique and converter control schemes which minimize harmonic production are discussed. Four approaches for harmonic filtering are considered. The active tracking filter theory is presented to a standard passive filter and compared using steady state simulation. A state-of-the-art multi-processor controlled model is designed and constructed. The model incorporates an extensive data acquisition unit which allows great flexibility for experimental work. The model test results are presented illustrating protection functions, steady-state operation, and dynamic responses which show that the active tracking filter approach is feasible. Dissert. Abstr.

N82-13349 Wisconsin Univ. - Madison.

DEVELOPMENT, ANALYSIS AND CONTROL OF THE INDUCTOR-CONVERTER BRIDGE Ph.D. Thesis

Mehrdad Ehsani 1981 357 p
Avail: Univ. Microfilms Order No. 8117512

The inductor-converter bridge (ICB) is a solid state DC-AC-DC power converter system for bidirectional, controllable, energy transfer between two high Q magnet coils. The analysis and control of the ICB system was investigated. The process of energy transfer between the coils is explained on the basis of a simple one line equivalent circuit. The changes in the average power, average coil currents, and voltages, as functions of time, are calculated by the conventional Fourier method of analysis. A method of analyzing the ICB circuit by the use of quadrometric functions and identities is presented. The method delivers closed form expressions in finite series form. Since the power in the ICB is controlled by phase and/or frequency modulation, a methodical way of executing phase frequency shifting transients, without upsetting the normal operating conditions of the system was developed. A time optimal, load current feedback, control algorithm was developed, based on the analytically understood behavior of the system. Testing and experimental evaluation of the control algorithm are described. Dissert. Abstr.

N82-13350 Stanford Univ., Calif.

CHARGE-BASED MODELING OF CAPACITANCE IN MOS TRANSISTORS Ph.D. Thesis

Donald Edward Ward 1981 162 p

Avail: Univ. Microfilms Order No. 8124169

Conventional transistor models for the transient simulation of MOS circuits are formulated in terms of nonlinear capacitors. A charge-based model was developed to overcome errors and to account for the bulk charge. It is shown that the capacitances between any pair of terminals are nonreciprocal. Bulk-source, bulk-drain, and drain-source couplings are modeled, as are gate-to-bulk capacitances in saturation. The drain-source capacitances are negative. The capacitance characteristics of the model verified experimentally. The impact of the charge-based model on simulation of practical circuits was considered. Although the model is particularly useful in simulating silicon-on-insulator circuits, it gives improved simulation of bulk MOS technologies as well. Although the derivations are strictly valid only for long-channel devices operating at low speed, the model should prove useful for the simulation of practical circuits using state-of-the-art technology. Extensions of the model to short-channel devices and high-speed operation are discussed.

Dissert. Abstr.

N82-13351 Northwestern Univ., Evanston, Ill.

CONDUCTIVITY AND PERMITTIVITY MEASUREMENTS OF FAST ION CONDUCTORS IN THE MICROWAVE REGION Ph.D. Thesis

Thomas Tang Yum Wong 1981 216 p

Avail: Univ. Microfilms Order No. 8125042

The conduction and dielectric properties of fast ion conductors in the microwave and radio frequency regions are investigated. Techniques of microwave dielectric spectroscopy pertinent to fast ion conductors are studied. Special effort is devoted to polycrystalline materials. Ag2HgI4 is chosen as the model material. Observed spectra and thermal activation effects reveal distinctive features separating the ionic conducting alpha-phase (above 50 C) from the electronic conducting beta-phase (below 50 C). Transport processes in the former can be described by hopping models whereas those in the latter can be accounted for as the remains of the infrared oscillator mode. Based on rate theory, a simple model giving the dielectric response associated with hopping conduction is constructed. It is demonstrated that in order to give a realistic description of ionic motion in the dc limit, one must consider the flux of ion across the potential barrier rather than the rate of change of polarization or the continuity equation. Explicit equations relating the complex conductivity to lattice parameters and temperature are derived. Dissert. Abstr.

N82-13352 Stanford Univ., Calif.

LINEAR ACOUSTO-OPTIC FILTERING WITH HETERODYNE AND FREQUENCY-PLANE CONTROL Ph.D. Thesis

Jerry Lee Erickson 1981 306 p

Avail: Univ. Microfilms Order No. 8124059

The basic principles, characteristics and limitations of the linear, acousto-optic, heterodyne, frequency plane (LAHF) filter are described. The related area of phase distortion introduced by the acousto-optic interaction is also examined. A general LAHF filter response is derived. A specific LAHF filter response form useful for narrowband frequency rejection is studied with computer simulation and verified experimentally. Tradeoffs among window apodization, frequency rejection notch width, and filter time delay are discussed. The properties of heterodyne detection with a large-area photodetector in relation to the LAHF filter are examined. The dynamic range of the LAHF filter is calculated and optimized. The signal-to-noise ratio is seen to be inversely proportional to the filter time-bandwidth product. Acousto-optic phase distortion is also studied and related to phase distortion in the LAHF filter response. One source of potential phase distortion is shown to be the planar, acousto-optic-medium-to-air boundary. Another source of acousto-optic phase distortion is shown to be the acousto-optic diffraction process. To demonstrate this, a new highly accurate model for weak acousto-optic diffraction in isotropic media is derived. Dissert. Abstr.

N82-13353 Stanford Univ., Calif.

A RELATIVISTIC MAGNETRON WITH A THERMIONIC CATHODE Ph.D. Thesis

William Parker Ballard 1981 165 p

Avail: Univ. Microfilms Order No. 8124030

The design and development of a relativistic magnetron are described. Target pulse lengths of one microsecond and mean pulse powers of one gigawatt were selected and an oxide cathode was chosen because the space-charge should inhibit vacuum dc breakdown between the anode and cathode, thus allowing longer pulses than are achieved with other relativistic designs employing cold, field-emitting cathodes. A high power tube was nonrelativistically scaled to an operating voltage of 500 kilovolts. The resulting anode has twelve resonators and was operated with one end short-circuited to rf. An impregnated tungsten matrix cathode and a coated cathode were tested. The coated cathode, which was found to be more tolerant of the poor vacuum, emitted successfully. A rf measurement technique provided simultaneous power and frequency information during each pulse. The magnetron operated in the desired mode at power levels of about 20 megawatts for pulse lengths of about 35 nanoseconds. Dissert. Abstr.

N82-13354 Stanford Univ., Calif.

FREQUENCY SAMPLING FILTERS, DESIGN AND APPLICATIONS Ph.D. Thesis

Amnon Aliphas 1981 126 p

Avail: Univ. Microfilms Order No. 8124027

A linear programming method of reduced complexity is developed for the design of FIR frequency sampling digital filters. The frequency sampling method can be used directly in the frequency domain when implementing filtering by fast convolution using discrete Fourier transforms. For narrowband filters or filter banks, methods are shown which significantly reduce the required multiplication operations per data point in filter implementations. A general result is presented on the problem of finding the zeros of the transfer function of an FIR filter. This problem arises when it is necessary to convert a linear phase digital filter design into a minimum phase design. It also arises if it is desired to implement a high order filter by the cascading of a number of low order filters. A method is developed for the computation of the zeros of filters which have been designed by the frequency sampling technique. For such designs the locations of all zeros on the unit circle are known. Dissert. Abstr.

N82-13355 Wisconsin Univ. - Madison.

DIRECT DIGITAL SIMULATION OF POWER SEMICONDUCTOR-CONTROLLED ELECTRICAL MACHINES Ph.D. Thesis

Hamdy Mohamad Bahnassy 1981 605 p

Avail: Univ. Microfilms Order No. 8120296

Generalized computer programming techniques for simulating power semiconductor-controlled electric machines in coil-variable representation are presented. These techniques are developed primarily for implementation in large scale general purpose computer-aided design and analysis (CADA) circuit programs. To demonstrate the validity of the developed techniques, a coil-variable model of a brushless synchronous generator with an ac exciter and rotating rectifiers was constructed. The performance of the control system (thyristor voltage regulator) is represented by a transfer function block diagram model. The CADA circuit program used is the recently developed SUPER SCEPTRE program. The model is validated using the design data and test results of a 60 kVA brushless generator. Numerous computer simulation cases are presented including the steady state and transient conditions. Brushless generator performance under diode failure faults (opened-diode, shorted-diode) is simulated. The effects of the external faults, at the main generator terminals, on the main generator, as well as its excitation system currents, are simulated. Dissert. Abstr.

These papers discuss electron trapping on sites related to H2O, the subsequent interface states generated by the trapping, and the reduction of these traps by high temperature nitrogen annealing. Radiation induced neutral trapping centers are discussed in relation to electron or hole capital on them. A new electrically alterable memory device using a dual electron injector structure composed of silicon-rich silicon dioxide and silicon dioxide layers is described. Material characterization is the Fi-rich SiO subscript 2 film, discussed using attenuated total reflectance, raman scattering, and optical absorption measurements. Detection of trap impurities, on Fi surfaces is studied using electron trapping character techniques. Author (GRA)

(Contract N00014-79-C-0880; SRI Proj. 1013)
(AD-A104582) Avail: NTIS HC A03/MF A01 CSCL 09/1

The preparation of iridium films for thermionic cathodes by chemical vapor deposition is described. The deposition from IrC13/H2/CO atmospheres was very inefficient; however, iridium was deposited from IrF3/H2/CO at 465 C + or - 25 C with reasonable efficiency. The majority of the deposits were porous or loose powders. An attempt to deposit iridium on a substrate designed to produce a microporous film was unsuccessful because of the poor throwing-power of the process. Author

EXPLOSIVE-METAL COMPOSITES AND ELECTRICAL SWITCH TECHNOLOGY Final Report
M. J. Frankel and P. J. DiBona 13 Apr. 1981 21 p refs
Sponsored in part by AF
(AD-A099476; NSWC/TR-80-497) Avail: NTIS HC A02/MF A01 CSCL 11/4

A number of different explosive opening switch concepts were investigated. The fabrication of a composite material by the impregnation of a porous metallic matrix by an explosive utilizing a vacuum melt cast technique was demonstrated. Successful initiation and steady detonation wave propagation was demonstrated with use of the Jacobs rapid framing camera while the electrical conductivity through the sample was measured with an oscilloscope. This type of switch is shown to have the potential of switching large electrical currents in times on the order of 10 microns with savings in weight and volume as compared to the geometries used in other explosive switches. BOUNDING SIGNAL LEVELS AT TERMINATIONS OF MULTICONDUCTOR TRANSMISSION LINE BEHIND AN APERTURE Scientific Final Report, 1 Feb. 1980 - 15 Apr. 1981
W. A. Davis and Sistanizadeh 4 Jun. 1981 128 p refs
(Grant AF-AFOSR-0138-80)
(AD-A102031; AFOSR-81-0587TR) Avail: NTIS HC A07/MF A01 CSCL 09/1

A technique for bounding the maximum voltages and currents at terminations of a multiconductor transmission line located behind an aperture-perforated conducting screen excited by an electromagnetic pulse is developed. The electromagnetic field is coupled through a small aperture to provide the excitation of a multiconductor transmission line behind the aperture. A model is presented in terms of external and internal sources which in turn creates traveling waves on the multiconductor transmission line. Upper bounds are obtained using vector norms and associated matrix norms. The frequency domain is formulated and transformed to the time domain to obtain useful upper bounds for transient analysis of multiconductor transmission line geometries with aperture excitation. SOME EXPERIENCES WITH THE USE OF CASTOR OIL AS A DIELECTRIC
Vernon A. Nieberlein Jan. 1981 23 p refs
(AD-A102348; AD-E950151) Avail: NTIS HC A02/MF A01

CSCL 11/8

The use of large volumes of castor oil for dielectric purposes is reported. The experiences include corrosion of brass parts by the oil, drying of the oil, and the determination of water in the two-phase system of caster oil in contact with mineral oil. A detailed design of a packed column for drying castor is also presented. Author

DESIGN AND FABRICATE A CCD ANALOG MULTIPLIER Final Technical Report, 30 Sep. 1977 - 31 Oct. 1980

Jay P. Sage and Douglas E. Greetham Griffiss AFB, N.Y. RADC Aug. 1981 136 p refs
(Contract F19628-77-C-0260; AF Proj. 2305)
(AD-A105557; BR12597; RADC-TR-81-155) Avail: NTIS HC A07/MF A01 CSCL 09/5

A CCD-based correlator/convolver having 256 stages at which two analog signals are multiplied and summed has been designed, fabricated and tested. The design employs two dual-channel (surface channel) CCD's, source-follower buffered switched floating gate taps at each stage, diode injection input; and as the key 'breakthrough' element in the design, the analog multipliers are configured as four-transistor MOSFET balanced bridges. Various elements in the design were chosen and tested in isolation and combination both by means of computer simulations, and by a series of test 'pattern mask measurements in three wafer fabrication phases. Despite the size and complexity of the chip (8.7 Mn x 3.25 Mn, 4128 CCD cells and 4132 transistors), a good yield of 256 stage devices that functioned satisfactorily as correlators was obtained. On the basis of limited testing, the level of performance, however, fell short of that expected from previous component tests notably in the area of linearity of correlation (+ or - 5% rather than + or - 1%) and in speed (< or = 1 MHz rather than 10 MHz). Suggestions for further tests and experiments are given. Author (GRA)

EFFECT OF GATE OXIDE THICKNESS ON THE RADIATION HARDNESS OF SILICON-GATE CMOS

T. V. Nordstrom and C. F. Gibbon 1981 24 p refs Presented at the IEEE Conf. on Nucl. Sci. and Space Radiation, Seattle, 21 Jul. 1981
(Contract DE-AC04-76DP-00789)
(DE81-027202; SAND-81-1680C; CONF-810797-7) Avail: NTIS HC A02/MF A01

Significant improvements have been made in the radiation hardness of silicon-gate CMOS by reducing the gate oxide thickness. The device studied is an 8-bit arithmetic logic unit designed with Sandia's Expanded Linear Array standard cells. Devices with gate oxide thickness of 400, 570 (standard), and 700 A were fabricated. N- and P-channel maximum threshold shifts were reduced by 0.3 and 1.2 volts, respectively, for the thinnest oxide. Approximately, a linear relationship is found for threshold shift versus thickness. The functional radiation hardness of the full integrated circuit was also measured. DOE

TWO-DIMENSIONAL EFFECTS IN POWER TAKE-OFF REGION

M. Ishikawa and Y. C. L. Wu May 1981 29 p refs
(Contract DE-AC02-79ET-10815)
(DE82-000091; DOE/ET-10815/55) Avail: NTIS HC A03/MF A01

A two-dimensional analytical model of the power take-off (PTO) region of a diagonal conducting wall MHD generator is presented and compared with experimental results. Reasonable agreement was found in both voltage and current distributions from the two-dimensional analysis, while similar comparison of experimental data with one-dimensional calculations with experiments was not satisfactory. Power take-off from mid-channel was also investigated. It was found that larger current was carried by these electrodes. In addition, large circulating current was found in the sidewalls resulting from diagonalization. Therefore ballast resistors are required to equalize the current. A general PTO resistor design was proposed. Trade-off considerations between power output and protection of over-current were made. DOE

EVALUATION OF ADVANCED TECHNOLOGIES FOR POWER TRANSFORMERS Final Report

Jan. 1981 173 p refs
(Contract DE-AC01-77ET-29069)
(DE82-000793; NYSERDA-81-8) Avail: NTIS HC A08/MF A01

The high insulating strength of certain gases, such as sulfur hexafluoride, when used at high pressure, suggests that there may be advantages to compressed gases as the insulating fluid in power transformers. However, simply exchanging the oil for compressed gas in an otherwise conventional transformer design will not yield a significant overall advantage. Compressed gases present the engineer with properties which are quite different from mineral oil. If gases are to be used as the major insulating fluid in power transformers, then virtually all aspects of the insulation and cooling of the apparatus must be reconsidered, affording an opportunity to introduce new design concepts, new materials, and new construction techniques. In this program, the feasibility of using the following principal design concepts has been explored: sheet conductors for the windings; a system of sealed, self-contained, annular cooling ducts containing circulating cooling fluid to cool the windings; polymer film for turn-to-turn insulation; and compressed gas insulation. Experimental and analytical studies, described in this report, indicate that the sheet-wound, compressed-gas-insulated design should result in power transformers of significantly smaller size and weight when compared with oil-filled units of equivalent rating. These advanced technologies offer the opportunity for the design of more efficient power transformers. DOE

FURTHER DEVELOPMENTS IN INTEGRATED CIRCUIT ASSEMBLING TECHNOLOGY Final Report

Hans Ullrich Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 62 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-80-179; ISSN-0340-7608) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 13

Recent developments aiming at full automation in the assembling technology of plastic encapsulated integrated circuits (IC) are described, covering die separation, chip adhesion and wire bonding. For IC die separation in individual chips, a diamond sawing procedure which replaces the traditional scratch and break technique is proposed. Die attachment by means of a silver-filled adhesive was extended to MOS and power devices. A half-automated universal chip adhesion machine was designed and tested. A positioning system based on chip edge pattern recognition was developed. The prototype of a fully automated wire bonding system was successfully tested. The technical and economical advantages of these improved technologies are discussed. Author (ESA)

VALIDATION, MODELING, AND COMPUTER ASSISTED DESIGN PROGRAM FOR POWER CONVERTERS Final Report [VALIDATION, MODELISATION ET LOGICIEL DE CONCEPTION ASSISTEE DES CONVERTISSEURS DE PUISSANCE]
M. Clique and A. J. Fossard Paris ESA Jun. 1981 82 p refs In FRENCH
(Contract ESTEC-3652/78/NL-AK(SC))
(ESTEC/DERA-8/7208; ESA-CR(P)-1454) Avail: NTIS HC A05/MF A01

Work carried out in order to determine the dynamic performance of dc/dc converters is summarized. The modeling of limit cycling current control as well as maximum current control (buck; boost) is briefly discussed, emphasizing the adaptability of the method. The computerized design program used in describing the systems in which the converters operate is mentioned, again pointing out its flexibility. The recording and processing of measurement data from breadboard model converters is then reported on. Least squares was employed as an identification method with all converters. Measured results and predicted results agree well up to approximately 2 or 3 KHz. At higher frequencies the introduction of parasite effects into the program and the precise modeling of certain complex filters remains problematic. Author (ESA)

ANAMOLOUS LOSS IN TRANSFORMER STEELS Ph.D. Thesis
Bryen Edward Lorenz 1981 103 p
Avail: Univ. Microfilms Order No. 8118932

Energy losses in transformer steels, specifically silicon-iron, are investigated. In the model proposed discontinuous magnetization transition, is introduced as a loss mechanism, in addition to the continuous magnetization change produced through domain wall motion. This extra mechanism is in the form of discrete sites, distributed randomly throughout the sample, which are statistically activated to switch through the action of the wall in depinning the sites. Once unpinned the sites have a relaxation time that is independent of the frequency of magnetization. The effect of two such sites is computed by using standard boundary value techniques to yield the generated eddy currents. By averaging both spacially and temporally over a cycle, the effect of an ensemble of these sites can be determined. Dissert. Abstr.

A SIMPLIFIED TWO-DIMENSIONAL NUMERICAL ANALYSIS OF MOS DEVICES INCLUDING TRANSIENT PHENOMENA Ph.D. Thesis
Soo-Young Oh 1981 162 p
Avail: Univ. Microfilms Order No. 8124123

A two-dimensional approached for steady state analysis based on the boundary-value (BV) method is described. It solves the current-continuity equations numerically along the channel, with appropriate two-dimensional field coupling to the boundary conditions to include the two-dimensional and distributed-circuit effects. Because the nodes are allocated only along the boundaries and channel, their number is nearly two orders of magnitude smaller and the calculation speed is one order of magnitude faster than those obtained by either the finite-difference or finite-element method. The BV method was employed to analyze the transient characteristics of MOS transistors. The accuracy of the quasi-static model was studied and important transient phenomena such as the delay time caused by channel transit and charge pumping current were investigated through both measurements and simulation. Short-channel effects were also simulated and predicted by the new method. Dissert. Abstr.

BIPOLAR CONDUCTION WITH a.c. EXCITATION Ph.D. Thesis
Walter Devaun Stanaland 1981 361 p
Avail: Univ. Microfilms Order No. 8124457

A mathematical model of the bipolar drift dominated conduction process utilizing ac voltage excitation in dielectric liquids was developed to obtain numerical solutions for the time dependence of the spatial electric field and charge density distributions along with terminal current. The disagreement between theory and measurement is investigated by a refined conduction model based on charged particle transport, an equivalent circuit based on particle characteristics and an orientational polarization model of the particles. Since the collection of particles on an electrode during a half cycle depends on particle mobility and half cycle time, the number of particles collecting on the electrodes undergoing orientational polarization increases with decreasing frequency. Particle mobility is shown to be proportional to charge. It is concluded that the modeling and measurement processes which explain the electric field and charge density distributions depend on particle characteristics such as number density, size, mass, charge, mobility, and viscous drag coefficient. APPLICATION OF THE METHOD OF WEIGHTED RESIDUALS TO THE BOUNDARY LAYER MOMENTUM AND TURBULENT STRESS TRANSPORT EQUATIONS Ph.D. Thesis
Donald William Davis, Jr. 1981 181 p
Avail: Univ. Microfilms Order No. 8123631

A method for the analysis of the turbulent boundary layer under the influence of a pressure gradient is developed. The governing equations are the continuity equation, the boundary layer mean momentum equation, and the boundary layer turbulent kinetic energy equation. The kinetic energy equation is transformed into an equation which governs the transport of turbulent shear stress. This transformation is accomplished through the use of three empirical functions which relate the turbulent kinetic energy, the turbulent energy diffusion, and the turbulent energy dissipation to the Reynolds stress. These empirical functions are determined completely from zero pressure gradient boundary layers. The method is applied to several sets of experimental data including flows with zero pressure gradient, favorable pressure gradient, and adverse pressure gradient. Results are given for comparisons of skin friction coefficient, thickness parameters, mean velocity profiles, and Reynolds stress profiles. Dissert. Abstr.

SEPARATE NUMERICAL TREATMENT OF ATTACHED AND DETACHED FLOW REGIONS IN GENERAL VISCOUS FLOWS Ph.D. Thesis
Ulgen Gulcat 1981 134 p
Avail: Univ. Microfilms Order No. 8124291

A method for the separate computation of the attached and detached region in a general viscous flow is presented. The method is mainly based on a general kinematic relationship between the velocity and the vorticity fields. This relationship permits the needed boundary conditions for the boundary layer region to be determined accurately and uniquely from a knowledge of the vorticity distribution. The kinetic part of the flow deals with the vorticity transport equation. The method yields a numerical procedure treating the boundary layer equations in the attached and Navier-Stokes equations in the detached regions of the flow. The accuracy and the versatility of the method is demonstrated by treating some simple flow geometries, namely flow past a finite plate and flow past a circular cylinder. The results obtained are in good agreement with the available solutions and with the experimental data. Finally, the flow past a 9 percent thick symmetric Jouskowski airfoil at 15 deg angle of attack is investigated. The results are presented in terms of streamlines, equi-vorticity contours, surface pressure and surface vorticity distributions at various time levels. Dissert. Abstr.

A spray system for a multi-ingredient ablative material wherein a nozzle A is utilized for suppressing overspray is described. The nozzle includes a cyclindrical inlet which converges to a restricted throat. A curved juncture between the cylindrical inlet and the convergent portion affords unrestricted and uninterrupted flow of the ablative material. A divergent bell-shaped chamber and adjustable nozzle exit B is utilized which provides a highly effective spray pattern in suppressing overspray to an acceptable level and producing a homogeneous jet of material that adheres well to the substrate.

APPLICATION OF A GRAVITY-DRIVEN WICKLESS HEAT PIPE FOR ICE PRODUCTION IN A COLD ENERGY STORAGE SYSTEM Ph.D. Thesis
Shun-Lung Chao 1981 255 p
Avail: Univ. Microfilms Order No. 8123621

Use of seasonal cold storage for space cooling is considered. A simplified analytical model, simulated by a computer program, was developed to predict the system performance. Experiments were performed to study the effects of various parameters on the ice formation. Parameters studied include the quantity of working fluid, condenser length, coolant inlet temperature, cooling time, type of working fluid, and inclination of the heat pipe. The effects of these parameters on the volume and shape of the resulting ice formation and on the wall temperature distribution along the heat pipe are illustrated. Evaporation and condensation phenomena within the heat pipe were investigated. The influence of natural convection on the geometry and structure of the ice is also discussed. The analytical model was found to be adequate for predicting the rate of ice formation and the geometry associated with the ice-water interface, and was verified by comparisons with experimental observations. Dissert. Abstr.

THE RELATIONSHIP BETWEEN THE ACOUSTIC IMPEDANCE AND UNSTEADY FLOW FIELD NEAR THE ORIFICE OF A TWO DIMENSIONAL HELMHOLTZ RESONATOR IN GRAZING FLOW Ph.D. Thesis
Bruce Eliot Walker 1981 161 p
Avail: Univ. Microfilms Order No. 8122878

The acoustic impedance of single and multiple orifice Helmholtz resonators which changes from its nominal value when the resonator is exposed to a steady grazing flow across its orifice(s) is discussed. The acoustic resistance rises, approximately proportionally to the speed of the grazing flow, while the acoustic reactance decreases. To understand better the physical mechanisms responsible for these changes, the unsteady flow of field within and near the orifice of a two dimensional single orifice Helmholtz resonator was measured on a microscopic scale. The data were displayed as waveforms, Fourier Series, perturbation velocity vector maps and pathline traces. Two models of the flow are suggested. Dissert. Abstr.

ENERGETICS AND DYNAMICS OF DROPLET EVAPORATION IN HIGH TEMPERATURE INTERMEDIATE REYNOLDS NUMBER FLOWS Ph.D. Thesis
Metin Renksizbulut 1981 236 p
Avail: Univ. Microfilms Order No. 8124986

Nusselt Numbers and drag coefficients of single-component liquid droplets and solid spheres in high temperature, intermediate Reynolds Number flows were investigated. The evaporation of suspended water, Methanol and n-Heptane droplets were followed in laminar air streams up to 1059 K in temperature using a steady-state measurement technique. It is found that the dynamic blowing effect of evaporation causes large reductions in heat transfer rates, and that the film conditions constitute an appropriate reference state for the evaluation of thermophysical properties. The numerical results indicate that the blowing effect of evaporation on momentum transfer is to reduce friction drag very significantly but at the same time increase pressure drag by almost an equal amount; the net effect on the total drag force being only a marginal reduction. In all cases, it is found that thermophysical property variations play a very dominant role in reducing the drag forces acting on cold particles. Results are analysed and a correlation for stagnation-point heat transfer is also presented. Dissert. Abstr.

N82-13380 Nevada Univ., Reno.
EXPERIMENTAL DETERMINATION OF THE EFFECT OF PHYSICAL PROPERTIES ON THE DRAG OF LIQUID DROPS Ph.D. Thesis
Phillip Hugh Gillespy 1981 70 p
Avail: Univ. Microfilms Order No. 8123955

The drag coefficient of drops of various liquids falling in air was measured experimentally. In one series of measurements the viscosity was changed while the surface tension was held constant, thus isolating the effects of liquid viscosity. It was found that the drag increased as the viscosity increased up to a value of 50 centipoises when essentially infinite viscosity was reached and there was no further increase in drag. Differences in the properties of Newtonian and non-Newtonian liquids were tested by thickening liquids with different agents. No difference in the drag due to the inherent rheological properties of Newtonian and non-Newtonian liquids were measured. With the effect of viscosity isolated, the effect of surface tension alone was then determined. All measurements were analyzed and empirical formulas expressing the drag coefficient in terms of the viscosity, surface tension, and Reynolds number were deduced.

Dissert. Abstr.

N82-13381 Northwestern Univ., Evanston, Ill.
NUMERICAL METHODS FOR THE ANALYSIS OF FLUID-STRUCTURE INTERACTION PROBLEMS Ph.D. Thesis
Robert Louis Mullen 1981 240 p
Avail: Univ. Microfilms Order No. 8124961

Numerical methods for the solution of transient two-dimensional and axisymmetric three-dimensional fluid solid interaction problems are developed and analyzed. Conservation laws for this kinematic description are developed in both differential and variational forms. The use of an arbitrary moving reference frame for the kinematic description allows the interior of the fluid region to be modeled by a conventional Eulerian description while the solid region is modeled using a Lagrangian description. Since the arbitrary moving frame includes both Eulerian and Lagrangian descriptions as subsets, the interface condition between the fluid and solid can be determined from the kinematics and conservation laws. An implicit finite element approximation is constructed for the governing equations. The properties of the discrete formulation are studied for perturbation and spectral methods. The treatment of impact problems by discrete methods is also examined. Methods to mitigate the additional errors associated with impact problems are given. Dissert. Abstr.

N82-13382 Stanford Univ., Calif.
IMPACTS OF VERTICAL SCALE DISTORTION ON TURBULENT MIXING IN HYDRAULIC MODELS Ph.D. Thesis
Benjamin Rush Roberts 1981 239 p
Avail: Univ. Microfilms Order No. 8124141

A variable distortion physical modeling facility representing a typical cooling pond or lake with a surface jet discharge and submerged power plant intake was used to investigate vertical scale distortion. The primary goals of the study were to establish a quantitative relationship between model scale distortion and turbulent mixing, and to develop a data base (including mean and turbulent quantities, density variations, and flow patterns) which can be used to test and calibrate three-dimensional numerical models. An analytical study of the full equations governing mean and turbulent processes in open water bodies is used to produce, using dimensional analysis techniques, a set of non-dimensional equations which show the impacts of distortion on the terms in the equations. The ultimate result is a set of theoretical predictions for distortion-related impacts on turbulence and mixing. The analytic and experimental results demonstrate a consistent under-prediction of turbulence intensities, vertical mixing rates, and jet dilution by distorted physical models. The far-field impacts of distortion which are observed include modification of advective flow patterns, reduction in boundary friction effects, and increased transverse and longitudinal dispersion. Dissert. Abstr.

AERODYNAMIC HEATING ON THE CORRUGATED SURFACE OF A 10.2 DEG HALF-ANGLE BLUNTED CONE AT MACH 6.7

Irving Weinstein, Don E. Avery, and L. Roane Hunt Dec. 1981 45 p refs

(NASA-TP-1928; L-14679) Avail: NTIS HC A03/MF A01 CSCL 20D

A 10.2 deg half-angle blunted cone with corrugated surfaces was tested in the Langley 8-foot high-temperature structures tunnel to measure the aerodynamic heating of its surfaces. The tests were made in a turbulent boundary layer at angles of attack of 0 deg, 5 deg, and 10 deg. Heating of the windward side was in reasonable agreement with theoretical turbulent predictions for a smooth cone, while heating on the leeward side was between laminar and turbulent predictions as a result of local transitional flow or flow separation produced by high lee-side pressures. Localized heating measurements indicated a significant increase in heating at large cross-flow angles, with the maximum heating rates occurring where the flow reattaches on the upstream side of the corrugation crest and the minimum occurring on the downstream side where the flow is separated. TECHNICAL EVALUATION REPORT ON THE FLUID DYNAMICS PANEL SYMPOSIUM ON COMPUTATION OF VISCOUS-INVISCID INTERACTIONS

J. C. LeBalleur Oct. 1981 21 p refs Partly in ENGLISH; Partly in FRENCH Symp. held at Colorado Springs, 29 Sep. - 1 Oct. 1980

(AGARD-AR-171; ISBN-92-835-0300-7) Avail: NTIS HC A02/MF A01

The status of current research in computational aerodynamics based on methods solving a viscous-inviscid interaction problem is surveyed. In spite of limitation in the models or numerical techniques for shock wave boundary layer interaction or trailing edge problems, the situation is well advanced in unseparated, steady two-dimensional flow, with the potential approximation for the inviscid part. Progress has advanced in the computation of separations, based on strong interaction models. It would be fruitful to make use of the complete Euler equations in transonic flow. Progress toward strong interaction methods is much less advanced in unsteady or three-dimensional flow, but seems likely. The development of strong interaction methods, highly connected with that of Inviscid and Navier-Stokes numerical techniques, appears as mandatory to having access to practical application needs. (LOG-J12276) Avail: NTIS HC A03/MF A01

Based on semiempirical considerations, simple formulas are proposed to describe the flowfield of a highly underexpanded jet exhausting from a sonic or supersonic nozzle. Correlations for density distribution and Mach disc distance include the influence of all governing parameters in the continuum regime. Regarding pressure distribution on a wall impinged by a jet, non-dimensional quantities are defined that greatly reduce the number of parameters involved in the correlations. Formulas and correlations are compared with original as well as previously published experimental results. The degree of rarefaction is discussed. Results on jet-wall interaction are thought to be of practical interest for the design of spacecrafts or launch vehicles. Author

EXPERIMENTAL AND ANALYTICAL INVESTIGATION OF A FLUIDIC POWER GENERATOR

V. Sarohia, L. Bernal, and R. B. Beauchamp 15 Nov. 1981 81 p refs

(Contract NAS7-100)

(JPL-Pub-81-100) Avail: NTIS HC A05/MF A01 CSCL 20D

A combined experimental and analytical investigation was performed to understand the various fluid processes associated with the conversion of flow energy into electric power in a fluidic generator. Experiments were performed under flight-simulated laboratory conditions and results were compared with those obtained in the free-flight conditions. It is concluded that the mean mass flow critically controlled the output of the fluidic generator. Cross-correlation of the outputs of transducer data indicate the presence of a standing wave in the tube; the mechanism of oscillation is an acoustic resonance tube phenomenon. A linearized model was constructed coupling the flow behavior of the jet, the jet-layer, the tube, the cavity, and the holes of the fluidic generator. The analytical results also show that the mode of the fluidic power generator is an acoustical resonance phenomenon with the frequency of operation given by f approx = a/4L, where f is the frequency of jet swallowing, a is the average speed of sound in the tube, and L is the length of the tube. Analytical results further indicated that oscillations in the fluidic generator are always damped and consequently there is a forcing of the system in operation. M.D.K.

THE TRANSONIC FLOW FIELD FOR A FLUIDIC-GENERATOR FUZE ASSEMBLY

John J. Bertin, Timothy E. Hayden, and Richard L. Goodyear Adelphi, Md. Harry Diamond Labs. May 1981 65 p refs

(Contract DAAK21-80-P-5171)

(AD-A099616; HDL-CR-81-171-1) Avail: NTIS HC A04/MF A01 CSCL 20/4

Static-pressure measurements and Pitot-pressure measurements were obtained for different nose configurations during wind tunnel tests. The test conditions included free-stream Mach numbers from .95 to 1.3 over a range of free-stream densities simulating altitudes from 15,240 m to 21,030 m. The pressure data from these tests were analyzed to describe the internal and the external flow fields. The pressures measured at the inlet hole for the fluidic-generator assembly is in close agreement with that given by the normal shock relations. The experimentally determined pressure ratio decreased as the free-stream Mach number increased for all external orifices from x = 0.030 x sub o to 1.000 x sub o. Since flow through the fluidic-generator assembly is choked by the nozzle centerbody, the mass-flow rate can be correlated in terms of the external flow conditions. Author

FLOW DISTRIBUTION CONTROL CHARACTERISTICS IN MARINE GAS TURBINE WASTE-HEAT RECOVERY SYSTEMS. PHASE 1: FLOW DISTRIBUTION CHARACTERISTICS AND CONTROL IN DIFFUSERS Annual Technical Report, Jul. 1980 - Jul. 1981

Simion C. Kuo and Ho-Tien Shu Aug. 1981 121 p refs
(Contract N00014-80-C-0476; NR Proj. 097-411)
(AD-A104560; UTRC/R81-955200-4) Avail: NTIS HC A06/MF A01

Flow distribution problems have become increasingly important in the design of modern fluid flow and heat transfer systems. Flow distribution characteristics and control of marine gas turbine exhaust flow is studied. Major technical problems associated with nonuniform flow distribution are reviewed and various flow distribution control methods are evaluated. A two dimensional, turbulent flow model is developed for investigating flow distribution characteristics and diffuser performance. Actual flow distribution data from marine gas turbine exhaust flows is used. A more uniformly distributed flow is obtained by using flow guide vanes combined with flow injection, and an improvement of approximately 20 to 36 percentage points in diffuser efficiency is expected depending on the diffuser geometry considered. MODELING OF TURBULENT MIXING AT DENSITY DISCONTINUITIES IN NONSTEADY COMPRESSIBLE FLOWS Final Report

R. I. Issa Kirtland AFB, N. Mex. AFWL Sep. 1981 35 p refs
(Contract F29601-78-C-0006; AF Proj. 8809)
(AD-A105564; RDA-TR-107605-001) Avail: NTIS HC A03/MF A01 CSCL 20/4

This document describes a theoretical modeling of turbulent mixing at density discontinuities in nonsteady compressible flows. It is shown that when density and pressure gradients are large and have opposite signs (e.g., near the combustion products/air contact surface in blast waves driven by high-explosive sources), flow perturbations will be amplified, leading to local turbulent mixing. The applicability of using a turbulence model to simulate this process is examined. The conservation laws (for mass, momentum, energy and species) are presented in mass-averaged form, the k-epsilon model of turbulence is applied. The relevant term for the generation of turbulent kinetic energy, the term of dominant importance in this problem, is derived by two independent approaches. This generation term is driven by gradients of pressure and density normal to the interface between the high-explosive products of combustion and the shocked air, and not by shear. The present work is thought to represent the first description of a turbulence model for flows driven by such normal gradients. Author (GRA)

DESIGN AND DEVELOPMENT OF A RECIPROCATING LOW-TEMPERATURE FREON EXPANDER

S. J. Hynek, A. C. Harvey, R. L. Demler, D. H. Walker, and H. H. Fuller 1981 17 p Presented at the Inter-Soc. Energy Conversion Eng. Conf., Atlanta, 9-14 Aug. 1981
(Contract W-7405-eng-26)
(DE81-028609; CONF-810812-34) Avail: NTIS HC A02/MF A01

The design and development of a 20-ton refrigeration system to be powered by 140 F waste hot water is described. The system consists of a Rankine cycle driving a reverse-Rankine cycle, integrated in that they share a common working fluid, a common condenser, and a common crankcase housing the expander and compressor. A reciprocating single-acting counterflow expander provides a combination of high efficiency in the desired capacity range, modularity, and adaptability to existing compressors. Because the temperatures and pressures of the Rankine cycle fell within the design envelope of a standard refrigeration compressor, the compressor and expander could be housed within the same crankcase by converting some of the compressor cylinders to expander cylinders by replacing the cylinder heads. LAGRANGIAN FLUID DYNAMICS USING THE VORONOI-DELAUNAY MESH

John K. Dukowicz 1981 30 p refs Presented at the Intern. Conf. on Numerical Methods for Coupled Problems, Swansea, England, Sep. 1981
(Contract W-7405-eng-36)
(LA-UR-81-1421; CONF-810916-1) Avail: NTIS HC A03/MF A01

A Lagrangian technique for numerical fluid dynamics is described which makes use of the Voronoi mesh to efficiently locate new neighbors, and it uses the dual (Delaunay) triangulation to define computational cells. This removes all topological restrictions and facilitates the solution of problems containing interfaces and multiple materials. To improve computational accuracy a mesh smoothing procedure is employed. DOE

RAYLEIGH-TAYLOR STABILITY FOR A SHOCK WAVE-DENSITY DISCONTINUITY INTERACTION

Gary S. Fraley 1981 32 p Presented at the Topical Conf. on Symmetry Aspects of Inertial Fusion Implosions, Washington, D.C., 27 May 1981 Submitted for publication
(Contract W-7405-eng-36)
(DE81-028707; LA-UR-81-2263; CONF-810576-3) Avail: NTIS HC A03/MF A01

The analytic solution for perturbation growth of a shock wave striking a density discontinuity in an inviscid fluid is investigated. The Laplace transform of the solution results in a functional equation, which has a simple solution for weak shock waves. The solution for strong shock waves may be given by a power series. The four independent parameters of the solution are the gamma values on each side of the material interface, the density ratio at the interface, and the shock strength. The asymptotic behavior (for large distances and times) of the perturbation velocity is given. The asymptotic value is given by a constant term and a number of slowly decaying discreet frequencies. The asymptotic velocity at the interface is tabulated for representative values of the independent parameters. For weak shocks the solution is compared with results for an incompressible fluid. The range of density ratios with possible zero asymptotic velocities is given. DOE

FORMULAS FOR ONE-DIMENSIONAL LOCAL PROPERTIES FOR MOLECULAR-DYNAMICS SIMULATIONS OF SHOCK WAVES

R. J. Hardy 8 Jan. 1981 14 p refs
(Contract W-7405-eng-48)
(DE82-000906; UCRL-52972) Avail: NTIS HC A02/MF A01

Formulas are derived for the mass, momentum, and energy densities, the xx component of the pressure tensor P to the xx power, and the x component of the heat flux Q to the x power. The formulas relate these local properties to the masses, positions, and velocities of the constituent particles making up the system and are in a usable form for molecular-dynamics simulations without approximation. The formulas for P to the xx power and Q to the x power avoid the infinite series found in the formulas of Irving and Kirkwood. DOE

INFLUENCE OF WALL ROUGHNESS, ADVERSE PRESSURE GRADIENT AND HEAT TRANSFER ON WALL SHEAR STRESS MEASUREMENTS WITH PRESTON TUBES

Wolfgang Nitsche and Christoph Haberland 1980 45 p refs In GERMAN; ENGLISH summary
(ILR-50; ISSN-0341-0587; ISBN-3-7983-0735-0) Avail: NTIS HC A03/MF A01

Correction functions to the Preston tube calibration curve, accounting for wall roughness, adverse pressure gradient, and heat transfer, were derived, allowing quantitative measurements of local wall shear stress and skin friction in boundary layer flows modified by these parameters. The correction functions were calculated from analytical boundary layer laws and are compiled in tables. Experiments in rough tubes, on plates with positive pressure gradients, and on heated and cooled surfaces confirm theoretical results. Author (ESA)

TESTING OF A WORK BENCH FOR HANDLING OF EXPLOSIVES IN THE LABORATORY [TEST AV ARBETSBAENK FOER HANTERING AV EXPLOSIVAHEMEN PAA LABORATORIER]

Rune Hank, Kjell Johansson, and Leif Lagman Jan. 1981 32 p refs In SWEDISH
(FOA-C-20393-D1) Avail: NTIS HC A03/MF A01

A prototype work station was developed at which jobs can be carried out with explosives up to 10 gr and deflagrating products up to 50 gr. Tests were made to investigate the consequences of a spontaneous accident during work. Conclusions are: the workbench offers good protection against splinters provided the inside walls are coated with a shock absorber; the carbonate glass should be a minimum of eight mm thick; the risk of burns, except on arms and hands, is very low; the bench withstands the explosion with the given weight of explosives (10 gr); the risk of lesions on the lung are very low, for the operator as well as for somebody nearby. A SOLUTION OF THE NAVIER-STOKES EQUATIONS BY A MIXED FINITE ELEMENT METHOD Ph.D. Thesis - Paris Univ.

Marc Bredif 1981 135 p refs In FRENCH; ENGLISH summary Report will also be announced as translation (ESA-TT-720)
(ONERA-NT-1981-1; ISSN-0078-3781) Avail: NTIS HC A07/MF A01

The numerical treatment of steady state, two-dimensional Navier-Stokes equations in the incompressible case is studied. The approximation method retained is the 'mixed' finite element method, as regards stream function and vortex function. The improvements to this formulation are: possibility of choice of boundary conditions of various types; introduction of a finite element formulation of the stagnation pressure calculation; definition of a corrected formulation with a view to studying laminar flows in the case of large Reynolds numbers. The chosen formulation is discussed theoretically, encompassing the aspects mentioned. A solution algorithm is presented, based on a general conjugate gradient method; numerical results are presented for various cases of viscous, incompressible, laminar flows: (1) in a square cavity; (2) around a circular cylinder; and (3) around a NACA 0018 profile at zero angle of attack for Reynolds numbers up to 5000. AN INITIAL STUDY OF THE APPLICATION OF THE NUMERICAL METHOD OF CHARACTERISTICS TO UNSTEADY FLOW ANALYSIS IN PARTIALLY FILLED GRAVITY DRAINAGE SIZED PIPES

John A. Swaffield Jul. 1981 65 p refs Prepared jointly with Brunel Univ. Sponsored in part by HUD
(PB81-229189; NBSIR-81-2308) Avail: NTIS HC A04/MF A01 CSCL 13C

The application of the numerical method of characteristics to the solution of the differential equations defining unsteady flow in partially filled drainage system sized pipes is outlined. The derivation of the flow equations is presented, together with the necessary boundary equation formulation to represent variable inflow, system discharge and leakage flow past a stationary deposited solid. A computer program, written in FORTRAN, is included, together with typical output, that establishes the applicability of this computational method to unsteady flow analysis in gravity flow drainage systems. Proposals for the extension of the described techniques to the prediction of solid transport and flow attsenuation in long pipes are also presented. GRA

HEAT PIPE STARTUP FROM THE SUPERCRITICAL STATE Ph.D. Thesis

Won Soon Chang 1981 212 p
Avail: Univ. Microfilms Order No. 8124285

The transient operation of a Freon-11 heat pipe at temperatures below and near the critical point is studied theoretically and experimentally. A well instrumented test section was designed and fabricated. In the heat pipe regimes the device operated very stably under transient and steady conditions. All inside temperatures in the capillary structure and the vapor space were almost uniform (within 1 K). When high heat load and coolant temperature were applied to the heat pipe, very large temperature gradients occurred throughout, internally and externally. Part of the evaporator was eventually dried out and with more thermal loading the whole capillary structure of the evaporator was dried. The internal temperature distribution, thereafter, diverged along the length of the pipe with increased evaporator temperature exceeding the critical and with decreased condenser temperature approaching the sink temperature. Experiments on cooldown from the supercritical state were carried out to determine the rewetting characteristics of the capillary structure. A computational model for predicting the transient operating characteristics of low-temperature heat pipes is presented. To simulate startup from the supercritical state, a simplified cooldown model was developed using bulk fluid movement with phase-change at the liquid front. Dissert. Abstr.

N82-13401 Purdue Univ., Lafayette, Ind.

COMPUTATION OF UNSTEADY TWO-DIMENSIONAL INVISCID FLOW IN TURBOMACHINERY CASCADES Ph.D. Thesis

Mahmoud Mohamed Kemry 1981 313 p
Avail: Univ. Microfilms Order No. 8123664

A numerical technique was developed to solve the governing equations of motion for unsteady two-dimensional inviscid flow in turbomachinery cascades and applied to the analysis of steady transonic flows in turbine cascades with the steady state solution computed as the asymptotic limit in time of the unsteady solution. The physical plane was transformed to a computational plane to eliminate nonuniform mesh intervals and to simplify the application of the boundary conditions. The full method of characteristics was employed for the boundaries in the leading edge region; the reference plane characteristics method was employed for all other boundaries; MacCormack's method was employed for all interior points. Two cases of turbine cascade flows were solved. The first case involved subsonic flow through the cascade. The second case involved subsonic inlet and discharge flows, but with transonic flow over a portion of the cascade passage. Dissert. Abstr.

N82-13402 California Univ., Los Angeles.

NUMERICAL EXPERIMENTS ON TWO-PHASE LIQUID-VAPOR MIST TRANSPORT Ph.D. Thesis

Jin Young Lee 1981 179 p
Avail: Univ. Microfilms Order No. 8122821

A numerical model of vertical two phase flow of liquid drops in vapor was developed for application to the ocean thermal energy conversion (OTEC) cycle which is proposed to avoid the need of unusually large heat exchangers and/or huge turbines. The analysis consists of three major parts. A one dimensional two fluid model was developed that is able to show the effects of thermal nonequilibrium between vapor and drops. The model was extended to account for collision and coalescence among the drops and can be easily adjusted to the variations in the parameters which enter the collisional model. Two dimensional nonlinear coupled partial differential equations are solved by a finite difference shooting method in parallel with Monte Carlo simulation of drop phase behaviors. Results are obtained for the flow with a periodic disturbance of mist density at injection. Numerical experiments with the model show that the practical maximum net lift for OTEC conditions is about 30 m which is significantly lower than the height obtained from an equilibrium flow analysis and from a collisionless two fluid flow analysis. Dissert. Abstr.

NUMERICAL STUDY OF MULTICELLULAR NATURAL CONVECTION IN VERTICAL CAVITIES Ph.D. Thesis
Yee Lee 1981 142 p
Avail: Univ. Microfilms Order No. 8121818

The structure of the multicellular convection resulting from the hydrodynamic instability of a flow in both a tall vertical rectangular and a tall annular cavity was calculated by finite difference methods. The effects on the flow structure and the average Nusselt number of varying the Prandtl number of the fluid, the aspect ratio of the cavity and the Grashof number were studied. How the curvature of the walls influences the flow patterns in an annulus was also studied. In addition to predicting the right multicellular flow structure at low Prandtl numbers in a rectangular cavity, travelling wave solutions were obtained for water. The results for the flow of a low Prandtl number fluid in an annulus show a multicellular flow structure which drifts upward with a speed which compares well with the experimentally observed value. The heat transfer results for air in tall rectangular cavities have application to double glazed windows and provide a guide to establishing the proper gap width for best insulation. Dissert. Abstr.

N82-13404 Kansas State Univ., Manhattan.
SIMULTANEOUS HEAT AND MASS TRANSFER IN A POROUS MEDIUM Ph.D. Thesis
Hwanghwei Siang 1981 214 p
Avail: Univ. Microfilms Order No. 8122035

Based upon the principle of irreversible thermodynamics, the macroscopic conservation laws of mass, momentum and energy, and equilibrium sorption of the porous concrete system, a set of basic equations for simultaneous mass and heat transfer is developed. An implicit finite difference technique is employed to solve this set of nonlinear partial differential equations. Numerical examples, using the theory developed, are illustrated to deepen the general understanding of the drying, thermal characteristics and related phenomena of hydrated concrete. The developed theoretical model is made nondimensional and an order of magnitude analysis is performed to elucidate the transport phenomenum of heat and mass occurring in a concrete body. In addition to diffusion, both the capillary and evaporation-condensation mechanisms, which are strongly affected by the topology of the porous concrete system, are important in the heat and mass transfer processes. Dissert. Abstr.

MIXING OF A PASSIVE SCALAR IN ISOTROPIC AND SHEARED HOMOGENEOUS TURBULENCE Ph.D. Thesis
Ebrahim Shirani-Chaharsughi 1981 177 p
Avail: Univ. Microfilms Order No. 8124152

In order to calculate the velocity and passive scalar fields in homogeneous turbulent flows, the three-dimensional, time-dependent equations of motion and the diffusion equation are solved numerically. Isotropic, homogeneous turbulence with decay of a passive scalar, and homogeneous turbulent shear flow with a passive scalar whose mean varies linearly in the spanwise direction were investigated. The solutions were obtained at relatively low Reynolds numbers so that all of the turbulent scales could be resolved without modeling. The numerical simulations were carried out on the ILLIAC-4. The pseudospectral method was used for space differencing and the second-order Adams-Bashforth method for time differencing. Turbulent statistics such as integral length scales, Taylor microscales, Kolmogorov length scale, one and two point correlations of velocity-velocity and velocity-scalar, turbulent Prandtl/Schmidt number, r.m.s. values of velocities, the scalar quantity and pressure, skewness, decay rates, and decay exponents were calculated. Also, one and three dimensional spectra of velocity components and scalar quantity, three dimensional spectra of production, dissipation and transfer terms, pressure, Reynolds stress, and heat flux terms were calculated. Some of the results are compared with the available experimental results, and good agreement is obtained. Dissert. Abstr.

N82-13406 Oregon State Univ., Corvallis.
AN EXPERIMENTAL STUDY OF HEAT TRANSFER TO A HORIZONTAL TUBE IN A LARGE PARTICLE FLUIDIZED BED AT ELEVATED TEMPERATURE Ph.D. Thesis
Alan Herbert George 1981 76 p
Avail: Univ. Microfilms Order No. 8124329

Experimental data for the time-average local heat transfer coefficient to a single horizontal tube in a large particle fluidized bed at elevated temperature, are presented. Refractory particles with surface mean diameter 2.14 mm and 3.23 mm were fluidized by combustion products of propane at bed temperatures of 810 K and 1053 K. The particle sizes are near the largest presently used in pilot plant fluidized bed coal combustors. The superficial gas velocity ranged from that required for minimum fluidization, or slightly packed, to the velocity where slugging first occurred, or the highest velocity air blower capacity would allow. Heat transfer results indicate that a stack of defluidized particles remain on top of the tube at low superficial gas velocities. A very low local heat transfer coefficient was obtained under these conditions. There was less than 10 percent difference in the maximum spatial average heat transfer coefficients for the two particle sizes considered. Dissert. Abstr.

LOW ENERGY X-RAY SPECTROMETER
Wayne R. Woodruff 5 Jun. 1981 6 p refs Presented at the Topical Conf. on Low Energy X-Ray Diagnostics, Monterey, Calif., 8-10 Jun. 1981
(Contract W-7405-eng-48)
(DE81-025824; UCRL-85684; CONF-810651-3) Avail: NTIS HC A02/MF A01

A subkilovolt spectrometer was produced to permit high-energy-resolution, time-dependent X-ray intensity measurements. The diffracting element is a curved mica crystal. A carbon X-ray mirror that reflects photons is utilized ahead of the diffracting element. The nominal energy range of interest is 800 to 900 eV. Diffracted photons are detected by a gold-surface photoelectric diode and recorded on an oscilloscope. A thin, aluminum light barrier between diffracting crystal and photoelectric diode detector prevents any uv generated on or scattered by the crystal from illuminating the detector. High spectral energy resolution is provided by photocathodes. The spectrometer was calibrated using Ni L sub alpha 1 2 lines and a molybdenum target X-ray tube. For the latter calibration the carbon mirror was replaced by one surfaced with rhodium to raise the cut-off energy to about 3 keV. The carbon mirror reflection dependence on energy and curved mica crystal diffraction efficiency were measured using X-ray machines. DOE

DEVELOPMENT OF THE HIGH-TEMPERATURE REDOX ELECTRODE AND IMPROVED CORROSION RATE METER Interim Report

M. J. Danielson and O. H. Koski Sep. 1981 38 p refs
(Contract DE-AC06-76RL-01830)
(DE82-000933; PNL-3592) Avail: NTIS HC A03/MF A01

The oxidation-reduction (redox) electrode studies at Pacific Northwest Laboratory (PNL) were completed with the examination of the sulfide-sulfate system. This system is extremely reducing, and it was concluded that the redox electrode would still respond to the entry of oxygen even though sulfide is an oxygen getter. The corrosion rate of platinum in oxygenated brine was determined at 2500 C. It was concluded that the mechanism of response to oxygen fits a mixed potential model. Work began on the improved corrosion rate meter (ICR). A potentiostat and programmer were constructed and successfully tested. Corrosion tests were carried out in 250 C brine with and without oxygen, and the ICR response was very good when compared to corrosion rates determined by weight loss. DOE

IMAGING SYSTEMS FOR FAST ELECTROPHOTOGRAPHIC PROCESSES Final Report
Manfred Lutz, Bernd Reimer, Guenter Baumann, Hans Scheuermann, Harald Stausberg, and Hubert Walsdorfer Bonn Bundesministerium fuer Forschung und Technologie Dec. 1980 160 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-80-183; ISSN-0340-7608) Avail: NTIS HC A08/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 33,60

Image carriers based on amorphous Se-alloys and inorganic-organic multilayer systems were developed for applications in fast electrophotographic processing. The combination of Se photoconductive layers doped with 0.5% As or up to 15% Te with a strain reducing metallic interlayer on a flexible endless Ni-belt is demonstrated to provide the photographical quality and bending strength required by fast reprography. The addition of Te is shown to significantly extend the spectral sensitivity range. Thin flexible foils and belts can also be made out of multilayered systems using Se-alloys and polyrinylcarbazole. It is expected that it will be possible to extend the spectral sensitivity to the near infrared, thereby opening a new area of applications in communication and information systems. Author (ESA)

THREE LASER EXPERIMENTS IN GASES Ph.D. Thesis
Michael Toubert Myers 1981 157 p
Avail: Univ. Microfilms Order No. 8125176

Three laser experiments performed in gases are reported. Four wave degenerate mixing in cesium vapor is described. Its basis in nonlinear optics is explained and a simple set of equations are derived, which predict the resonant behavior, density dependence, and the power dependence of the signal. Inelastic scattering cross sections for the 9D and 10D states of cesium were measured. The observation of cancellation of rotational effects in the intensity of ultraviolet bands of OH are reported. The band oscillator strength for transition in the band of OH was measured and was independent of rotational excitation. This independence is explained in terms of the cancellation of a rotationally induced increase in the Franck-Condon factor by an equivalent decrease in the electronic transition moment.

ATOMIC PAIR PROCESSES AND LASER APPLICATIONS Ph.D. Thesis
George Andrew Zdasiuk 1981 129 p
Avail: Univ. Microfilms Order No. 8124180

Several mechanisms for the emission and absorption of light by atoms and molecules are described. These processes, which are termed pair emission and pair absorption, respectively, enable two colliding atoms (or molecules, ions, etc.) to simultaneously emit or absorb a single quantum of electromagnetic radiation. The photon energy is equal to the sum of the internal energy changes of the colliding partners. The corresponding wavelength is unrelated to the emission or absorption spectrum of the isolated atoms. Explicit expressions are derived for the linear absorption coefficient for pair absorption and the effective Einstein A coefficient for pair emission. Stimulated pair emission and optical gain on pair absorption transitions are also considered. An experiment which demonstrates the use of optically pumped pair absorption transitions in metal vapors for constructing 'pair absorption pumped lasers' is described. This technique may be useful for constructing active optical frequency conversion devices. Dissert. Abstr.

N82-13418 Stanford Univ., Calif.
LASER INDUCED CHARGE TRANSFER COLLISIONS Ph.D. Thesis
Michael Dean Wright 1981 81 p
Avail: Univ. Microfilms Order No. 8124177

Two laser induced charge transfer reactions involving calcium and strontium were studied. In both reactions, a ground state calcium ion collides with a ground state strontium neutral in the presence of a laser field to produce a ground state calcium neutral and an excited strontium ion. The two reactions differ in the final state of the strontium species. The collision cross sections are studied as functions of applied laser frequency and power density. A laser induced charge transfer collisions analysis which follows the Landau-Zener formalism is presented. Dissert. Abstr.

N82-13419 Rochester Univ., N. Y.
INVESTIGATION OF FLUCTUATION PHENOMENA IN DYE LASERS Ph.D. Thesis
Rajarshi Roy 1981 208 p
Avail: Univ. Microfilms Order No. 8124001

The fluctuation phenomena in single mode and two mode dye lasers were studied. A quantum theory of the single mode c.w. dye laser is presented and the connection between the dye laser and the laser with a saturable absorber is examined. The results of photon counting and correlation measurements on the single mode dye laser are discussed. The effect of flow velocity on the photon statistics is also investigated. Photon counting measurements performed on a two mode ring dye laser which verify some of the theoretical predictions are described. Experiments on both the ring dye laser and a two mode standing wave laser are described in which both the average dwell times and their distributions are measured. A comparison of theoretical and experimental results is made. Dissert. Abstr.

SURFACE FAILURE OF CO2 LASER IRRADIATED GLASS
R. W. MacPherson and J.-C. Anctil Apr. 1981 23 p refs
(AD-A105454; DREV-R-4202/81) Avail: NTIS HC A02/MF A01 CSCL 20/5

The possibility of failure of laser heated glass has important implications in experiments on the thermal shock resistance of materials and in the potential applications of lasers to the machining and heat treating of glass. We describe a method of measuring the damage probability distribution function for laser irradiated glass and develop a model to predict the temperature and stress distributions as a function of time. The experiments and model show that for CO2 laser pulse lengths inferior to 1 ms, the mode of failure is by fracture under tensile stress induced during cooling after heating a thin layer near the surface beyond the annealing point. A high-power laser was used to produce shock waves with pressures of 300 to 700 GPa. A series of impedance-matching experiments on aluminum-copper systems with 10% accuracy indicate several areas in which the experiment can be improved to reduce the errors. Several such improvements are now being made, including upgrading both the laser and recording systems and modifying the target characterization techniques. DOE

INVERSE CERENKOV INTERACTION BETWEEN RELATIVISTIC ELECTRONS AND LASER LIGHT Ph.D. Thesis
Wayne Dell Kimura 1981 128 p
Avail: Univ. Microfilms Order No. 8124096

An analysis and experimental verification of momentum modulation of relativistic electrons by laser light using the inverse Cerenkov effect is presented. The laser-induced change in particle momentum; the electron energy density spectrum as a function of the electron and laser beam characteristics; and the dependence of the interaction on the index of refraction are included. A Monte Carlo computer simulation of the interaction process is also given. In the experiment, light at 1.06 micron from a 30 megawatt neodymium yttrium aluminum garnet laser intersected 102 megavolt electrons at an angle of 18 milliradians in hydrogen gas. Possible applications include laser-driven particle accelerators and coherent Cerenkov devices, such as optical klystrons and optical traveling wave tubes. Dissert. Abstr.

Chih-Hung Lee 1981 76 p
Avail: Univ. Microfilms Order No. 8123426

A strain energy development of corrugated plates based on material and geometric properties, along with experimental verification of Huber's results, is presented. All deformations are related to the vertical deflection of the mid-plane, yielding a relationship between the stress and the mid-plane displacement which is absent in the Huber model. Based on these assumptions and thin shell theory, the strain energy was expressed in terms of the mid-plane displacement function. The dynamic equations of motion were then derived utilizing the variational energy principle. These equations were then applied to rectangular, simply supported plates with different height to wave length ratios and solved to determine the natural frequencies and mode shapes. The results were dominated by the unexpected second order derivative term, which determined the failure of this theory. The orthotropic plate equation using the coefficients given by Huber was solved to determine the natural frequencies and mode shapes by utilizing a finite element method. Experimentally, the natural frequencies and mode shapes of the corrugated plate specimens have also been established by a sine sweep excitation of the plate. These experiments used magnetic excitation and an acoustic transducer pickup. Reasonably good agreement was shown between the Huber model and the experimental results. Dissert. Abstr.

LOW-THRUST CHEMICAL PROPULSION SYSTEM PUMP TECHNOLOGY Final Report
R. L. Sabiers and A. Siebenhaar Mar. 1981 201 p refs
(Contract NAS3-21960)
(NASA-CR-165219) Avail: NTIS HC A10/MF A01 CSCL 13K

Candidate pump and driver systems for low thrust cargo orbit transfer vehicle engines which deliver large space structures to geosynchronous equatorial orbit and beyond are evaluated. The pumps operate to 68 atmospheres (1000 psi) discharge pressure and flowrates suited to cryogenic engines using either LOX/methane or LOX/hydrogen propellants in thrust ranges from 445 to 8900 N (100 to 2000 lb F). Analysis of the various pumps and drivers indicate that the low specific speed requirement will make high fluid efficiencies difficult to achieve. As such, multiple stages are required. In addition, all pumps require inducer stages. The most attractive main pumps are the multistage centrifugal pumps. S.L.

(Contract NAS8-33576)
(NASA-CR-161916) Avail: NTIS HC A02/MF A01 CSCL 13I

Machines were constructed and evaluated for burnishing polytetrafluoroethylene on balls for use in the high pressure oxygen turbopump (HPOTP). The most positive performance was obtained with single-ball burnishing, but one technique for burnishing three balls simultaneously holds promise. Evaluations of the coatings in a HPOTP bearing of earlier design (employed smaller diameter balls) showed very little life enhancement before high torque and ball and race wear initiated. Other coating techniques, such as molybdenum disulfide combined with PTFE transfer films, hold promise for providing the more durable quantities of solid lubricant needed for the bearings. A.R.H.

The application of X-ray spectroscopy for monitoring wear-metal particles in lubricating oils is considered. The principles of an energy dispersive X-ray analytical arrangement consisting of radioistope sources or small, thin target, X-ray tubes for excitation in connection with detection for selection of fluorescent X-rays, are explained. Analytical relationships, basic equations, parameters for optimizing the spectroscope setup, and problems concerning the preparation of oil samples are discussed. Experiments with organometallic compounds as standards show that by using radioisotopes and portable, thin target, X-ray tubes, respectively in combination with solid state detectors, wear metals can be directly analyzed in lubricating oil samples at the 1.5 to 20 ppm level (Fe: 1.4 ppm; Pb: 5.0 ppm; Cr: 2.2 ppm; Ni: 3.6 ppm). After collecting thin layers of wear particles on filters, detection limits at the 0.2 to 1 ppm level (10 ml oil samples) can be obtained. Author (ESA)

THE INFLUENCE OF HIGH TEMPERATURE ON BRAKING [INFLUENCE DE LA HAUTE TEMPERATURE SUR LE FREINAGE]
Ricco 1981 21 p refs In FRENCH
Avail: NTIS HC A02/MF A01

Temperatures encountered in brakes are cited, and the importance of the temperature factor to the behavior of brake materials is discussed. Macroscopic aspects of diminishing braking torque are described for certain thermic stages, i.e., failures known as 'low point' and 'fading'. The fundamental causes of these failures are analyzed, linking the thermomechanical properties of brake materials (rigidity and internal damping) to the amount of friction and to instantaneous fluctuations in the tangential force of friction. Results show the effect of a transfer film which forms in function of the thermal stage attained, the material composition, and of the nature of the brake surface.

CYCLIC COMPRESSION, COMBUSTION AND EXPANSION OF A FUEL AND AIR MIXTURE IN A CYLINDER CONTAINING A CATALYST
H. Daneshyar and J. R. Orme 1981 75 p refs
(PB81-232480; CUED/A-THERMO/TR-5) Avail: NTIS HC A04/MF A01 CSCL 13B

The utilization of catalytic ignition and oxidation of a hydrocarbon fuel and air mixture in a four stroke engine was investigated. The effects of the method of aspiration, the cylinder-head design, the catalyst quality and the design of the catalyst mounting structure upon the performance of the engine with specific attention to cylinder pressure diagrams are ellucidated. High speed color photography was employed to provide a recording of the visual observations of the combustion phenomenon present in the cylinder. Measurements of the levels of emissions of carbon monoxide, carbon dioxide, low hydrocarbons and nitric oxide by the infra-red method were made. Interest was centered upon the ability of the engine to operate using very lean air fuel ratios precluded by spark ignition which is advantageous from the viewpoint of emission levels of carbon monoxide, hydrocarbons and nitric oxide. THERMOELASTIC INSTABILITY IN A SEAL-LIKE CONFIGURATION Ph.D. Thesis
Serveswara Rao Kilaparti 1981 136 p
Avail: Univ. Microfilms Order No. 8124923

Thermoelastic instabilities in rubbing contact was studied for simple contact geometries. Thermoelastic instability in sliding contact is shown to be a consequence of interaction of frictional heating, thermal expansion, conduction of heat from the contact zone and wear. Seal-like configuration is investigated for thermoelastic instabilities. Because of the complexity of the problem, it is studied by breaking into subproblems and solutions are obtained for each case. Effects of material properties on critical speed for instability are presented in nondimensional parameters for general applications. Critical speeds for onset of instability are obtained for nominally flat contacting surfaces in the absence of wear. Nonlinear algebraic equations are obtained in terms of material properties and critical speeds which are solved numerically for different hypothetical values of friction coefficients and properties of materials. Materials contacting their own kind are less prone to instability than materials of different kind. Solutions are obtained for stationary configuration with partially contacting surfaces. Dissert. Abstr.

ANALYSIS OF MULTICYLINDER IC-ENGINE CRANKSHAFTS WITH HYDRODYNAMIC BEARINGS USING A FINITE ELEMENT-TRANSFER MATRIX APPROACH Ph.D. Thesis
Victor Hugo Mucino-Quintero 1981 224 p
Avail: Univ. Microfilms Order No. 8124230

A new approach for the load-displacement analysis of IC-Engine crankshaft-bearing systems is described. The analytical model incorporates the elastic and inertial properties of the crankshaft, the flexibility of the supports and the hydrodynamic nature of the journal-bearing systems. The structure of the crankshaft is first macrodiscretized into a number of substructures (crankthrows), which are connected in a chain-like manner. Each substructure is subsequently discretized using a finite element formulation, and the synthesis is made through a new finite element-transfer matrix condensation procedure which eliminates the need to arbitrarily designate the master and slave degrees of freedom typically required in most condensation procedures. The hydrodynamic characteristics of the journal-bearing systems are described using an approximate solution of the governing Reynolds Equation, which is applicable to bearings of finite length. The analysis yields the bearing performance coupled to the crankshaft elastic response for a full load cycle. Dissert. Abstr.

38 QUALITY ASSURANCE AND RELIABILITY

A METHOD FOR ACCELERATING CONVERGENCE TO THE SOLUTION OF NONLINEAR STRUCTURAL EQUATIONS BY REDUCING RESIDUAL WORK Ph.D. Thesis
Cline Turner Young, II 1981 86 p
Avail: Univ. Microfilms Order No. 8123478

Two extrapolation techniques for reducing the number of iterations required for convergence to solution by minimizing the work done by the residual loads are presented. The first technique, a linear scalar extrapolation, is a moderately sophisticated form of line search. The second technique, a multiple search extrapolation, has the capability of changing the direction of search without the expense of factoring the global stiffness matrix. It is possible to reduce the number of iterations required to satisfy convergence for nonlinear structural analysis problems using the linear scalar extrapolation. Furthermore, the cost of each iteration is significantly less due to simplification of the determination of the displacements. It is also possible to increase the level of accuracy for a given number of iterations by superimposing the multiple search extrapolation on the linear scalar extrapolation. The net result of this is to allow a greater incremental load step for fixed convergence criteria. Dissert. Abstr.

N82-13440 Lehigh Univ., Bethlehem, Pa.
INELASTIC OVERLOAD ANALYSIS OF CONTINUOUS STEEL MULTI-GIRDER HIGHWAY BRIDGES BY THE FINITE-ELEMENT METHOD Ph.D. Thesis
Jeffrey Craig Hall 1981 202 p
Avail: Univ. Microfilms Order No. 8118835

An analytical technique for predicting the response to overloads of simple span and continuous multigirder beam slab type highway bridge superstructures made of steel beams and reinforced concrete slabs is described. The nonlinear overload response is obtained by using a tangent stiffness solution process. The analysis scheme also employs the displacement based finite element method of structural analysis, where the superstructure is discretized into a series of beam and slab finite elements, and, in addition, where the elements are further subdivided into a series of layers through their depth. The nonlinearities included in the model are: inelastic stress strain relationships, cracking and crushing of concrete, yielding and strain hardening of steel, buckling of beam compression flanges, and buckling of plate girder webs and compression flanges. Dissert. Abstr.

N82-13441 California Univ., Riverside.
AN EXTENSION TO N DIMENSIONS OF THE VON KARMAN EQUATIONS Ph.D. Thesis
Dave R. Holmes 1981 71 p
Avail: Univ. Microfilms Order No. 8122907

The Von Karman equations for the buckling of a thin elastic plate to three dimensions were extended. The behavior of the three dimensional equations is the same as that of the two dimensional equations with respect to bifurcation from the trivial solution. The equations are extended to n-dimensions and it is shown that their behavior is basically the same as in the two and the three dimensional cases with some minor changes. It is established that an existence theorem for the nonhomogeneous n-dimensional equation does not depend on lambda, the bifurcation parameter, or on the size of the nonhomogeneous term P(x), as long as P(x) is in L2 (omega). Dissert. Abstr.

N82-13442 Purdue Univ., Lafayette, Ind.
MEASURED PAVEMENT RESPONSE TO TRANSIENT AIRCRAFT LOADINGS Ph.D. Thesis
Thomas Dale White 1981 243 p
Avail: Univ. Microfilms Order No. 8123723

Pavement deformation response to aircraft traffic was studied. Linear variable differential transducers (LVDT's) were installed in an active taxiway. The LVDT's were attached to reference rods anchored at 16, 36, 120, and 209 in. Basic pavement responses, information on how pavement layers accommodate dynamic loads, as well as data to compare vertical deformations predicted by a theoretical model were examined. A finite difference solution was used to predict pavement temperatures. The solution is shown to have limited application for predicting pavement temperatures. The pavement response phenomena reported are significant. They expose pavement responses that have been minimized in past research but must now be considered. Current theoretical models used in pavement analysis or design are limited in predicting pavement response phenomena. They do not represent the observed compression and extension in a pavement under and away from actual aircraft loads. Dissert. Abstr.

N82-13443 Purdue Univ., Lafayette, Ind.
AN EXPERIMENTAL STUDY OF A REINFORCED CONCRETE FOLDED PLATE STRUCTURE WITH EDGE BEAMS Ph.D. Thesis
Musa Rahmoun Resheidat 1981 287 p
Avail: Univ. Microfilms Order No. 8123695

An experimental reinforced concrete folded plate structure with edge beams was studied. The influence of edge beams on the structural response is given specific attention. Two models, alike in every respect except for quantity and arrangement of the steel reinforcement are developd and tested. The two reinforcement models designed utilizing the results of an 'exact' linear-elastic analysis method and a slightly modified system based on the same analytical results augmented by limited allowances for traction redistribution at incipient failure. The results of the exact linear-elastic method of analysis provided the basis for a safe, but conservative, design and accurate predictions of structural response for loads in the service load range. Both models failed at load levels well in excess of that required by contemporary strength design criteria. The experimental results indicate that edge beams significantly increased the stiffness of the structure and its load-carrying capacity. Dissert. Abstr.

N82-13444 Purdue Univ., Lafayette, Ind.
ANALYSIS OF STEEL BEAM-TO-COLUMN MOMENT CONNECTIONS Ph.D. Thesis
Kirit Vallabhbhai Patel 1981 212 p
Avail: Univ. Microfilms Order No. 8123688

A study of both beam-to-column flange connections as well as web connections was carried out. Results of tests were used as a bench mark to validate the analytical procedure. An analytical procedure involved modelling of connection using finite element technique for predicting the behavior of the connection. In case of flange moment connections, an analytical procedure was developed to predict the overall behavior of the connections. Calibration of the finite element model of bolted joint was carried out using pilot test on the same joint to justify the model. Analysis results of load-deflection behavior, the stress distribution in the panel zone, and spread of yield zones at different stages of loading were compared with test results. It is shown that the connection behavior can be predicted analytically. In case of web moment connections, the flange connection plate area is analyzed with the help of nonlinear finite element method taking suitable free body out of the connection semblage. Dissert. Abstr.

N82-13445 Stanford Univ., Calif.
A CONTINUUM MODEL FOR FRICTION WITH APPLICATIONS IN METAL FORMING PLASTICITY Ph.D. Thesis
Ibrahim Mahdi AL-Khattat 1981 168 p
Avail: Univ. Microfilms Order No. 8124028

A unified model for the mechanics of generalized friction and a rational treatment of the general solid contact problem in mechanics are developed. A local surface 'strength measure' in terms of geometry-independent limiting shear stress is recognized as the natural measure of generalized friction. An experimental procedure is proposed to determine this measure under controlled levels of uniform loading, temperature, surface roughness and texture, and interface motion, leading to a physically sound basis for standardized tests to measure the frictional properties of solid surfaces, the mechanical properties of lubricants, and the strength properties of adhesives. The physical and operational drawbacks of the Coulomb friction law are discussed and a new formulation of the elastic, viscoelastic, or elastic-plastic discretized boundary value problem involving friction is proposed. At every point of the interface, the boundary conditons are explicitly prescribed either as displacement or traction increments, resulting in a symmetric stiffness matrix in the finite element formulation. Implementation of the proposed frictional model in the increment analysis determines a discretized approximation to the complete state of stress and displacement everywhere on a solid contact surface at every stage of deformation. Three problems in metal forming plasticity are solved with the aid of the frictional model. Dissert. Abstr.

MOMENT-STRAIN RELATIONSHIPS IN ELASTIC-PLASTIC BENDING OF BEAMS

R. V. Milligan Jun. 1981 30 p
(DA Proj. 1L1-62105-AH-84)
(AD-A101722; ARLCB-TR-81025) Avail: NTIS HC A03/MF A01 CSCL 20/11

Bending moment versus depth of elastic plastic interface for both rectangular, tubular, and solid circular beams were developed. Expressions for strain as a function of geometry and depth of elastic plastic interface for each type of cross section are derived. Strain singularity occurring as the elastic plastic interface approaches the neutral axis is pointed out. The assumption that 'planes remain plane' is examined. The basis for determining residual or permanent strains and expressions for their calculation are given. Author

NONLINEAR WAVES IN RODS

Thomas W. Wright May 1981 44 p refs
(DA Proj. 1L1-61102-AH-43)
(AD-A101333; ARBRL-TR-02324) Avail: NTIS HC A03/MF A01 CSCL 20/11

A one dimensional continuum theory with one internal, scalar variable to be used for modeling a solid rod with longitudinal waves is discussed. Rods are simple structures that are often regarded as one dimensional continua, but because of finite transverse dimensions, propagating waves are subject to dispersion, which may mask other effects. The material is assumed to be homogeneous, isotropic, and hyperelastic. The linear theory is reviewed to exhibit the multiple wave hierarchy that exists in a rod; expansion and scaling techniques are used in the fully nonlinear case to examine the main pulse; steady nonlinear waves are examined and it is found that both solitary waves and periodic waves do exist. Results are compared to the wave solutions from the most elementary one dimensional nonlinear theory for rods. Author

HYDRODYNAMIC COMPUTATIONS OF PRESSURES GENERATED BY STEAM PIPE RUPTURE Final Report, 6 Mar. 1978 - 30 Sep. 1978

D. L. Lehto and J. M. Ward 23 Feb. 1981 55 p refs
(Contract NRC-03-78-148)
(AD-A102046; NSWC/TR-80-229) Avail: NTIS HC A04/MF A01 CSCL 20/11

Calculations were made to determine the pressure loads generated by the impact of steam jets from a broken process pipe upon the inner wall of a surrounding concentric guard pipe. Longitudinal and circumferential breaks were considered, with various guard pipe diameters. The data obtained can be used in designing guard pipes for high-pressure steam process pipes. Circumferential and longitudinal 12.7 mm (0.5 in) and 50.8 mm (2.0 in) wide breaks in a 0.914 m (36 in) outside diameter process pipe carrying 8.3 MPa (1200 psia) process pipe and the guard pipe ranged from 12.7 mm (0.5 in) to 152.4 mm (6 in). The entire flow fields, including shock waves, were calculated with a two-dimensional hydrocode. The main loading on the guard pipe was determined to be the steady-flow pressure generated subsequent to the process pipe rupture. This pressure drops rapidly as the pipe spacing is increased, so from the standpoint of steam jets, pipe spacings of several inches are desirable. N.W.

LARGE AMPLITUDE COMPRESSION AND SHEAR WAVE PROPAGATION IN IMPACT-LOADED PMMA Final Report, 1 Jul. 1978 - 30 Sep. 1981

Y. M. Gupta Oct. 1981 7 p
(Contract DAAG29-78-C-0030)
(AD-A105953; ARO-15513.2-E) Avail: NTIS HC A02/MF A01 CSCL 20/11

The goal of this research was to develop an improved understanding of the high strain rate material response of polymers by studying the propagation of large-amplitude, one-dimensional compression and shear waves in impact-loaded polymethyl methacrylate (PMMA). Experimental techniques were designed and developed to permit measurement of large-amplitude shear waves. Measurements were made of the shear particle velocity at the impact surface and in the sample interior. The measurement of shear wave velocities permitted the first determination of the shear and bulk modulus in the shocked state. The shear wave profiles measured at several gage locations in the sample were integrated (using a Lagrangian analysis for compression and shear waves) to provide shear stress-strain response in the shocked state. These results are the first of their kind and provide an important constraint on the shear (or deviator) response of the material. Author (GRA)

ASYMMETRIC STRESS AND FAILURE ANALYSIS

J. Yu and R. Westmann [1981] 6 p refs
(Contract DE-AT03-76SF-74016)
(DE81-026842; DOE/SF-74016/T3) Avail: NTIS HC A02/MF A01

The cladding failure due to asymmetric structural response of the fuel cell is studied. The fracture and cracking patterns prior to the development of fuel-cladding contact and the forces in the cladding after fuel-cladding contact has been made are investigated. DOE

APPLICATION OF THE THEORY OF LINEAR ELASTIC MATERIALS WITH VOIDS

Stephen C. Cowin, Jaco W. Nunziato, and Pratap Puri (New Orleans Univ.) 1981 12 p refs Presented at the 4th Intern. Conf. on Continuum Models of Discrete Systems, Stockholm, 29 Jun. 1981
(Contract DE-AC04-76DP-00789)
(DE81-027903; SAND-81-1139C; CONF-8106133-1) Avail: NTIS HC A02/MF A01

The linear theory of elastic materials with voids is summarized and some applications are sketched. The theory differs from classical linear elasticity in that the volume fraction corresponding to the void volume is taken as an independent kinematic variable. The following applications of the theory are described briefly: response to homogeneous deformations, inflation of a cylinder and sphere due to internal pressure, pure bending of a beam, and small amplitude acoustic waves. In each of these applications, the change in the void volume induced by the deformation is determined. DOE

ANALYSIS OF STRESS DROP IN MULTISTAGE CREEP EXPERIMENTS: PREDICTIONS OF EXPONENTIAL CREEP LAW
W. Herrmann and H. S. Lauson Aug. 1981 22 p refs
(Contract DE-AC04-76DP-00789)
(DE81-029279; SAND-81-1612) Avail: NTIS HC A02/MF A01

Multistage creep experiments in which the stress or temperature are increased stepwise were successfully analyzed using an exponential transient creep law. The analysis is generalized and implemented for an arbitrary number of stages including stress and temperature drops. Under certain conditions the simple exponential creep law, evaluated from data for stages following increases in stress and temperature, predicts inverted transients for stages following decreases in stress or temperature. Comparisons of predictions with limited experimental data suggest that the simple exponential creep law is inadequate, and that separate hardening and recovery processes need to be modeled to handle stress or temperature drops. PRESSURE MEASUREMENTS OF NON-PLANAR STRESS WAVES
G. H. Carlson and J. A. Charest (Dynasen, Inc.) 1981 24 p refs Presented at the 1st Symp. on Gages and Piezoresistive Mater., Archon, France, 29 Sep. - 1 Oct. 1981
(Contract W-7405-eng-36)
(DE81-028729; LA-UR-81-2343; CONF-810931-1) Avail: NTIS HC A02/MF A01

Nonplanar stress wave pressure measurement using thin piezoresistive gages requires correcting for induced strain parallel to the sensing elements. A dual element gage is developed that permits such measurements. Manganin is sensitive to parallel and perpendicular to the sensing element. Constantan is change is sensitive to stress parallel to the sensing element. The change in resistance in the Constantan element is used to correct for the strain effect parallel to the Manganin element axis. The Manganin-Constantan dual element gage is used in the differential recording mode to yield pressure. The gage is a strain compensating gage in this mode. DOE

BEHAVIOR OF PLANE PANELS IN SHIP STRUCTURES WITH LOCAL INITIAL DEFLECTIONS [TRAGFAEHIGKEIT VON E BENEN SCHIFFBAULICHEN FLAECHENTRAGWERKEN MIT OERTLICHEN VORVERFORMUNGEN]
H. Petershagen Bonn Bundesministerium der Verteidigung 1980 156 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium der Verteidigung
(BMVg-FBWT-80-18) Avail: NTIS HC A08/MF A01; DOK-ZENTBw, Bonn DM 40

The influence of deformations resulting from welding stresses on the carrying capacity of plate panels were studied theoretically and experimentally. Buckling tests were made with two longitudinally and transversally stiffened plates under longitudinal compression combined with inplane shear and lateral load. The test results are compared with the predictions from nonlinear plate theory. The theoretical stress analysis is based on a model: one involving application of the energy method, and a model using finite element techniques. Results show that the initial deformations affined to the buckling modes have the greatest influence. The finite element idealizations do not lead to improvements as compared to the results from the energy method. Author (ESA)
